The method of electing the members of the Council of States was not fixed in the constitution and varies from canton to canton. At first generally elected by the cantonal legislatures, they are now chosen by secret popular vote in seventeen cantons, by the *Landsgemeinde* in four and by the cantonal legislatures only in four. Their term of office varies from one year in five cantons to four years in one. In eighteen cantons the term is three years.

Despite the growth of the influence of the executive the development of the federal civil service and the extension of the jurisdiction of the Federal Tribunal the revised constitution of 1874 like that of 1848 declared that the Federal Assembly possessed "the supreme authority of the Confederation," and expressly charged the Assembly with the duty of "dealing with all matters within the competence of the Confederation which have not been entrusted to another federal authority." In practice the Federal Assembly is much more than a mere lawmaking body. Besides its legislative functions, which it shares with the people, it has executive and judicial duties. As an executive organ it is respon-

sible for the army, whose commanding general it elects in case of war; for the granting of subsidies and concessions; and for the supervision of the Federal Council, or federal government, whose members it elects every four years and whose administration it controls on the basis of an annual report submitted to it by the council. As a tribunal it settles disputes of public law and is the final judge of the constitutionality of its own legislation.

The two houses always sit simultaneously and as a rule in public. The constitution provides for one ordinary session annually and for extraordinary sessions at the request of the Federal Council, of a quarter of the members of the National Council or of five cantons. Since the World War the Federal Assembly has met four or five times yearly for sessions of an average duration of three to four weeks each. Joint sessions of the two houses are exceptional. They take place under the chairmanship of the president of the National Council to elect the government, the federal tribunals, the chancellor of the confederation and the commanding general and to consider certain judicial matters. Except for the fact that the National Council, being more numerous, dominates the Federal Assembly when in joint session the constitution provides for the absolute equality of the two houses. Neither enjoys any special rights or privileges. All legislation, including the annual budget, may be introduced first in either house and cannot become operative until agreed to by both. Although there is no constitutional way out of a deadlock, in practise no deadlock has ever proved very troublesome.

The legislative initiative belongs to the government, to each member of both houses and to any canton by correspondence. The rules of the Federal Assembly restrict the exercise of this right of its members to the presentation of motions inviting the government to formulate bills for legislative approval. Members of the government, who cannot belong to either house, may and constantly do participate in the debates on bills. In each chamber half the members constitute a quorum. All votes are taken by majority of the deputies present, voting by proxy being unknown.

In spite of its exceptionally strong constitutional position the Federal Assembly is relatively weak when compared to most foreign parliaments. This is due mainly to the permanence of tenure and consequent strength of the Federal Council. As the members of the government are

in practise always reelected and as members of the Assembly are not expected to devote themselves exclusively to their legislative duties, the former are in their dealings with the latter in the position of professional experts addressing amateurs. The permanence of the government has led to a corresponding lack both of executive ambition and of executive experience on the part of the Federal Assembly. As the Assembly usually includes no former members and but very few future members of the federal government, its function in fact often resembles that of an advisory rather than of a sovereign body. Government measures are seldom seriously amended and still more seldom rejected by the legislature, which in this respect has always shown itself far more docile politically than the people at the polls. The success of the referendum in Switzerland is both a cause and a consequence of this extreme parliamentary docility.

The same is on the whole although perhaps to a less extent true of the cantonal legislatures, all of which are unicameral. They vary in size from 51 in Nidwalden, the smallest canton, to 230 in Berne, the largest. Of the 25 cantonal legislatures, 17 are elected by proportional representation and 8 by majority vote. The basis of representation ranges from 250 in two small cantons to 3000 in Berne. The term of cantonal legislatures ranges from one year to six years, the most common being four years. The sessions of most cantonal legislatures are short and correspondingly numerous, so that their members, who are drawn from all walks of life and are never professional politicians, may attend without neglecting their own affairs.

W. E. RAPPAUD

THE NETHERLANDS. The States General of the Kingdom of the Netherlands is descended historically from the States General of the Republic of the United Provinces of the Netherlands (1581-1795), from which it differs, however, in several important respects. The earlier assembly in turn was similar in structure and functioning to the provincial states, from which it derived its authority.

The provincial states were the representatives of the municipalities, the nobility and the clergy, summoned by the sovereign of the county or duchy to pass on important questions, such as the succession to the throne and the voting of taxes, especially for wars. The organization of the states varied in the different provinces and in the same province from time to time. After the

Reformation the influence of the clergy declined. The nobility was most influential in Gelderland and Utrecht and least so in Holland, which was by the sixteenth century the richest and most important province. In the northern provinces the rural districts possessed significant representation. In general each town had only one vote but might send as many deputies as it chose; the deputation merely expressed the will of the town and in important cases referred the matter back to the municipalities (*vroedschappen*) for their decisions. Each town was bound only by its own vote. Essentially then the provincial states represented a loose confederation of sovereign municipalities.

As several provinces came under the control of a single person, states were sometimes summoned for two or more provinces. The most important of these joint assemblies was that of Holland and Zeeland. In 1465 Philip the Good, having acquired almost all the Netherlands provinces, summoned representatives of all the states of the Low Countries to a States General to recognize his son as his successor and to vote supplies for a war with France. Until 1477 the States General was an irregular organization, which came into existence only at the call of the sovereign. In that year the Great Privilege, among other concessions, gave to the States General the right to convene on its own motion and to pass upon declarations of war and the marriage of the sovereign. The provincial states by separate grants also acquired the right to meet at their own wish. But the provisions of the Great Privilege were frequently violated by Maximilian and definitely abrogated by Philip the Fair in 1494. The States General was summoned increasingly frequently but only at the will of the sovereign and to consider his requests for supplies. Control of the purse was utilized by the States General, however, as a means of obtaining redress of grievances from the government, which was largely in the hands of foreigners. A proposal to institute in the Netherlands a form of permanent sales tax, similar to the *alcabala* (*q.v.*) in Castile, which would have made the sovereign independent of the States General, was rejected by that body in 1569. After the abjuration of Philip II in 1581 the States General functioned as the principal central organ of government for the highly decentralized republic.

The States General under the republic functioned like the early provincial states, except that its sessions were permanent. Each province had only one vote, by which alone it could be bound

in important matters; the deputations, chosen by the provincial states, were sworn to act in the interest of their mandators; they had to follow instructions and refer all important disputable matters back to the provincial states. Since the latter were ultimately controlled by the municipalities, under the republic it was in the *vroedschappen* that real political control ultimately resided. The States General, dominated by Holland, which bore the greatest tax burden, appointed the officials of the republic and controlled foreign affairs, the army and navy and finances. The executive body of the republic was the Council of State (*Staatsraad*), the members of which were chosen by the provincial states but took an oath to act in the general interest; the council prepared the military budget and its allocation among the provinces, but the consent of each province was required for its particular levy.

After the defeat of Napoleon had restored to the Netherlands the independence taken from it in 1795, a new States General was set up in 1814. It was a bicameral legislature, with a First Chamber nominated by the king and a Second Chamber by the provincial states. But, unlike the old States General, the members of the new were forbidden to consult with their mandators and were sworn to follow their own conscience and to vote in the general interest. This change marked the definite shift of legislative power to the States General. In 1848 direct election of the members of the Second Chamber and of the provincial states and election of the members of the First Chamber by the provincial states were introduced. In 1917 universal suffrage for men and women was introduced for the election of members of the municipal councils, the provincial states and the Second Chamber of the States General. The First Chamber can neither initiate nor amend legislation but must accept or reject it as presented. A proposal to abolish the First Chamber failed in 1922, but the matter is still occasionally agitated. The *Staatsraad* continues as an advisory body to the government on all legislative matters and acts as an intermediary between the sovereign and the Second Chamber.

The States General has the right of inquiry, and its commissions if authorized by the assembly can compel testimony and the production of papers. Individual members possess the right of interpellation and the usual parliamentary privileges and immunities. Members of the cabinet may sit in either Chamber and answer questions but cannot vote unless members of the particular Chamber. Before the World War both cham-

bers followed the French system of committees: each Chamber divided into five sections by lot; for each particular measure each section chose one member; he reported to his section, which then debated the measure. This system is still used in the First Chamber, but since the World War the Second Chamber has tended increasingly to use standing committees, chosen not from the sections but by the president of the Chamber or by the plenum; these committees report directly to the Chamber and disregard the sections entirely.

Ministerial responsibility to parliament was conceded in the constitution of 1848 and until the World War governments were practically responsible to the Second Chamber; the veto power possessed by the king was rarely employed. During the war and post-war periods the functioning of ministries on the basis of a majority support in parliament proved almost impossible and the country was ruled largely by extraparlimentary ministries which revived the monarchical veto.

A. C. JOSEPHUS JITTA

SCANDINAVIAN STATES AND FINLAND. *Sweden.* Popular representation in Sweden dates from 1435, when for the first time representatives of the various social classes met in a national assembly, or Riksdag (day of the realm), to consult with the regent on affairs of state. Such meetings were held sporadically thereafter, being summoned usually only in emergencies when the king needed popular support against the nobles or some foreign power. Not until the seventeenth century under Gustavus Adolphus was the composition of the assembly fairly definitely fixed; it consisted then of representatives of the four estates: the nobility, the clergy, the burghers and the peasants. Its procedure was defined also during this period and its authority increased. During the so-called age of freedom (1718-72) the Riksdag held a dominant position in the government and a parliamentary system was applied, although it was controlled more by the central bureaucracy than by the people. The parliamentary system survived even the revolution of 1772, by which Gustavus III ended the supremacy of the Riksdag.

Even after the great constitutional reform of 1809-10, which brought about a balanced rule between king and people, the organization by estates was maintained. It was finally abandoned in 1866 with the institution of a two-chamber system, which has gradually been made more

democratic, the last time by the constitutional changes of 1918-21.

The 150 members of the First Chamber are elected indirectly for eight years, in such a way as to give the Chamber new members each year, by provincial assemblies or in the cities by electoral bodies chosen by all men and women over twenty-seven years of age. The 230 members of the Second Chamber are elected directly for four years by all men and women over twenty-three years of age. Proportional representation applies in the elections to both chambers.

In power and in actual influence the two chambers are practically equal. If they differ on financial questions, however, they must vote jointly, a procedure which favors the Second Chamber. In recent years the First Chamber has once caused a resignation of the cabinet (the Branting ministry in 1923) by defeating a government bill. Financial supervision over the administration is maintained through an elected committee of revisers, which works between legislative sessions. The minutes of cabinet meetings are checked by a parliamentary committee, and ministers who have acted illegally can be cited before a national court composed of high officials. Finally, the Riksdag can apply to the king for dismissal of members who have given bad advice. In practise these methods of enforcing responsibility are no longer used. It is customary, however, for the Committee on the Constitution to criticize specific governmental acts, which are later debated in the Riksdag. The Swedish committee system is peculiar in that the more important committees, seven in number, for which the constitution provides, are shared by the two chambers, containing as a rule from 8 to 10 members from each. The Swedish practise of not admitting cabinet members to the committees is also unusual.

Norway. The Norwegian parliament, or Storting, instituted by the constitution of 1814 consists of a single chamber of (since 1919) 150 members elected by the proportional system by the votes of all men and women over twenty-three years of age. One third of the mandates are assigned to the cities and two thirds to the country districts, a rule which has hitherto favored the cities. Even during the union with Sweden (1814-1905) the Storting acquired great influence over the government and since the dissolution of the union the parliamentary system has prevailed, although the constitution does not provide for it. The Storting enjoys unusually

wide powers; the monarch has no power of dissolution and in legislative matters only a suspensive veto.

As in Sweden minutes of cabinet meetings are inspected by a Storting committee. If it appears that cabinet ministers have made unconstitutional or obviously harmful decisions they may be summoned before a national court composed largely of Storting members. Such a case occurred most recently in 1926-27 but ended in an acquittal. In the handling of most questions the Storting is divided into two sections, the Lagting, elected by the Storting and consisting of one fourth of its members; and the Odelsting, made up of the remaining three fourths. Legislation is taken up first by the Odelsting. If the Lagting does not approve its decision the entire Storting meets and gives a final verdict, for which a two-thirds majority is required. There are seventeen permanent committees with definite assignments. In practise cabinet ministers may by special request attend the meetings of legislative committees.

Denmark. The composition of the representative assembly instituted in Denmark in 1849 has undergone various changes. It is divided into two chambers, Landsting and Folketing, both elected by the proportional system. Since 1915 three fourths of the 76 members who compose the former have been chosen by direct vote of all men and women over thirty-five years of age; the remaining 19 members are elected by the Landsting itself. The term of all members is eight years. The 149 members of the Folketing are chosen for four years by direct vote of all men and women over twenty-five years of age. Twenty-four seats are set aside to be allocated after the election to those political parties which have not secured representation proportionate to their voting power. In principle both chambers are of equal rank; but the Folketing actually has the greater power, exercising decisive control over the government. Financial measures are first introduced in the Folketing, going to the Landsting so late in the session as practically to nullify the latter's right to make changes. The Folketing can cite ministers before a court composed of judges and representatives of the Landsting. At the democratic reformation of the representative system in 1915 a rule was introduced that the Landsting may be dissolved only if it rejects a measure which has twice been adopted by the Folketing, the second time after regular new elections. The Folketing, on the other hand, may be dissolved at any time. This has happened

several times in recent years when there has been no clear majority.

At least five permanent committees are appointed in the Landsting at each session and six in the Folketing; these committees are composed of 5, 7 or 9 members. Each chamber has furthermore a budget committee of 15 members. The competencies of these committees are indistinctly indicated; special committees are often appointed to consider important proposals. Ministers frequently attend committee sessions, although there is no fixed rule.

Finland. During its union with Sweden, Finland had no special legislative representation. The Russian conquest was followed by the summoning in 1809 of an assembly composed of representatives of the four estates, nobility, clergy, burghers and peasants. After 1863 this assembly was convoked regularly but there was no definite division of powers between it and the regent (the Russian emperor). In 1906 a thoroughly democratic reform was instituted, with an assembly composed of 200 members chosen for three years according to the proportional system with universal suffrage for men and women over twenty-four years of age.

When Finland became independent in 1917 the legislature took over all powers of government and in 1919 adopted the present constitution, which provides that the government must enjoy the confidence of the legislature and makes that body the center of Finland's political life. A committee of the legislature, the Constitutional Committee, checks upon the official acts of the ministers; when illegal acts are discovered the legislature may summon cabinet members before a national court composed of high state officials and legislative representatives.

The president has on two occasions, in 1924 and 1930, used his right to dissolve the legislature and order new elections. These dissolutions, however, were brought about not by any real political conflicts but by special circumstances (in 1930 the so-called Lappo movement) which made new elections desirable.

The legislative committees are of great importance. Besides the five special committees which must have from 11 to 21 members, each appointed to handle different groups of subjects, there is the so-called Great Committee composed of at least 45 members. The functions of this committee resemble in some respects those of the Norwegian Lagting. After a bill has been discussed in its appropriate special committee and in the legislature itself it goes to the Great

Committee. The legislature cannot take final action until this committee has reported. Under a special rule ministers may attend committee sessions unless the committees vote to exclude them.

The legislative assemblies of all the Scandinavian states have certain traits in common. The number of professional politicians in them is relatively small, the electors to a great extent choosing representatives of their own social classes. About half the members of the Swedish Second Chamber, for instance, are either farmers or manual workers; the same situation exists in the other countries. The debates are characterized by a matter of fact tone; brilliant oratory or personal attacks are unusual. Committee sessions are of great importance, probably because of the fact that minority governments have been common. The decisive negotiations between parties take place in the committees, where the necessary compromises are prepared. Although the legislatures have been criticized at times for incompetence and logrolling, their prestige is comparatively high and there is little opposition to the representative system. Charges of corruption are rare.

HERBERT TINGSTEN

HUNGARY. The origin of the Hungarian Parliament is at present a highly controversial question. According to the most recent theory the Hungarians originally had the same patriarchal and autocratic form of legislation as the other Mongolian peoples, the Huns, Avars and Turks. The conversion of the Hungarians to Christianity and the marriage of the first Hungarian king, St. Stephen, to a Bavarian princess were followed by the influx of a large number of German knights and the introduction of German (Frankish) institutions. The king before legislating was now required to ask the advice of his council (*senatus*), consisting of the *principes regni*, but he was free to act as he pleased. The statute of 1291 (sect. xxxi) already speaks of the custom of the barons and noblemen to assemble annually. The influence of this body gradually increased as a result of the occasional youth or weakness of the king and especially as a result of the necessity of electing a new king whenever the king died without a natural heir. The nobility, both higher and lower, originally sat together as one house; but the statute of 1608 (*post coronationem*, sect. i) brought about a separation into two houses: the Chamber of Magnates, comprising the higher nobility and the

clergy, and the Chamber of Deputies, comprising chiefly delegates of the nobility from the several counties and delegates from the royal free cities.

The Diet as so constituted had very few of the attributes of a western parliament. The lower house did not represent the commons, as in England, but chiefly the lower nobility. While all bills (not merely financial bills) had to originate in the lower house, the upper house had an absolute veto power. There was no principle of ministerial responsibility, the power of the king was correspondingly great, and at times the function of the Diet was reduced to the registering of royal decrees.

In 1848 through the introduction of a responsible ministry and the enlargement of the electoral base of the lower house the Diet was transformed into an institution resembling a modern parliament. Ministers could be impeached by the lower house and tried in the upper house, and the right of interpellation was granted to both houses. By custom an adverse vote in the lower house required the dissolution of the ministry. Although the veto of the upper house was legally absolute, by custom the power over money bills tended to rest in the lower house, the magnates seldom voicing their opposition more than once to a financial measure which the lower house persisted in passing. The power of the monarch although diminished continued very strong. The government was required by custom to consult the king before proposing measures to the Diet and his final veto power was always more than a mere formality. Through the compromise of 1867 with Austria the conduct of foreign affairs, army and finances for the joint affairs of the dual monarchy were reserved to special joint ministers responsible to two delegations elected respectively by the Austrian and Hungarian parliaments.

Although the electoral base of the Chamber of Deputies was increased in 1848 from 200,000 voters to 800,000, even the higher number represented only 7 percent of the population. The proportion of voters to population decreased slightly during the seventy years ending in 1918, and the Chamber of Deputies thus remained essentially an assembly of the nobility. With the coming of the twentieth century there were to be sure more deputies of non-noble birth, but even these newer elements—industrial and financial capitalism and the higher bureaucracy—readily followed the guidance of the nobility. The composition of the Chamber of Magnates,

on the other hand, was altered scarcely at all after the seventeenth century, the only important change being the act of 1885 providing for the appointment of a certain number of life members by the king and for the exclusion of magnates whose land tax was less than 3000 florins (about \$1200). On the whole it may be said that during the entire reign of the Hapsburgs the Hungarian Diet served as a fighting organ of the landowning nobility, directed on the one hand against the absolutism of the dynasty and on the other against the rising lower classes—the minority nationalities, the peasantry and the industrial laborers.

After the World War the republican Karolyi government projected a unicameral legislature with a greatly extended franchise, but the regime was overthrown before any elections could be held. The succeeding Soviet government held sham general elections for a National Congress of Soviets. But with the collapse of communist rule the pre-war constitutional regime was restored (except that a regent occupied the place of a Hapsburg monarch) through the agency of a National Assembly convoked in 1920 on the basis of a fairly general and secret ballot. A Second National Assembly, convoked on a more limited ballot, laid down the electoral regulations for the present legislature. Despite the fact that the National Assembly had functioned *de facto* as a unicameral legislature, it was voted to restore both houses in the definitive regime. The reason for this step was the desire of the conservative parties to insure their rule through an extra bulwark of protection in addition to that afforded by a restricted franchise in the lower house.

The Chamber of Magnates now comprises all Hapsburgs living in Hungary (4), members elected by members of the former Chamber of Magnates (38), representatives of the churches (31), *ex officio* members (12), delegates of scientific and economic institutions (35), representatives of municipalities—counties and cities—(76), members nominated by the regent (40). The mandate of the elected members is for ten years.

The electoral base of the Chamber of Deputies now includes 58.4 percent of the whole population. Male voters must be twenty-four years old and have four years of school instruction; female voters unless university graduates must be thirty years old and have six years of school instruction or four years instruction and three or more legitimate children or be self-

sustaining and have their own household. The signature of 10 percent of the voters of a district is necessary for nomination. As the acceptance of the validity of signatures depends on the good will of the local administration as well as on the liberty of canvassing, this provision works to suppress any manifestations of independent public opinion. It accounts for the uninterrupted reign of the same government from 1922 to 1931 and for the fact that the opposition is limited to 14 Social Democrats and 9 Democrats.

Because of the resort to a regency the power of Parliament may be said to have increased somewhat under the post-war regime. The regent, who was chosen by the first National Assembly and who in the future is to be chosen by the joint assembly of the two houses of Parliament, may be impeached by the lower house and tried by a high court selected from the upper Chamber. He possesses only a limited veto. Of the two houses the lower house continues as before the war to be the more influential. Special powers have been granted to the Chamber of Deputies to override the veto of the Chamber of Magnates in regard to money bills. As in England the power of the legislature as a whole is not restricted by any written constitution, the constitutional provisions not differing from other legislative acts and all acts requiring a simple majority for passage. The development of detailed legislative procedure and standing orders, as formulated December 19, 1928, has been mainly along Franco-Belgian lines.

The prestige of the legislature has always been considerable. Members enjoy high social standing as well as great advantages before administrative authorities. During the First and Second National Assemblies (1920–26), when the wealthier peasantry and the lower middle class generally made considerable inroads, this prestige declined somewhat. But as these elements have since been very much reduced, the Chamber of Deputies is now again, although in lesser degree, the assembly of "gentlemen" which it was before the war. Out of 245 members there are 29 counts and barons and about 100 belong to the untitled nobility. The industrial laborers of Budapest have their representatives in the legislature, but the great masses in the country, particularly the peasants and the laborers, are scarcely represented, because of the prevalence of the open ballot, the electoral procedure and the interference of the administration at elections.

ROBERT BRAUN

SPAIN AND PORTUGAL. *Spain.* In mediaeval times a cortes, or assembly of states, existed in each of the large political entities of the peninsula under Christian control; such assemblies continued to exist when aggregation around the crowns of Castile and Aragon produced general cortes for these realms. In Castile, however, the regional assemblies disappeared in the second half of the fourteenth century, while the general cortes of the crown of Aragon met only on extraordinary occasions to treat questions of interest to all the component states. Aragonese expansion resulted in the establishment of a cortes in Sardinia and in the introduction of Aragonese features into the Sicilian parliament. The origins of the Cortes have not been satisfactorily determined. More or less plausible but unproved is the hypothesis whereby it is derived from the full or extraordinary sessions of the Curia Regia, a consultative body possessing in fact many functions of secular and ecclesiastical government, which existed in León in the early centuries of the reconquest and later acquired feudal characteristics. The classical theory derives the Cortes ultimately from the late Visigothic councils of Toledo, which were attended by the highest church officials and by high dignitaries of the state, who were at the same time outstanding members of the nobility; their specific function was ecclesiastical, although the king might submit secular affairs to them for deliberation. Such fundamental differences of composition and function, however, exist between council and Cortes as to make this theory inadmissible. Although the cortes were attended by the higher nobility and higher clergy, the essential element in their composition consisted of procurators representing the cities and towns under the rule of imperative mandate; in Castile frequently they alone were summoned. The powers and functions of the cortes varied with the place and the time. In judicial theory they were merely consultative and deliberative organs unable to limit the power of the king, except that it was their prerogative to vote taxes and approve financial subsidies sought by the crown. The latter were the chief and characteristic functions of the Castilian cortes. In actual fact, although the Aragonese assemblies were the more powerful, the cortes in both realms intervened in questions of succession to the throne, the regency, legislation, internal administration and foreign policy, particularly during the thirteenth and fourteenth centuries. In Aragon originated a feature which spread widely and which has

modern parallels, the *diputación*, or committee, chosen from the various estates to keep watch over the king between sessions and to enforce obedience to the laws.

In the first half of the fourteenth century began the decline of municipal autonomy, aided by the jurists' adoption of the absolutist principles of the Roman law and by the crown's corruption of the elections of the procurators. Consequently the prestige of the cortes waned; they met less frequently and the scope of their competency was restricted. From the time of Ferdinand and Isabella they virtually ceased to exist as a functioning organ of government and from the time of Charles I and Philip II they met only on very exceptional occasions and seldom intervened in important problems. The legal situation, however, remained unchanged. In the eighteenth century local revolts and Bourbon centralization led to the suppression of the regional cortes and the establishment of a single body for Spain, but in Navarre the cortes survived until the early years of the nineteenth century.

Although the introduction of the constitutional regime at the beginning of the nineteenth century revived the Cortes, its spirit, organization and functions were radically changed. While its composition in certain respects resembled that of previous assemblies, the Cortes of Cadiz, meeting as the representative body of a nation which had assumed the sovereignty in its revolt against Napoleonic imperialism, in 1812 promulgated a constitution modeled largely upon the French constitution of 1791. The new constitution established the principle of separation of powers and vested the legislative power in a unicameral parliament. The restoration of Ferdinand VII marked the beginning of a stormy period for the new Cortes, which succumbed repeatedly to the bad faith of the monarchs, who were supported by an ignorant population. Its structure and powers were frequently affected by the vicissitudes of struggles between parties supported only by sections of the army and by certain other minorities. In 1834 a royal statute replaced the constitutional Cortes with two *estamentos*, or estates, possessing hardly any power except the right to petition the absolute monarch. The reintroduction of the modern Cortes as a bicameral body in 1837 was followed by a struggle—the effects of which are displayed in the constitutions of 1845 and 1869—over the composition of the Senate. Under the last monarchist constitution, that of 1876, the issue be-

tween king and parliament was never really settled; but a compromise with respect to the Senate was reached by providing for members who were either to be so in their own right or to be chosen by the king for life as well as for members elected by universities, academies, societies for the furtherance of economic development, ecclesiastical corporations and provincial authorities and by electors chosen by local government officials and the higher taxpayers. For the directly elected Congress of Deputies universal manhood suffrage was not adopted until 1890. In the Cortes of Cadiz representatives sat for the American colonies. After the loss of the bulk of the latter the Antillean territories maintained their representation, although not consistently; but they seldom affected legislation. Until 1918 the committee organization of the two chambers was modeled upon that existing at one time in France: the chambers were divided by lot into sections which gave bills preliminary readings and then, if they favored further consideration, elected a representative to a special committee to report on the particular measure. Elected generally in the same manner were a committee of the budget and several other permanent committees not concerned with subjects of legislation. In 1918, however, also in accordance with French developments a full set of permanent committees to deal with legislative measures was organized, largely on the principle of one for each ministry. In the Congress they were elected by the sections and in the Senate by the whole house.

Except for the requirement that bills regarding taxation and public credit be first presented to the Congress, the powers of the two chambers to legislate and to represent the nation before the monarchy were equal. The Congress was empowered to bring criminal prosecutions against ministers before the Senate acting as a court; only in this case could one chamber, the Senate, be convoked without the other. Political control over the ministry rested on extraconstitutional conventions; but no effective control or supervision was maintained, for two great prodynasty parties of very similar composition held the reins of government by turn on the basis of majorities obtained fraudulently through the Ministry of the Interior. The consequent inability of the lower middle class, the urban proletariat and other groups to obtain adequate representation and the antipolitical views of strongly organized syndicalist workmen together with the internal disintegration of the controlling parties and the

reactionary character of the Senate led to the political indifference of the great mass of the nation, including the intellectual minority, and to the loss of prestige of the Cortes. All these circumstances, reenforced by the absolutist tendencies of the crown and the gross interference of the army in civil affairs after it had assumed a position of independence with respect to parliament quite similar to that of the military forces in Japan, facilitated the establishment of the dictatorship of General Primo de Rivera in 1923. It is to be noted that one of the objects of the latter was the suppression of the campaign tenaciously maintained by the socialist and republican minorities in parliament to fix responsibility for the military disaster in Morocco in 1921.

Upon the downfall of the monarchy in April, 1931, the provisional government summoned a Constituent Cortes; this body elaborated a republican constitution, which was promulgated in December, 1931. The Cortes was dominated by republicans and socialists and contained but few members of previous parliaments. It was elected by universal, direct suffrage from multiple member constituencies provincial in scope, replacing what had been for the most part a system of small single member districts. The great cities elected their own representatives independently in proportion to their population. The attributes and powers vested in the Cortes by the new constitution are based upon national experience as well as upon post-war developments abroad. Unicameralism has been adopted. Members are elected for four years; women and the clergy, the latter having hitherto been barred from the lower house, are now eligible.

Out of the failure of the constitution of 1876 to provide for its own revision or to determine clearly in what political organs the ultimate power lay arose the question, which was prominent immediately before the fall of the monarchy, whether the amending power belonged to the simple legislative process or to a constituent cortes with or without the king. The new constitution provides for the proposal of amendments by the Cortes and the election of a constituent cortes, which shall decide on them and which shall subsequently be transformed into an ordinary legislative assembly. The legislative power of the Cortes is further affected by the incorporation of international agreements into constitutional law, by the powers which the Cortes is authorized to grant to autonomous regions and by the rights, with some restrictions,

of initiative and referendum. In certain matters, notably the amendment of the budget and votes of confidence, the Cortes may take action only by absolute or larger majorities, while on the latter question procedure is regulated in order to provide sufficient time for thoughtful deliberation. On the other hand, parliamentary control in certain respects is very pronounced. A permanent *diputación* will act as a check on the executive; the Court of Audit (*Tribunal de Cuentas de la República*) depends directly upon the Cortes. The latter may bring criminal prosecutions against the president and the ministers before a special court of constitutional guarantees; and automatic expedients familiar elsewhere have been adopted in order to place before the voters conflicts between parliament and the president, in whose election the Cortes participates.

Under the old regime the ineffectiveness of the parliamentary system and a growing recognition of the significance of education led to the establishment of several more or less autonomous organizations authorized to investigate, prepare legislation and carry out the administration within their fields. The new constitution, displaying a similar respect for expert opinion and assistance in the drafting of legislation, contemplates the establishment of advisory bodies for both executive and legislative branches; the preparation of legislation is declared a highly important function of the ministry, and the president of the Supreme Court and the attorney general are ex officio members of the parliamentary Committee on Justice. The Declaration of Geneva (*Declaration des droits de l'enfant*, 1924) is accepted as normative. By empowering the Cortes to delegate to the ministry the function of elaborating the details of a good deal of the legislation which it may enact the authors of the constitution contemplate that the legislative action of parliament will be largely of a comparatively general, policy determining character.

The home rule aspirations of certain regions—Catalonia, the Basque Provinces and Galicia—presage the early establishment of regional assemblies, whose nature and functions cannot yet be ascertained.

Portugal. From mediaeval times until quite recently the history of the popular assembly in Portugal has coincided in the main with its history in the rest of the peninsula. The Cortes did not meet at all in the eighteenth century. A Constituent Cortes established the modern regime with the constitution of 1822, which like

its model, the Spanish constitution of 1812, was idealistic in character and incompatible with the milieu; its career was ephemeral. In 1826 King Pedro IV proclaimed a constitution establishing a moderately liberal parliamentary government on the British pattern. The legislative power was vested in a lower house elected by indirect, limited suffrage and an upper house, or Senate, similar in form to that ultimately adopted in Spain. Against this system were ranged the absolutists led by the infante Miguel, who summoned a Cortes after the ancient manner and had himself proclaimed absolute monarch. After a long period of bitter strife the constitution prevailed and remained in force with occasional liberalizations until the royal dictatorship, which was the culmination of the corrupt rotation in office of the prodynasty parties, brought about the fall of the monarchy. The republican constitution of 1911 entrusted the legislative power to a lower and an upper house, both elected by direct manhood suffrage. Besides the purely legislative function the Cortes possessed certain other powers, especially with respect to administrative and judicial organization. It elected the president of the republic, who had no veto power and whom it could remove; although the constitution did not expressly provide that ministers were responsible to the legislature, they were in fact under its control. Initiation of discussion on many matters was the prerogative of the lower house. Although the colonies were represented in both houses, the upper house was empowered to approve or to reject the nomination of important officials for the oversea possessions. To settle conflicts between the two houses joint sessions were provided. The republican parliament, however, was unable to cope with the problems before it, and a long series of revolts culminated in the establishment in 1926 of a military dictatorship which suspended the constitution.

JOSÉ ORS Y CAPDEQUI

JAPAN. Although the origins of the Japanese parliament, or Diet, go back to the overthrow of the Tokugawa shogunate in 1867, it was not until 1889, when the emperor granted the people a constitution, that the national legislative assembly was established in its present form.

The conservative forces of the empire offered strong resistance to any advanced steps toward democracy, and the framers of the new constitution made progress only with great difficulty. From this conflict there resulted a series of com-

promises which seriously cripple the power of the Diet by reserving certain important prerogatives to the emperor. The emperor, with the Privy Council as advisory body, was given control over general matters of diplomacy, such as the declaration of war and peace and the conclusion of treaties; he was vested with supreme command of the army and navy, including the determination of their organization and peace-time standing as well as the power to make laws in times of urgent necessity without consulting the Diet. Furthermore the Diet's power over the budget was curtailed by a regulation providing that if the Diet failed to pass a budget that of the previous year was to be considered in force. Two additional factors further curtail the power of the Diet: the shortness of its sessions—it meets for only three months in the year—and the strong bureaucracy built up by Japan's strict civil service laws. The greatest weakness of the Diet lies in its almost complete lack of control over the military branches of the government, around which cling all the surviving forces of the old order and over which its only effective control is the power of studying and passing the budget; its investigation into the activities of the army and navy during the course of debate over the budget tends somewhat to exercise a restraining influence upon them.

In theory the cabinet is responsible to the emperor alone. In the days following the granting of the constitution the leaders of the government were recruited from among the elder statesmen of the Satsuma and Choshu clans, who ruled regardless of the Diet, which functioned chiefly as a forum for criticism. When the first parties were formed the Diet began to use what power it had, principally its right of passing the budget. Party attacks on cabinets headed by the elder statesmen increased in strength until in 1898 the ministers, unable to secure a complaisant Diet, suddenly called on the party leaders to form a government. Party and non-party governments then alternated until 1925, when the last non-party government resigned. Since that date, although the theory of responsibility to the emperor has not been changed, in actual practise the cabinet has been held responsible to the Diet; and particularly since the passing of the universal manhood suffrage law in 1925 the life of a cabinet depends chiefly on the support which it can summon from the majority of the members of the lower House.

In the governmental scheme the Diet occupies a peculiar position without exact counter-

part in any other country. Sovereignty in Japan is vested legally in the emperor, not in the people. The Diet is therefore not the lawmaking body, as this function is reserved to the emperor, although "with the consent of the imperial Diet." Any law passed by the Diet must be promulgated by the emperor before it comes into effect. No emperor has ever failed to sanction a law so passed, but this is less because of imperial subservience to the public will than because the preferred position given to government bills before the Diet makes it difficult, almost impossible, for any measure not sponsored by the government to be passed.

The two houses of the Japanese Diet possess the same organization. Contrary to the western custom they do not regulate their own interior organization, which is provided for in a law promulgated by the emperor. Nor do they select their own president and vice presidents; these officers are appointed by the emperor, who must, however, in the case of the House of Representatives, choose from three candidates elected by the House.

The two houses are organized on the committee system. In addition to the Committee of the Whole into which each House can resolve itself there are standing committees on the budget, accounts, petitions, discipline and the like and special committees instituted as the need arises; all committees are elected by the houses.

The members of the Diet possess the constitutional immunities common to countries with a parliamentary form of government. They are not held responsible outside the chamber for their voice or vote within it, and they cannot be arrested during the sessions except in certain special instances.

Laws introduced into the Diet undergo three readings: the first in special committee, the second in the Committee of the Whole (with general debate and the offering of amendments), the third for the final vote. Debate is free and subject to little restriction; the vote is public. While sessions of the Diet are generally open they can be made secret either by vote of the houses or at the request of the government.

In addition to its power over legislation and finance the Diet has other means for supervising the executive. Each House may present addresses directly to the emperor. This power, used to impeach the cabinet when that body was not responsible to the Diet, now has little significance; nor is there much more in the power of each House to make representations to

the government on any subject, since these refer only to future policy and are not binding. Both houses may also pass resolutions, including those of "no confidence." Since these usually lead to the resignation of the government, this power is exercised primarily by the lower House. The Diet may make inquiries into affairs of state; but as it has no power to compel the appearance of witnesses, this prerogative is not as important as it is, for instance, in the United States. Lastly, members of the Diet may question or interpellate the government on all matters within its responsibility. This power plays an important part in Japanese legislation.

The powers of the two houses of the Diet are theoretically equal, but the House of Peers is in some respects in a stronger position, chiefly because it is not subject to dissolution. The prestige of the lower House has, however, increased so greatly in recent years as to more than offset this advantage of position and make it actually the dominant chamber. Until some ten years ago the personnel of the upper House was of generally superior quality, but with the shift of the power of government to the House of Representatives the latter has attracted some strong figures. Because, however, of the corruption which still characterizes elections the average quality of the members has not improved markedly.

With the spread of education, which has reduced illiteracy to less than 6 percent of the whole population, the corresponding rise of the power of the press, the political emancipation of all the male population of the country and the betterment of the economic condition of the common people due to the rapid industrial revolution the prestige of the Diet has risen steadily. But the strength of the political parties and in consequence the effectiveness of the Diet have been weakened by the abnormally large amounts of money which the parties spend for election and which compel them to seek alliance with the capitalist element of the country, thus leading to much corruption. This factor has made the steady progress of democracy difficult and has tended to diminish the efficiency of party government in Japan.

C., *Modern Japan and Its Problems* (New York 1928).

LEGITIMATION. See ILLEGITIMACY.

LE GRAND, DANIEL (1783-1859), Swiss-French social reformer. Le Grand was one of the earliest advocates of international labor legislation. The friendship of his father, a silk ribbon manufacturer, with Pestalozzi and Oberlin early called his attention to the degenerating influences brought about by the industrial revolution

on the working class. As early as 1832 he advocated Sunday rest as well as the income tax; a few years later he advocated child labor legislation, the prohibition of night work for women, shorter working hours for all workers and state subsidies for crèches. The Prussian legislation of 1839, based upon the British legislation of 1833, embodied his proposals. This inspired Le Grand to issue appeals to the governments of Europe in the hope of creating a system of continental labor legislation in order to overcome the competition of low standard nations—a program also implicit in Adolphe Blanqui's proposals. His appeals stressed the physical crippling of the working population, its moral decline and the destruction of family life by unlimited overtime as well as the resultant overproduction and crises; he proposed international legislation providing for a twelve-hour day for factory workers, prohibition of night work, limitation of overtime and a six-day working week, with the understanding moreover that higher standards of national legislation were not to be endangered. His appeals influenced both the British and Prussian governments but were met with evasive proposals by the government of Napoleon III. Le Grand's writings were rediscovered in 1875 by Thiersch, who reprinted them in his book, *Über den christlichen Staat* (Basel 1875). His ideas were incorporated in all subsequent efforts to forward labor legislation, and their influence was acknowledged at the Washington Labor Conference in 1919.

LEHFELDT, ROBERT ALFRED (1868-1927), South African economist. Lehfeldt was born in Birmingham and studied at Cambridge and London universities. He was for a number of years professor of physics at East London College and at the South African School of Mines and Technology (now the University of the Witwatersrand) in Johannesburg. In the course of time he developed a keen interest in economic problems and in 1916 accepted the new chair of economics at the University of the Witwatersrand.

Lehfeldt brought to the study of economics a profound knowledge of mathematics and a remarkable aptitude for quantitative treatment of economic problems. He attracted international

attention by his plan of currency stabilization through the control of the supply of gold rather than of the demand for it. It called for the establishment of an international commission which would purchase all important gold mines and regulate the value of gold by restricting output in times of rising prices and increasing it in times of falling prices. He was the first to estimate the union's national income and he offered valuable testimony before a number of government commissions in South Africa, particularly before the Kemmerer and Vissering Commission on the resumption of gold payments by the Union of South Africa. Lehfeldt was one of South Africa's outstanding economists and exercised considerable influence in stimulating quantitative economic research in the union.

S. HERBERT FRANKEL

Important works: *Gold, Prices and the Witwatersrand* (London 1919); *Restoration of the World's Currencies* (London 1923); *The National Resources of South Africa* (Johannesburg 1922); Union of South Africa, Finance Department, *Report . . . on the Resumption of Gold Payments* (Pretoria 1925) p. 439-64; "Public Loans and the Modern Theory of Interest" in *Economic Journal*, vol. xxii (1912) 16-33; "The Rate of Interest on British and Foreign Investments" in *Royal Statistical Society, Journal*, vol. lxxvi (1912-13) 196-207, 415-16, and vol. lxxvii (1913-14) 432-35.

LEHR, JULIUS (1845-94), German economist. Lehr completed his studies in forestry at the University of Giessen and became *Privatdozent* at the Forstliche Hochschule at Münden. From 1874 he was professor of economics at the Technische Hochschule in Karlsruhe and from 1885 professor of forest policy and forest history at the University of Munich. Even during his early training in the field of forestry Lehr was particularly interested in its economic aspects.

In economics Lehr's most important works are: *Grundbegriffe und Grundlagen der Volkswirtschaft* (Leipsic 1893; published as pt. i, vol. i in Frankenstein's *Hand- und Lehrbuch der Staatswissenschaften*) and *Politische Ökonomie in gedrängter Fassung* (Munich 1892; 4th ed. by C. Neuburg, 1905). Minor publications dealt with currency and tariff problems. Lehr was one of the few followers of the Austrian school in Germany and attempted to apply the mathematical method to the marginal analysis of price and wage problems but with little success. He was, however, more effective in the application of the mathematical method to forestry economics. His essay "Forstpolitik" in T. Lorey's *Handbuch der Forstwissenschaft* (2 vols., Tübingen 1887-88; 3rd ed., 4 vols., 1912-13, vol. iv,

p. 91-287) was the first comprehensive work on the subject and stimulated later writers in this field. He defended the viewpoint that the utilization of forests be left to private enterprise, although he urged compulsory reforestation of those woodlands which are definitely suitable only for growth of timber. A student of Gustav Heyer, he advocated the cultivation of forestry statics (a discipline dealing with the ascertainment of the value of the forest produce), to which he made significant contributions. Besides numerous articles in the *Allgemeine Forst- und Jagdzeitung*, of which he was coeditor, he wrote the masterly treatise "Waldwertrechnung und Statistik" for Lorey's *Handbuch*, published separately as *Beiträge zur Statistik der Preise, insbesondere des Geldes und des Holzes* (Frankfort 1885), in which he made important contributions also to the methodology of index numbers.

MAX ENDRES

Consult: Weber, R., in *Zeitschrift für Forst- und Jagdwesen*, vol. xxvi (1894) 728-31.

LEIB, JOHANN GEORGE (1670-1727), German cameralist. Leib, who was trained as a jurist, was in 1710 appointed royal Polish and electoral Saxon councilor and *Referendar* and in 1716 councilor of commerce. He was a typical representative of the German cameralists, who adopted and cultivated the doctrines of the Austrian cameralists. His cameralistic approach was evident in his treatise *Von Verbesserung Land und Leuten, und wie ein Regent seine Macht und Ansehen erheben könne, zerfällt in 4 Proben* (Frankfort 1708), in which he claimed that to increase his own well being, power and prestige a sovereign must be concerned primarily with the welfare of his subjects. A typical mercantilist, he stated as a basic rule that money must remain in the country. The country should be populated not merely by many but by useful men. The subjects not only should support themselves through their industry but should also draw money into the country. For the stimulation of production he recommended the creation of an "academy of manufacturing," and for the support of trade the founding of trading companies and a note and deposit bank (*Giro- und Lehnbank*). He considered the excise the most just tax and warned against every deterioration of the coinage. Although national considerations were at the basis of his economic views, he was not unfamiliar with international economic problems. He pointed out the advantages of oversea trade and recommended for its

encouragement the establishment of an Asiatic and African trading company. He considered that a favorable balance of trade, however, was absolutely necessary for the prosperity of the state. Like the Austrian cameralists, Leib attacked French attempts to achieve political and economic supremacy.

LEIBNIZ, FREIHERR VON, GOTTFRIED WILHELM (1646-1716), German philosopher, scientist and statesman. Leibniz was the last European thinker to master the whole of knowledge. His intellectual activity extended to philosophy, mathematics, natural science, theology, history, politics, jurisprudence and philology, and in addition he was a practical statesman engaged in prodigious plans for furthering the peace of Europe and the interests of the German empire.

The significance of Leibniz' philosophy for the intellectual history of Europe in the seventeenth and eighteenth centuries consists in the fact that he gave the clearest and keenest systematic expression to the fundamental problem of the relationship between world and individual, between macrocosm and microcosm, and endeavored to solve it by new intellectual methods. According to Leibniz individual and universe are not antitheses nor do they bear to each other the relation of a single part to a purely quantitative whole consisting of a number of parts. Individual and universe are rather related qualitatively; the universe can be conceived only in the form of individuality and individuality can be determined and defined in its essence only in its relationship with the universe. This concept forms the starting point of Leibniz' theory of monads and his system of monadology. In this system every individual "I," every monad, implies the totality of the world—not in the sense of actually comprising it but in the sense of ideally representing it. Thus there results in contrast with Spinoza's monism a strongly pluralistic view of the world. Each individual being represents the universe of phenomena; but

each apprehends it from a different point of view and thus gives to the representation a particular distinctness and a unique stamp. These particular eternally differentiated "perspectives" of the universe are, however, bound to one another by a common fundamental law which governs them all.

Along with the principle of the monad goes as its necessary complement and fulfilment the principle of preestablished harmony. It states that from monad to monad no direct interaction, no *influxus physicus*, takes place, but that it is in the fundamental nature of every individual being to develop purely from its own principles a definite set of perceptions, which stands in the closest connection with the perceptive sets of other subjects. All these sets thus form one single set, in that in all of them, however much they may differ from one another, the same order is expressed, the same amenability of the universe to law. The metaphysical foundation for this unity is found according to Leibniz in the unity of their source; for since they all issue from the highest monad, God, His Being is expressed in every one of them, although in varying degrees of distinctness and, as it were, in varying outline.

The ethical and social doctrines of Leibniz are based on the concept of natural law. Natural law provides for him stable and changeless standards of morals, which possess the character of eternal truths and are capable of a firm a priori deduction. First and foremost among the basic moral standards is the freedom of the individual and his right to intellectual and moral improvement. These basic privileges must in no way be encroached upon or limited by positive regulations. In the development of these ideas Leibniz followed theological models, especially the Augustinian concept of the *Civitas Dei*, but his fundamental tendency is directed to secularizing this concept; i.e. releasing it from all specific supernatural ideas and basing it purely on the *lumen naturale*, on unmistakably evident rational examination. All "rational souls" are entitled to equal privileges, for each belongs to the great "republic of spirits" at whose head stands God. For the building up of the state and of society there follows therefore the postulate that in them too the individual must never be considered as a mere part which under certain circumstances must be sacrificed to the whole. Rather each individual subject as a free personality within the unity of the state and of society preserves his own privileges. No mere authoritative decree, no mere positive legal ordinance,

must encroach upon this natural right; for above the positive law, the *jus strictum*, stands the higher moral law, the law of equity, *jus aequitatis*. On similar grounds Leibniz attacked the institution of slavery, maintaining that the right of possession could apply only to things not to persons. With these principles Leibniz helped to create the philosophical foundation of the doctrine of the "inalienable rights of man" and to prepare the ground for the development which this doctrine was to receive in the period of the Enlightenment.

In the field of practical politics Leibniz planned far reaching schemes which were primarily designed to protect the equilibrium of Europe and the independence of the German empire against the advance of France. Leibniz sought to meet the danger of Louis XIV's plans of conquest by proposals for the reform of the German imperial administration, which sought to achieve a more closely knit coordination of the forces of the empire, and by a policy of union against France. Leibniz also outlined a plan for an expedition to Egypt, which he placed before Louis XIV with a view to diverting him through a campaign against the Turks from his plans of European conquest. In the field of ecclesiastical policy his chief aspiration was the reestablishment of ecclesiastical unity in the Christian world. His negotiations with the leading representatives of Catholicism, especially with Bossuet, were wrecked by the stand taken by the latter, who demanded as a condition of ecclesiastical unity the unreserved approbation by the Protestants of the decisions of the Council of Trent. Leibniz then endeavored to bring about the union of the Lutheran and Reformed churches. Here too his plans were never realized.

Along with questions of domestic and ecclesiastical politics Leibniz occupied himself unceasingly and tirelessly with that of the organization of science and learning. The later organized Berlin Akademie der Wissenschaften was founded essentially after his plans; it developed out of the Societät der Wissenschaften of Berlin, which Leibniz headed in 1700. Leibniz also outlined extensive plans for the founding of learned societies in Dresden, St. Petersburg and Vienna.

In all his many sided practical activity the general trend of Leibniz' basic theoretical ideas, the concepts of the monad and preestablished harmony, is unmistakable. The true concept of unity is not opposed to that of multiplicity; rather it implies multiplicity and seeks to be its intellectual expression. Even his attempts at the

organization of science and his pedagogical interests express a principle derived from his theoretical system. Although all individuals, or monads, are necessarily different, this difference cannot lie in the perceptual content of each monad—since every subject, according to his special view, represents the whole of the world—but is to be found in the method of representation, in the varying degrees of clearness and distinctness with which the universe is represented in the various subjects. The higher monads are differentiated from the lower by the fact that they are capable of a higher degree of clarity and distinctness in their ideas. Hence the aim of intellectual and moral progress is to seek an ever clearer view of the entire physical and moral world and an ever sharper differentiation of the principles underlying them.

With such ideas, which unmistakably spring from the primary premises of his doctrine, Leibniz set up a theoretical and moral program which had a decided effect on posterity and with which he became the true originator and founder of the philosophy of the Enlightenment.

ERNST CASSIRER

Works: The most complete edition of Leibniz' works in regard to history and political science is that edited by Onno Klopp, 11 vols. (Hanover 1864-84). The Preussische Akademie der Wissenschaften is now preparing a new complete edition in 40 volumes (of which five have already appeared, Darmstadt 1923-31), which will be particularly valuable for Leibniz' correspondence. The most important philosophical works of Leibniz have been translated into English by R. Latta in *The Monadology and Other Philosophical Writings* (Oxford 1898).

LEIST, BURKARD WILHELM (1819-1906), German jurist. Leist was successively professor at Basel, Rostock and Jena, where he died after a long illness. Because of his marked personal peculiarities it is difficult to associate him with any school. He began his career with strictly Romanistic studies and his *Die bonorum possessio, ihre geschichtliche Entwicklung und heutige Geltung* (2 vols., Göttingen 1844-48) still belongs in method to the old historical school. In addition to history Leist began to pursue systematic analytical researches, which he published as *Civilistische Studien auf dem Gebiete dogmatischer Analyse* (4 vols., Jena 1854-77). An even more important work of this character was his continuation of Glück's celebrated commentary on the Pandects, *Ausführliche Erläuterung der Pandecten*. In his treatment of the Roman law Leist set himself against its wholesale reception and demanded the abandonment of such of its institutions as had no practical value in modern life. In the 1880's, however, he began definitely to follow a bent which set him apart from the Romanists of his time. In the *Civilistische Studien* he had refined upon the dogma of the historical school by distinguishing two kinds of legal norms. Some were *naturalis ratio*, or given by the conditions of life, needing only the sanction of custom or legislation to become positive law, but others were *civilis ratio*, or the products of particular needs. Leist even attempted to associate this distinction with that which the Romans made between *jus gentium* and *jus civile*. To illustrate his juristic theories he followed a direction opposite to that of the Roman mediaevalists. He went back to the Aryan sources of the Roman law, and the result was a series of three great works, *Graeco-italische Rechtsgeschichte* (Jena 1884), *Alt-arisches jus gentium* (Jena 1889) and *Alt-arisches jus civile* (2 vols., Jena 1892-96), in which he brought Latin law into close relation with Indian and Greek law.

(Munich 1880-1910) vol. iii, pt. ii, p. 835-42.

LEISURE. Philosophy and the common judgment of mankind are at one in holding leisure among the chief goods of life. Although in common parlance and in general practise leisure, the opportunity for disinterested activity, tends to become confused with amusement or recreation, one means of its utilization, yet in the high evaluation generally placed on leisure there lies a confused recognition of what in philosophy becomes more explicit. "Wisdom cometh by opportunity of leisure," said the ancient prophet. For Aristotle there were three kindred ideas expressing the end of human life: theoretical wisdom, happiness and leisure. Leisure was more than the condition for the attainment of the other two; it represented the satisfaction of the truly disinterested interest, the achievement of understanding, which is man's highest goal.

For purposes of social analysis the concept is usually narrowed—and widened—to mean simply freedom from activities centering around the making of a livelihood. It is indeed a rather bitter paradox that leisure has come to have a connotation of loose relaxation and that the term leisure class carries an accent of opprobrium. Earlier periods would have been far more ready than the present to see even in certain pursuits which result in the gaining of a livelihood exercises in leisure. The artist, the scientist, the scholar, work at their art or science or research for their living; in another sense theirs is the privilege of constant leisure to devote themselves to what are for them the highest pursuits. The methods by which the artist and scholar were supported in older societies emphasized the latter aspect of their position, as the commercial payment for their services emphasizes the former aspect. One might say that the more nearly ideal the organization of society, the more perfectly would every individual's work be adapted to his abilities and the greater would be the number of people who enjoyed similar qualitative leisure through rather than outside of their work.

The very concept of leisure as contrasted with work is largely foreign to primitive societies. To every member of the community falls his share of labor and of play, his opportunity for participation in the important rites and mysteries. The orientation of life is physiologically as well as socially toward long periods of leisurely work interspersed with occasional periods of intense expenditure of energy. The separation of a priestly class marks the first step toward the development of groups privileged through the

possession of leisure. The fact that the priest's activities are regarded by the community as in the highest degree necessary to its survival in no way negates this interpretation. The social implications of the development become clearer when the priestly class multiplies beyond a point consistent with its spiritual functions and engages in governmental and scholarly pursuits. Concurrently or somewhat later the emergence of a distinct warrior class and the recognition of a difference between the pursuits of men and those of women lay the basis for the growth of other leisure classes.

The full meaning of leisure is perhaps never apparent until one portion of society is deprived of all possibility of its enjoyment. Throughout antiquity slavery and slavery alone made possible to the higher classes emancipation from the necessity for constant attention to material needs. This indeed was its justification to the Greeks. Some such justification underlies all willing and thoughtful acceptance of a leisure class. The reverence and the privilege accorded the Chinese scholar are also the result of a conviction of his social indispensability. Something of the force of the concept of leisure as it developed in antiquity is indicated by the fact that the English word school is derived from the Greek word for leisure (*scholē*). The philosophers were not unaware of the problem of the unprivileged, but their only solution was further insistence on freedom of the citizen from manual labor and labor for pay.

Even the artist and the sculptor were not regarded by Aristotle or Plato as leisured men, since the nature of their crafts tied them down to constant repetition of one kind of action and thus robbed them of the freeman's ability to choose his interests. The rigor of this conception has less appeal to the modern social philosopher; but it is grounded in a distinction which he too must recognize. Leisure is time at the disposal of the complete man; the man exhausted by fourteen hours of labor or eight hours under a speed up system and harassed by insecurity possesses no leisure but only time for recreation that will enable him to return again to toil.

The leisured members of society have been most often those with assured incomes not dependent on their personal efforts—landed proprietors, rentiers, holders of sinecures. Probably in every age there have been individuals who secured leisure by boldly claiming it as a necessity of existence and stripping themselves of all other requirements except those which can be

supplied by a minimum of "making-a-living" activity. Certain occupations, more frequent in pre-industrial societies than today, in themselves afford considerable leisure. The shepherd and the small proprietor in rich country, if they have little opportunity for variety in the use of leisure, have long hours of freedom, out of which have come through the centuries folk songs, folklore and dancing. The craftsman of some skill who could travel about from country to country, as in the early period of the *compagnonnage*, had many of the perquisites of leisure. Under some conditions, although decreasingly in the modern world, the sailor has had leisure. The soldier of fortune often possessed it, but the leisure of the modern military man is of a different and spurious character. It should be remembered too that throughout antiquity and the Middle Ages the normal number of holidays during the year was about 115. Except in periods of unusual economic stress even slaves enjoyed such holidays, although their means of utilization of such time were limited. But the grouping of work around numerous holidays probably resulted in more effective leisure than the one day of rest out of seven in industrial society.

Throughout history where definite leisure classes have come into existence they have been based upon wealth—whether in the form of slaves, land, securities or the rights and goods of a corporate body, such as the church. In general such classes have been the inheritors of wealth, not in any dynamic sense its makers. In periods of rapid economic change the makers of fortunes have time for nothing but fortune making and luxury spending. A leisure class may fulfil certain productive or entrepreneurial functions, as did most of the English squires and many of the Roman landed proprietors living in the smaller villas scattered throughout Italy. A landed aristocracy which has not become too affected by absenteeism ordinarily combines leisure with such productive activity. On the other hand, a class endowed with the privilege of leisure may develop for itself a great number of time consuming ritualistic functions, such as those of a military caste or of the followers of a royal court or of the society woman of the contemporary middle and upper classes, which preclude the enjoyment of any real leisure. A leisure class is not essentially a wealth worshipping or a spendthrift class. Where the possession of wealth is so taken for granted that it loses all value as a sign of personal repute, other criteria come to the fore, among them those of individual

worth and cultural fitness. But a leisure class may also take over the standards of other groups, and not infrequently throughout history leisure classes have been caught up in a whirl of luxury spending: the despots of Asia, with their fabulous riches; the landed aristocracy of Egypt, with its nominal military duties and its days of hunting and nights of feasting; the luxurious urbanites of imperial Rome; the privileged of Renaissance Italy and the court of Louis XIV. If the display consisted in many cases of artistic appreciation and civilized enjoyments, it was nevertheless on a lavish scale and in contrast to a complete lack of opportunity for the masses.

Whatever complaints might be made against the luxury of the rich, however, the desirability of leisure itself was never really brought into question throughout antiquity or the Middle Ages. With the growth of capitalism there appeared a new and condemnatory attitude. The Puritan emphasis on the moral duty of continuous industry reflected the needs of a mercantilistic and later of an industrial economy. The further disparagements of arts and amusements represented the reaction of the vigorous rising bourgeois class to the luxury and display of the older aristocracy. The "economic man" appeared in the theory of political economy. The high point was reached with Carlyle's glorification of work. The economic and moral bases of the doctrine are contained in Carlyle's bitter observation that a man with an income of £200,000 a year consumes the whole fruit of 6666 men's labor and does nothing for it but "kill partridges." Ruskin and his followers went even farther and demanded that every individual spend some time each day in manual labor. This Puritan doctrine of work with its emphasis on the seriousness of life as a business took firmer hold in the United States than in Europe, where century old traditions could not so easily be displaced. The doctrine was most effectively expressed for the United States by Benjamin Franklin in his *Advice to Young Tradesmen* and *Necessary Hints to Those That Would Be Rich*. Perhaps the effort of clearing a continent for settlement required some such emphasis on material things; but the gospel persisted past the period of its usefulness, intertwined with philosophies of activism, doctrines of progress and interest in the psychology of success.

It is one of the most striking commentaries on modern civilization that the machine, which offers the possibility of a measure of leisure for all, as slavery made possible leisure for a few,

has thus far brought only unemployment on an increasing scale, idleness for many women of the middle class and, on the other hand, extended opportunities for education and leisure to the adolescents of the community. This failure of economic organization is perhaps partly to be traced to contemporary attitudes toward work and leisure. Certainly what the normal work span of the future is to be depends partly upon technological achievement, but it depends quite as much upon the balancing of choice between increased productivity and increased leisure. The reality of such choice is most obvious in a planned economy. The problem in Russia is still largely theoretical; the existing emphasis in that country on the provision of music, drama and art represents the influence of cultural traditions which regard such things as among the necessities even in war time; but if the Soviet system does not break down, the choice between shorter hours and increased productivity will sooner or later come up in acute form. Less visibly but quite as surely all of modern society is faced with a similar choice.

Certain changes of attitude are already apparent. When the eight-hour laws were under discussion in 1916 and 1917, the prospect of such accretions of free time led governments and social reformers to talk fearfully of the leisure "problem." Temperance societies prepared for increased drunkenness and attention was centered on the real evils of commercialized recreation as it prevailed in most large cities. Concurrently with the passage of the limitation of hours legislation a number of the European governments set up official commissions to study the problem of workers' leisure activities. In 1924 the International Labor Office devoted part of its sixth conference to a discussion of the problem; in 1930 the First International Congress on Workers' Spare Time met at Liège with 300 members from eighteen countries, the governments of fourteen of which were officially represented. In the discussions of this congress and previously in those of the International Labor Office the emphasis had completely shifted from repression of commercial recreation to provision of facilities for other ways of utilizing leisure, and the conception of leisure as a problem had given way to its recognition as an opportunity and a cultural necessity.

The gains involved in the eight-hour laws were largely lost through speeding up systems and through tacit abrogation of the legislation in a period of crisis. The achievement of real

leisure for all is still a dream of the future. Nevertheless, the direction of recreational activities even under present conditions is of importance not only as indicating attitudes but because of the indirect influence on production. Without attempting to solve the problem of adequate housing for workers, the groups in Europe interested in workers' leisure increasingly insist that proper housing and city planning are essential prerequisites to socially or individually valuable utilization of leisure. Excessive urbanization and bad transportation facilities deprive the worker of much of his nominal free time; lack of space in his home throws him upon the streets and into commercialized amusements. The official leisure committees of the various European countries have encouraged and aided financially the allotment movement with its attempt to secure for every worker a small plot of ground on the outskirts of the city; they have aided the development of play fields and stadia and helped support the numerous athletic societies which have increased so rapidly since the war. They have either supported or set up choral and theatrical societies and organizations to promote folk dancing and public festivals. The great increase in free libraries since the World War has been largely due to their efforts and they have strengthened and supplemented the already existing adult education institutions. In addition the various trade union groups, the cooperative organizations and the socialist parties not only occupy a great deal of the leisure time of their members but themselves organize gymnastic societies, workers' classes and art exhibits, theatrical groups and similar projects.

In the United States the recreation movement is limited largely to adolescents, trade unionism is weak and, with a few notable exceptions, adult education is non-existent. The limited traditions of community living and the greater emphasis on the achievement of wealth as a goal have retarded the development of the idea of creative enjoyment of leisure. Nevertheless, here as well as in Europe the automobile, the moving picture and the radio have provided the means for new forms of recreation which taste and economic change might transform into the basis of real leisure.

The tone of any society is largely determined by the quality of its leisure, whether that leisure be restricted to a few or spread widely. The definite leisure classes have played varying social parts, some purely wasteful, some creative. It

may be questioned whether until very recent times the economic basis for art existed except in class inequalities. In the field of government a privileged leisure class may still have a function. The advantages of a group trained to an interest in public affairs, not in partisan affairs, cannot be lightly dismissed. The success of England in governing an empire and in making democracy work with a degree of satisfactoriness not achieved in any other country is in no small part due to the fact that it inherited from an earlier system a leisured class imbued with traditions of a statesmanship which, if it was conservative, was at least not corrupt.

If the leisure classes no longer need be the carriers and supporters of artists and scientists, they retain their more fundamental function of the carriers of tradition. Leisure is not only the germinating time of art and philosophy, the time in which the seer attains glimpses of the values and the realities behind ordinary appearance; it is also the opportunity for appreciation, the time in which such values get across into common experience. The quality of a civilization depends upon the effectiveness of the transmission of such values. The widespread enjoyment of leisure is thus a matter of greatest moment, culturally as well as economically. Modern mechanisms open up new possibilities of communication; it remains to be seen what traditions and standards will be spread.

LELEWEL, JOACHIM (1786-1861), Polish historian. Lelewel, who was of German ancestry, was born in Warsaw and studied at the University of Vilna, where he was appointed lecturer in history in 1815. Three years later he became librarian and lecturer in history at the University of Warsaw; he returned to Vilna as professor of history in 1821. In 1824 he was dismissed from his post by the Russian authorities for participation in student political activities. In 1828 he was elected to the Polish Diet in Warsaw and for a time was in charge of the educational system of the Kingdom of Poland. During the insurrection of 1831 he was a member of the Polish national government but with the collapse of the insurrection he fled to France, where he assumed the leadership of the democratic elements of the Polish emigration. Banished from that country in 1833, he settled in Belgium, where he resumed his scholarly work without, however, discontinuing his activities on behalf of Polish freedom. All his life he pleaded the cause of international solidarity, social justice and equality of rights for the Jews. He maintained close relations with Lafayette, Mazzini and Engels and is said to have been one of the signatories to the *Communist Manifesto*.

Lelewel is the outstanding nineteenth century Polish historian. He brought to his subject a critical mind, an exceptional capacity for work and an expert knowledge of geography, bibliography, numismatics and other auxiliary disciplines, fields in which he himself had made pioneering contributions. He conceived of history as the all embracing study of the development of mankind and in his studies aimed at discovering the chain of causes which binds together the succession of historical events. In explaining historical phenomena he studied the psychology of the individual and of the group as well as the physical and sociological milieu of the nation. Although he was a rationalist in his

understanding of the past, like Herder and the romantic historical school he centered his studies around the development of the nation as a distinct political and cultural entity existing since earliest times. He saw the only basis for historical judgment and the sole guide for shaping future policies in national values as crystallized in the collective experience of the people. A great patriot and ardent democrat, he found in the early Polish institutions the elements of democracy, freedom and social justice which he deemed essential to a happy national life in the future.

(rev. ed. Warsaw 1922-23).

LEMIRE, ABBÉ JULES (1853-1928), French priest, politician and social reformer. Lemire's later preoccupation with the problem of drawing the clergy into the movement for social reform was foreshadowed in his *Le Cardinal Manning et son action sociale* (Paris 1893). The same year he was elected deputy from Hazebrouck, a department of his native French Flanders, and retained his seat in the Chamber uninterruptedly until his death. He soon evinced an attachment to the

republic and to democracy, which resulted in his making more friends on the left than on the right. He made an effort to develop a party organization for the Christian Democrats, who were led by Léon Harmel. In order to stimulate social activity among the lower clergy Lemire with the support of several archbishops organized two congresses of priests, the first at Reims in 1896 and the second at Bourges in 1900. During the same period he created a society known as the *Ligue du Coin de Terre et du Foyer* for the promotion of one of his favorite projects, state provision of a small plot of land for every family. Through his efforts and those of the league this idea was realized by the law on the *bien de famille* passed in 1909 and modeled on the American Homestead Act. Little advantage, however, was taken of the privilege. Lemire therefore turned his attention to the creation of workmen's gardens to be organized on the outskirts of towns through private or municipal societies. Between 1903 and 1923 he directed the convocation of six national congresses to deal with this question. During the first decade of his membership in the Chamber, while Leo XIII was pope, Lemire had enjoyed the esteem and his bold innovations the support of the papacy. But he made enemies among the royalist and conservative Catholics, who were especially powerful in the diocese of Cambrai, to which he belonged as priest. Under Pius X they had their revenge. Although he failed in his attempts to prevent Lemire's candidacy for deputy in 1910 and again in 1914, the archbishop of Cambrai was able to inflict a canonical penalty upon him. The penalty was lifted during the World War.

LEMONNIER, CHARLES and ÉLISA, French reformers. After giving up a chair in philosophy because of a conflict over his social theories Charles Lemonnier (1806-91) led in developing the pacifist ideas of the Saint-Simonian school of socialism. Arguing that universal organization for peace depended on organizing Europe along the lines of the United States of America and the Swiss Confederation he proposed to group all republican states under a superior government with power to administer

common finances and a federal army. The constituent states were to be disarmed. In 1867 he helped found the still existing *Ligue Internationale de la Paix et de la Liberté*, of which such men as Hugo, Quinet, Garibaldi and Mill became members. He also helped found and edit its organ, *Les États-Unis d'Europe*, which has appeared intermittently since 1868 and is now in its fifteenth series. In 1873 he drafted an arbitration treaty, probably the first legal formulation of ideas theretofore expounded only in moral and political form.

Among Lemonnier's works is a biography of his wife, Élisabeth Lemonnier (1805-65), who in 1848 under the influence of her husband's Saint-Simonian ideas opened a workshop for mothers of families impoverished as a result of the February revolution. Observing their incompetence and awkwardness she resolved to undertake the moral and vocational education of girls. In 1856 she founded a *Société de Protection Maternelle pour les Jeunes Filles*, which in 1862 became the *Société pour l'Enseignement Professionnel des Femmes*. The success of the two non-sectarian Écoles Élisabeth Lemonnier founded by these organizations was spectacular. Similar schools were organized in Switzerland, Belgium and Italy. Élisabeth Lemonnier's pedagogical formula, a division of the courses into two main groups—general instruction including French language and arithmetic and special instruction including commercial courses, bookkeeping, elements of law and foreign languages—became the basis of a French educational statute of 1880, since applied successfully by the city of Paris.

(Paris 1843); *Élisabeth Lemonnier* (Saint-Germain 1866); "Essai sur les oeuvres et la doctrine de Saint-Simon" in Saint-Simon, C. H., *Oeuvres choisies*, 3 vols. (Brussels 1859) vol. i, p. v-cv.

LENIN, NIKOLAI I. *See* ULYANOV, VLADIMIR ILYICH.

LEO III (The Isaurian) (c. 680-741), ruler of the Eastern Empire. Leo is scarcely known outside the writings of his enemies. An Asiatic born at Germanicia (Mar 'ash), probably in a heretic environment hostile to the worship of icons, he emigrated to Thrace. Justinian II favored him and Anastasius II made him general of Anatolia. Leo refused to recognize the usurper Theodosius and was proclaimed emperor by his army; he

entered Constantinople March 25, 717. His successful defense of the city against the Saracens in 717-18 was the first rebuff to the Arabs in the east and has the same historic importance as the battle of Poitiers in the west.

After putting down military revolts, checking conspiracies and transporting Anatolian populations to Europe he proclaimed a new legal code, the *Ecloga* (published in 740 and drawn up in its present form in the ninth century), which is in principle an abstract of the Justinian code but completed and amended on many points. It raised the status of women, ameliorated tribunals and tempered the laws against heretics. Leo's agricultural law protected free peasants against encroachments of large estates. Other edicts attacked Jews and Montanists. In 726 Leo proscribed image worship, and his order to demolish the statue of Christ surmounting the gate of the sacred palace aroused a bloody disturbance. Greece and Italy refused to pay taxes, and Pope Gregory II protested. Leo retaliated by confiscating the papal patrimones, depriving the pope of jurisdiction over southern Italy and Illyricum and doubling the tribute. John of Damascus, a Jerusalem monk, attacked Leo in three discourses and Gregory II proclaimed the legitimacy of image worship. On his death Leo left the empire in good external condition but with civil war imminent.

Freshfield (Cambridge, Eng. 1927).

LEO XIII (1810-1903), pope from 1878. Leo XIII, born Gioacchino Pecci, received his education at the Jesuit school of Viterbo and the Collegio Romano and at the Accademia dei

Nobili in Rome. From 1843 to 1846 he was papal nuncio to Brussels and from 1846 to 1878 archbishop of Perugia. In 1853 he was named cardinal by Pius IX and in 1878 he was elected pope.

The great historical importance of Leo XIII rests on his formulation of the Catholic attitude toward modern social and political problems and his influence on the development of the social Catholic movements. His views on these questions are found in his encyclicals *Quod apostolici muneris* (1878, tr. as *Socialism, Communism, Nihilism*); *Arcanum divinae* (1880, tr. as *Christian Marriage*); *Libertas praestantissimum* (1888, tr. as *Human Liberty*); *Sapientiae christianae* (1890, tr. as *The Chief Duties of Christians as Citizens*); *Au milieu des sollicitudes* (1892, tr. as *Allegiance to the Republic*); *Graves de communi* (1901, tr. as *Christian Democracy*); and more especially in *Immortale Dei* (1885, tr. as *Christian Constitution of States*) and *Rerum novarum* (1891, tr. as *On the Condition of the Working Classes*). Leo derived his inspiration for these doctrines chiefly from a profound study of the writings of Thomas Aquinas. He emphasized the importance of Aquinas in his encyclical *Aeterni patris* (1879, tr. as *The Study of Scholastic Philosophy*) and in this way contributed greatly to the development of the neo-Thomist movement. In his political philosophy he adhered to the organismic view of the state, considering the state necessary for human welfare and declaring its ordinances to have a moral and binding force. The state is supreme and independent in its own province, which is "the civil and political order." Its end, however, should be the promotion of the general welfare, which includes concern for the material well being of the population as well as mere civil and political rights. The form of government of a state is the result of purely human and historic conditions, hence any form is legitimate provided it insures this general welfare. Very significant too was Leo's urging of all Catholics to take an active part in political affairs in order to aid in the realization of these principles.

Leo's social doctrines had a powerful effect in giving official sanction to the emerging social Catholic movements and in spurring them on to further development. His *Rerum novarum*, which was issued in response to the need for authoritative guidance in the application of Catholic principles to industrial relations, was the most comprehensive statement in that field until it was reaffirmed, reapplied and supplemented by the encyclical of Pius XI *Quadragesimo anno*

(1931, tr. as *On Reconstructing the Social Order*). The church, Leo maintained, has a right to pass judgment upon economic actions and relations, inasmuch as they are subject to the moral law. Private ownership even of capital is sanctioned by natural law and is necessary for human welfare, but it should be widely and more equitably distributed so that "the gulf between vast wealth and sheer poverty will be bridged over." A free contract is not always a just contract in the matter of wages, for the worker has a moral right to compensation which will at least be sufficient for a decent livelihood; laborers have a natural right to enter into and maintain unions which will enable "each individual member to better his condition to the utmost in body, mind and property"; and the state is obliged to intervene for the protection of the working classes as well as for "the general interest" whenever adequate protection cannot be otherwise provided.

LEO, HEINRICH (1799-1878), German historian and publicist. In politics Leo always stood between the older clerical conservatism of his friend Ludwig von Gerlach, whose intrinsic culture, however, he lacked, and the newer militaristic conservatism, although he was unaware of the needs of a diplomacy conscious of its political responsibility. While a student and member of the *Burschenschaft* he was a radical democrat but was pushed to the right by the revolutions of 1830 and 1848 and became a typical reactionary. The son of a clergyman, he now discovered his own orthodoxy, which as the intellectual form of antirevolutionism assumed a correspondingly militant cast. He also discovered that he was still really rooted in the old tradition and, in opposition to the capitalistic groups of "manufacturers and Jews" growing up with the economic revolution, felt impelled as the repre-

sentative of the intellectual upper class of the middle bourgeoisie to defend the landowning estates, the military caste and the clergy, which were also threatened by plutocratic development. He became an advocate of the old order based on estates and an opponent of the emerging society based on class divisions, thus following the pattern typical of the first stage of industrialism, in which conservative opinion opposing the new order sympathizes with the oppressed proletariat. He regarded the liberal ideology of freedom as merely a disguise for the economic drive toward supremacy; in the idea of pacifistic humanitarianism he saw only a leveling sentimentality under cloak of which gross materialism and intellectualistic rationalism could flourish. To these tendencies Leo opposed his ideal of the old order of estates, resting on simplicity, strength and good breeding, organized patriarchally and imbued with the attitude toward life of the "God fearing hired soldier," for whom war signifies "life" in its proper or dramatic sense. Leo's writing of history is both antihumanitarian and antihumanistic, a genuine example of bourgeois learning become reactionary. It detests all periods beloved by liberal culture—classical antiquity as well as the period from the Reformation and the Enlightenment to the French Revolution—and extols the Middle Ages, the Restoration and finally the era of Bismarck with its triumph of national militarism. Thus Leo held a concept of history which reconciled the conservative point of view of the old order of estates with that of the new Prussian nationalism.

LEONHARD, RUDOLF KARL GEORG (1851-1921), German jurist. Leonhard was successively professor at Göttingen, Halle, Marburg and Breslau. He was important in connection with the problems of interpretation arising from the new German civil code which went into effect in 1900. Imbued with the spirit of Jhering, whose colleague he had been for four years at Göttingen, he had already shown his awareness of modern needs in his treatment of the Pandects. In his *Der allgemeine Teil des bürgerlichen Gesetzbuchs* (Berlin 1900) he now sought on the one hand to orient the general part of the code in its historical background and on the other to give effect to the purposes of its creation. The abstract character of the general part made this an especially difficult task. An early work of Leonhard's, *Der Irrtum bei nichtigen Verträgen nach römischem Recht* (2 vols., Berlin 1882-83), achieved a new and fundamental importance in a revised edition under the title *Der Irrtum als Ursache nichtiger Verträge* (published in the *Studien zur Erläuterung des bürgerlichen Rechts*, vols. xxii-xxiii, Breslau 1907), a series which Leonhard edited after 1900. In this work Leonhard attacked one of the leading problems of interpretation under the code, the problem of the making of a valid contract. He came to the conclusion that the code provisions relating to the effect of mistake upon a declaratory act did not control the general problem of consent. He counseled the abandonment of the theory of declaration, because its correct elements follow directly from a true interpretation of the theory of intent. Leonhard achieved an international reputation. In 1907-08 he lectured at Columbia University and in 1912 published a German translation of Holmes' *The Common Law*. As an internationally minded jurist he always fought against the tendency to exaggerate nationalistic attitudes in the law.

ALFRED MANIGK

LEONTOVICH, FEDOR IVANOVICH (1833-1910), historian of Russian law. Leontovich occupied the chair of history of Russian law at the University of Odessa and later at the University of Warsaw. His researches were mainly concerned with the legal institutions of the Kiev period in early Russian history and with the history of those provinces of southern and western Russia which during the fourteenth, fifteenth

and sixteenth centuries came into the fold of the Lithuanian principality. His investigation of early Russian history led him to the conclusion, shared by later Russian historians, that the basic political and social life of the Russian peoples of the early period revolved around communes resembling those which flourished among the Balkan Slavs under the name of *zadrugi*. He denied emphatically the existence of a national consciousness which would in this early period have provided a basis for the political union of the various branches of the Russian Slavs; this view, however, remained unaccepted in Russian historical literature. In the course of researches devoted to the evolution of Lithuanian Russian law Leontovich reconstructed the history of those early Russian countries which were incorporated in the Lithuanian principality after the Tartar invasion; he established the common origin of their social structure and emphasized the changes brought about by Polish influence in Lithuania. Although his theories were attacked by many later historians, his works have not lost their importance, chiefly because of the wealth of data collected.

V. MIAKOTIN

Important works: *Krestyane ugo-zapadnoy Rossii po litovskomu pravu XV i XVI vekov* (The peasants of southwestern Russia under the Lithuanian law in the fifteenth and sixteenth centuries) (Kiev 1863); "Russkaya Pravda i Litovskiy Statut" (Russian law and the Lithuanian Statute) in *Kievskiya universitetskaya izvestiya*, nos. 2-4 (1865); *Istoriya russkogo prava* (The history of Russian law) (Odessa 1869); *Ochevki istorii litovsko-russkogo prava* (Outline of the history of Lithuanian Russian law) (St. Petersburg 1894); "Natsionalny vopros v drevney Rossii" (The national problem in early Russia) in *Varshavskiya universitetskaya izvestiya*, no. 9 (1894), and no. 1 (1895).

LEONTYEV, KONSTANTIN NIKOLAYEVICH (1831-91), Russian philosopher and journalist. Leontyev began life as a physician, taking part in the Crimean War and later going into private practise. During this period he wrote several novels, which developed the theme of free love made popular at the time by George Sand. In 1863 he entered the consular service in the Near East but resigned in 1871 to embrace religion as a monk. To these years belong a number of novels and short stories offering a realistic and skilfully drawn picture of the life of the Christian population under Turkish rule. Having failed of admission to the monastery on Mount Athos, he reentered the foreign service for two short periods, acted as assistant editor of the government newspaper *Varshavsky dnevnik*

(Warsaw chronicle) and worked as censor in Moscow before retiring to a monastery in Russia in 1887. In the last decade of his life he earned a certain notoriety as the apologist of extreme reaction and an advocate of "the voluptuous cult of corporal punishment."

Leontyev's originality as a religious and political thinker was recognized only after his death. He regarded fear as the beginning of all wisdom and love as only its fruit; therefore, not unlike Nietzsche, he contemptuously dismissed ethics and called for the assertion of force. He saw no warrant in the Gospels for the belief that mundane existence will ever cease to be dominated by evil and emphasized the ascetic elements of Christianity and the hierarchic aspects of church organization. He found the meaning of history in the development of a small élite for mystical purposes. In the course of their historical evolution peoples pass from the stage of youthful simplicity to that of fully developed complexity, when society is divided into fixed classes and life is stable and aesthetically satisfying; such complex societies must be ruled by force—an authoritarian clerical hierarchy and an autocratic centralized monarchy. The last stage of national existence, which he identified with the ugliness and philistinism of an egalitarian-democratic civilization, is that of artificial simplicity resulting from decay. He believed that Russia might be saved from this fate and acquire a historical mission if its natural evolution were arrested and the Byzantine elements of Russian culture—autocracy and the Greek church—as well as the indigenous village community were preserved and strengthened. Leontyev believed in Byzantinism rather than Slavophilism or Panslavism. He desired the annexation of Constantinople by Russia to provide the basis for an integral cultural development and looked askance upon the nationalist democratic aspirations of the southern Slavs.

LEOPOLD II (1835-1909), Belgian king. Leopold, who came to the throne in 1865, is important chiefly for his leadership in opening up Africa to European imperialism after Stanley's explorations. In 1885 an international association headed by Leopold and largely financed by Belgian capital was formed at the Congress of Berlin to settle the Congo. It claimed to be actuated by humanitarian ideals, but its imperialistic drive was soon obvious. The independent Congo state fell increasingly under Belgian domination and in 1907 Leopold annexed it. Leopold's Congo policy, a clear breach of the Berlin contract, was a classic demonstration of the aims and methods of modern imperialism, which regards a colony as an opportunity for exploitation. Native labor was made compulsory, native social and political organization was deliberately smashed and the natives were converted into impersonal tools of production. As the governor general said in 1906, the state was to be left "face to face with a population freed of all social liens and without any attachment to the soil." Leopold, holding that these were no deplorable concessions to circumstances but necessary steps in imperialist policy, struggled against the reform campaign led by E. D. Morel. His policy brought him a large fortune as long as raw wealth lay ready for the taking. But when elementary industrialization became necessary, exploitation and subjugation by concessionaire companies, troops and black mercenaries proved an inefficient system of production. Leopold, having no further suggestions to offer, continued, however, to advocate the old policy. He made no enduring contribution to the theory of colonization.

LE PLAY, PIERRE GUILLAUME FRÉDÉRIC (1806-82), French social reformer. From 1829 to 1853 during his travels as an engineer Le Play studied the technical progress, the eco-

conomic prosperity and the status of labor in all European countries. In 1848 he gave up his professorship of metallurgy in the École des Mines and henceforth devoted himself chiefly to propounding his theory of social reform. His first important work, *Ouvriers européens* (Paris 1855; 2nd ed., 6 vols., Tours 1877-79), was a collection of monographs on the material and moral life of thirty-six families. After the appearance of this book he founded the Société d'Économie Sociale for the propagation of his ideas. At the suggestion of Napoleon III he published an extract from *Ouvriers européens* under the title *Réforme sociale en France* (2 vols., Paris 1864; 7th ed., 3 vols., 1887) containing observations on religion, property, family, association, private enterprise and government, which won for him great success in government and academic circles. This was followed by *L'organisation de la famille* (Paris 1871, 3rd ed. Tours 1884); *La constitution de l'Angleterre* (2 vols., Tours 1875), in which English education and legislation were portrayed as ideal; *Réformes en Europe et le salut en France* (Tours 1876); and finally in 1881 as a synthesis of his ideas the *Constitution essentielle de l'humanité* (Tours 1881, 2nd ed. 1893). He founded local and autonomous groups for the propagation of his views and won many adherents, among whom were A. J. Focillon, Charles de Ribbe, Claudio Jannet and Demolins. The review *Réforme sociale* was established in 1881 to carry on his work.

Le Play was a pioneer in establishing the methodology of the social survey and in studying family budgets for the purpose of determining standards of living; his work in this field has had international influence. In opposition to the parties and doctrines which sprang from the French Revolution he set forth the principles of Christian morality, duty and obedience to authority as the bases of a sound economic and social organization. He maintained that wherever traditional Christian morals had remained in force social tranquillity and economic well being reigned; he found confirmation for this idea not only in Russia and England but in the history of his own small native province of Normandy. He regarded private property, as opposed to purely ideal common ownership, as the foundation of the modern state and therefore advocated a free law of inheritance, as opposed to the restriction which since the covenant of 1793 prescribed in France equal division of property among the children. This law designed to protect democratic institutions against the nobility had led to

parceling of land, a development which he believed imperiled the family as well as economy. He held the patriarchal family, which he wished to restore, to be the basis of morality and social organization, especially among the lower classes, and denounced birth control. He opposed governmental regulation to solve labor problems arising from the effects of the industrial revolution and the collapse of the guilds and advocated instead the cooperation of employers and workers for the purposes of safeguarding the religion, property and family of the working population. The emancipation of the oppressed he held to be the task of the upper classes, who owed their workmen more than mere wages. He contended that the superiority of the English administration rested on self-government, esprit de corps and family spirit, while in France the omnipotent bureaucracy destroyed local and provincial independence. Democracy to him was natural for the community; aristocracy—representation by people of rank—for the province; and monarchy with the support of parliament for the entire state.

LEPSIUS, KARL RICHARD (1810-84), German Egyptologist. Lepsius studied archaeology with Otfried Müller and philology with Bopp and Böckh, receiving his doctor's degree in 1833, a year after the death of Champollion. He had already attracted the attention of his university teachers when he was invited by C. K. J. Bunsen, the first director of the newly founded German archaeological institute in Rome, to undertake studies in the Italic dialects and more especially in the monuments of the newly deciphered Egyptian. In France there were at that time no successors of Champollion fully equal to the task of carrying on the noble tradition he had established. In Italy Salvolini and Rosellini were

of decidedly inferior capacities, and in Germany the science of Egyptology had not even begun. It fell to the lot of Lepsius therefore not only to found the new science of Egyptology in Germany but also very largely to secure for Egyptology full recognition as a science and to save it from the hands of the dilettante. By 1838 he had made himself master of the then available body of knowledge which formed the earliest stage of the youthful science. His first Egyptological publication was a letter written in 1837 to Rosellini on the hieroglyphic alphabet, and his first more substantial work was a folio published in 1842 containing a selection of the chief hieroglyphic monuments of Egypt for the use of students. This was quickly followed by the first modern edition (Leipzig 1842) of the *Egyptian Book of the Dead*, based upon an unfortunately late papyrus, which Lepsius found in the collections at Turin.

From the beginning Lepsius' keen and enthusiastic mind had discerned the necessity for fundamental work in the new science in Egypt itself. At the instigation of Bunsen and Alexander von Humboldt, Frederick William IV of Prussia dispatched Lepsius to Egypt on a scientific mission among the monuments of the Nile. Lepsius' conception of what he ought to accomplish on this journey had grown steadily, until his plans had passed far beyond the mere mission of a single handed scholar and provided for a well manned expedition, in personnel and experience without question the most efficient group which up to that time had ever worked in the Orient. It included architects, draftsmen, painters and even plaster molders to make casts of the original monuments. Lepsius began his work in Egypt in September, 1842, and finished in October, 1845; its results were published in his *Denkmäler aus Aegypten und Aethiopien* (12 vols., Berlin 1849-59). These volumes revolutionized the situation of Egyptological science and for the first time placed in the hands of scholars a body of original sources reflecting the entire civilized development on the Nile for a period of over three thousand years—from about 3000 B.C. down into the Christian era. For the first time the Old Kingdom (about 2980-2475 B.C.), mirrored in its records, which Lepsius had found especially in the great cemeteries of Gizeh and Sakkara, was revealed to the modern world. Of the Middle Kingdom (c. 2160-1788 B.C.) likewise the sources presented by these folios were for the first time adequately representative. The work of Lepsius thus added

a new and earlier period of human development to modern knowledge; that is, an earlier thousand years of human history than had been known before. On the other hand, the classic tradition inherited from Greek historians that Ethiopia had been the oldest source of civilization on the Nile was completely and finally demolished by his discoveries.

Lepsius was primarily an archaeologist, venturing only sparingly and very cautiously into the field of philological research. He translated very few Egyptian monuments and has left almost no such translations among his works. Nevertheless, his work included a wide range of investigations: from his *Die Chronologie der Aegypter* (Berlin 1849) and his epoch making *Königsbuch der alten Ägypter* (2 vols., Berlin 1858) to his phonetic studies in the East undertaken to produce an alphabet for universal use in transliterations, his masterly study and classification of the African languages covering the whole continent and his last scientific production, a grammar of the Nubian languages.

Shortly after his return from his great expedition the first chair in the new science in Germany was established at Berlin. In August, 1846, Lepsius was appointed the first professor of Egyptology in a German university, and four years later he was elected a member of the Königliche Akademie der Wissenschaften in Berlin. In 1855 in a new building planned by himself he installed the famous Egyptian Museum at Berlin, of which he became the first director. Thus by his own brilliant achievements and through his three influential positions Lepsius gave to Berlin its commanding position in Egyptological science, a leadership which two generations of his successors there have worthily maintained.

JAMES HENRY BREASTED

Consult: Dillmann, C. F., "Gedächtnissrede auf Karl Richard Lepsius" in Königliche Akademie der Wissenschaften, Berlin, *Abhandlungen*, 1885 (Berlin 1886) p. 1-25; Ebers, Georg, *Richard Lepsius* (Leipzig 1885), tr. by Zoe Dana Underhill (New York 1887), with bibliography of Lepsius' works p. 325-47.

LEROUX, PIERRE (1797-1871), French social philosopher. Very much influenced by Condorcet and by the religious currents of his time, Leroux was one of the most important disciples of Saint-Simon. With Dubois he founded the *Globe*, which became the organ of the Saint-Simonians after 1830. After this he founded the *Revue encyclopédique*; later with J. Reynaud he established the *Encyclopédie nouvelle* and with

George Sand the *Revue indépendante*, two other Saint-Simonian publications which constitute one of the fruitful sources of French socialist ideology.

He was a vigorous critic of modern society, in which "the millionaires and the capitalists are the nobles of our time"; of the democratic political regime, subjected to the "despotism of the majorities"; of the wage system, which allotted to the workers less than half of the revenue produced by their labor; of the Catholic religion; of the family; of property. A feminist and "revolutionary pacifist," he sought to reconcile labor with property, religion with philosophy. It was upon the republican motto, Liberty, equality, fraternity, that he based his system, which may be defined as a progressive and religious democracy. "We gravitate toward God," he wrote.

Leroux saw that man is a social product; he may thus be considered with Bonald and Saint-Simon as one of the precursors of modern sociology. Far from wishing to absorb man into society, however, he sought to individualize him—all men are equal, but they are also jointly responsible. He demanded "a complete society in which the individual may be free." In his appeal "Aux politiques" (in *Situation actuelle de la société*, Boussac 1847) he wrote that the role of society "is to give to all its members, to each according to his needs, his capacity and his works, the enjoyment of the product of the common labor, whether such labor be an idea, a work of art or material property."

All men, he held, must work and fulfil a function; hence they should be called functionaries. They will elect an assembly which will be divided into three subgroups—judicial, legislative and executive—which will appoint the national administration.

Leroux claimed and is generally accorded the honor of having been the first to use the term socialist about 1833; actually the term is already to be found in an Owenite publication of the year 1827. Leroux was, however, the first to analyze the concept (in an article "De l'individualisme et du socialisme" in *Revue encyclopédique* for 1834). He is also to be credited with having given the word solidarity, previously current only in legal usage, its present ethical meaning.

MAXIME LEROY

l'égalité (Boussac 1838, new ed. 1848); *La grève de Samarez* (Paris 1863); *Job* (Paris 1866).

Consult: Pioger, Julien, *Pierre Leroux socialiste* (Paris 1896); Raillard, Célestin, *Pierre Leroux et ses œuvres* (Châteauroux 1899); Thomas, P. Félix, *Pierre Leroux, sa vie, son œuvre, sa doctrine* (Paris 1904); Mirecourt, Eugène de, *Pierre Leroux* (Paris 1856); Janet, Paul, "La philosophie de Pierre Leroux" in *Revue des deux mondes*, vol. clii (1899) 767-88, and vol. cliii (1899) 379-406; Fidaio-Justiniani, J.-E., *Pierre Leroux* (Paris 1912).

LEROY-BEAULIEU, PAUL (1843-1916), French economist. After studying law in Paris Leroy-Beaulieu traveled in England and then went to Bonn and Berlin for further study. He made his début as a writer in 1867 with the prize essay on *L'état moral et intellectuel des classes ouvrières et de son influence sur le taux des salaires* (Paris 1868) and at the age of twenty-seven won four prizes offered by the Institut. From 1869 he collaborated on the *Revue des deux mondes* and in 1871 became an editor of the *Journal des débats*. When Boutmy formed the École Libre des Sciences Politiques in 1872 Leroy-Beaulieu accepted the chair of public finance. In 1873 he founded *Économiste français* and became its editor, missing only one weekly article until his death. In 1880 he succeeded Chevalier as professor of political economy at the Collège de France.

Leroy-Beaulieu was one of the outstanding representatives of economic liberalism in France. His views, formulated in a number of works and elaborated in the *Traité théorique et pratique d'économie politique* (4 vols., Paris 1895; 5th ed., 5 vols., 1910), followed essentially the principles of classical economics. He rejected, however, the pessimistic conclusions of the latter and in the *Essai sur la répartition des richesses* (Paris 1881, 4th ed. 1897) argued that the Ricardian law of rent had no present application and that the subsistence theory of wages and its derivative, the iron law of wages, existed only in the imagination of their authors. In his value theory he followed the marginal analysis of the Austrians. His chief work, the *Traité de la science des finances* (2 vols., Paris 1877; 8th ed. 1912), was for a long time the leading treatise on fiscal science. The popularity of the first volume, dealing with public revenues, was subsequently impaired by the failure to emphasize the social aspects; the second volume, devoted to public credit, retains its importance to the present day. Although he was an outspoken opponent of state intervention Leroy-Beaulieu pleaded in his works on colonization and on population prob-

lems for positive state action in promoting colonial expansion and in encouraging a higher birth rate by offering financial rewards to large families. Among his many other works the more important deal with the labor question, the modern state and collectivism.

Leroy-Beaulieu played a prominent part in the economic life of France; an owner of large tracts of land at home and in the colonies and a successful farmer, he took a keen interest in agriculture and frequently acted in an advisory and executive capacity for many industrial and financial organizations. His lack of sympathy with the social currents of the day prevented him from succeeding in several attempts to enter the parliament. Leroy-Beaulieu will live as an economic journalist without peer and as an economist of remarkable brilliance and clarity rather than of depth.

LESE MAJESTY. The crime of lese majesty has followed a practically uniform evolution in the law of all nations. In Roman law, where its course of development was initiated, the term *crimen majestatis populi romani immutatae* was first used principally to denote an offense against the fundamental laws of the plebs. Later the term covered in general any infringement upon the dignity of the Roman people. The sources do not permit a precise definition of the content of this political crime in Roman law; it is easier to point negatively to what Mommsen called its "juridic boundlessness." With the downfall of the Roman Republic this boundlessness became very evident, for the person of the emperor tended to become the object of the *crimen laesae majestatis*. The offense, which formerly had involved a violation of the basic rights of the plebs, grew into a crime against the absolute ruler (see Institutes, 4, 18, 3, *Lex Julia Majestatis, quae in eos, qui contra imperatorem vel rem publicam aliquid moliti sunt, suum vigorem extendit*).

The peculiarities of lese majesty, traces of which are still evident in German law and in the

law of other countries, arose during this period of development. A characteristic feature of the Germanic law is that in the criminal punishment of offenses against the commonwealth emphasis is laid upon the idea that the citizen or subject who endangers the commonwealth's safety violates the loyalty he owes to his people and to his sovereign: the political criminal is a traitor and the crime against the state is in its nature treason. The terms *Hochverrat* and *Landesverrat* in German law and high treason or treason in Anglo-American law still express this concept. A more precise delimitation of the various criminal aspects in the *crimen laesae majestatis* of Roman law and the exact definition of lese majesty in modern law evolved very slowly, and it may be said that this evolution is still far from complete. The treatment of the material in the legislation and jurisprudence of other countries has not gone much further than in those of Germany and has in fact remained behind the latter in many respects.

The juridic aspects of the crime of lese majesty can be elucidated through an examination of the German law. The crime, which was abolished by the German constitution of 1919, was formerly covered by paragraphs 94 to 97, "Libeling the Sovereign," and paragraphs 98 to 101, "Libeling Ruling Princes of Confederate States" in the German penal code of 1871. The distinction between libeling the sovereign ruler and libeling one of the princes of the confederate states was made because of the structure of the German Empire of 1871, according to which the empire had the kaiser at its head and the several states retained their own sovereignty under kings or ruling princes.

In Roman law lese majesty came under the head of high treason, whereas the German penal code (*Strafgesetzbuch*) differentiated between the two, with the intention of providing a milder penalty for less serious attacks upon the ruler's person. Aside from these considerations of juridic policy the dogmatic system of the German penal code drew a sharp line between the two offenses. Considered systematically high treason (*Strafgesetzbuch*, para. 80-87) was an attack upon the inner stability of the nation; such an attack existed when the criminal enterprise aimed to kill the sovereign or to hinder him in the exercise of his right to govern by limiting his freedom of person, by impairing his health or by any other manner of injury. Lese majesty, on the other hand, was any other attack upon the state's sovereignty which did not produce a

change in the existing constitutional situation but which was directed against the person of the sovereign without directly affecting the state.

In this limited sense the concept of lese majesty comprises bodily injury as well as any libel of the sovereign or of a ruling prince of one of the federated states. The problem of the relationship of a libel of the sovereign to ordinary libel as covered by paragraph 185 of the German penal code was of importance in the systematic organization of German law. The problem was whether lese majesty was a *delictum sui generis* or an aggravated libel within the meaning of paragraph 185. A priori two types of libel of a sovereign are conceivable: libel of the ruling prince as a sovereign and libel attacking the honor of the prince as a private individual. This distinction is based upon the concept that the object of the libel is the honor of the individual; whether or not an utterance is a libel and what sort of libel it involves depend upon the identity of the person to whom the expression is directed and in what juridic capacity the injured party is affected. In the case of the sovereign in addition to his own person the dignity or reverence due him as the representative of the state may be a special target for disrespectful utterances. Whoever injures this dignity, which is by no means identical with the personal honor of the sovereign, even though one and the same utterance may injure both, injures the dignity of the state. Since lese majesty as a *delictum sui generis* can be directed against the dignity of the ruler only as the exponent of state power, the crime is possible properly only against the sovereign; whereas aggravated libel, which is aimed at the person, may be committed against members of the ruling house as well as the ruler himself.

The German criminal law did not protect the dignity of the sovereign as the representative of the state. In accordance with the principle *nulla poena sine lege* laid down in paragraph 2 of the penal code attacks against the respect due the sovereign could be punished only if they came under the provisions of high treason or if they libeled him as a private individual. There was no lese majesty in the true sense of a *delictum sui generis*; libel of the sovereign was a libel in the ordinary sense, aggravated and punished by special penalties solely because of the eminence of the injured party. In practise of course this general jurisprudential point of view was not always maintained, and because of the actual need for protecting the sovereign judicial opinions often punished injuries to his dignity as

injuries to the representative of the state, by extending the interpretation of the provisions of the penal code.

Other offenses covered by the law under the heading "Libel of the Sovereign or of a Ruling Prince of One of the Confederate States" were "acts of violence" directed against the kaiser, sovereign rulers or ruling princes of confederated states as well as against members of a ruling house (*Strafgesetzbuch*, para. 94-101). Acts of violence in the sense of this section of the code included all deliberate attacks directed upon the life, freedom or honor of another, in so far as the attack consisted of actions aimed against the body. Lese majesty thus comprised murder and attempted murder of the kaiser or the ruler of one of the confederated states as well as plots to imprison a ruler or to deliver him over to the enemy (*Strafgesetzbuch*, para. 80 and 81, no. 1), all of which also come under the offense of high treason. Premeditation in the case of lese majesty was identical with that in simple libel, but the offender in the former had also to know that his libelous attack was aimed against a person protected by the special provisions. The memory of deceased sovereigns enjoyed no special protection; offenses against it were covered by paragraph 189 of the penal code.

The severity of the penalty for lese majesty was graduated according to the intensity of the constitutional bond between the party injured and the offender. It varied from life imprisonment at hard labor for acts of violence against the kaiser, the offender's own sovereign or the sovereign of the German state in which he resided to imprisonment or confinement in a fortress for one week or more as the minimum penalty for libeling a member of the ruling house of another German state.

With the abolition of the constitution of 1871 through the revolution of 1918 the paragraphs of the penal code concerning lese majesty have become null and void. Since the establishment of a republic and of the republican form of government in the various states the *Reichspräsident* has taken the place of the kaiser, while in the several states the monarch's duties have been taken over by the state governments. Protection of officials representing the state is laid down in the Law for the Protection of the Republic (1930). Paragraph 3 of this law makes provision for the imprisonment of anyone attacking or conspiring to attack the life or body of the *Reichspräsident* or of a member of the Reich or state cabinets. Paragraph 5 provides a fine and

imprisonment for anyone publicly slandering the constitutional form of government by insulting or slandering the officials named in paragraph 3 as well as for anyone calumniating or slandering a deceased *Reichspresident* or, a deceased member of a cabinet with respect to his public office. Thus the governmental officials as the representatives of the state are afforded special protection in contrast to the lese majesty provisions of the old code. With these new provisions the development of the law concerning offenses against the sovereign turns back in a certain sense to its point of departure, the Roman law. The libel of the president of a republic, however, is not to be regarded as lese majesty in the sense of the modern monarchical concept of the law. The 1927 draft of a German criminal code which is not yet in effect provides in paragraph 101 a corresponding section on public calumny of the republican form of government or of constitutional public bodies.

In other countries the law of lese majesty, likewise based on Roman law, arrived at provisions similar to those of the German law. No essential differences are found between the provisions in Great Britain, Holland and the Scandinavian countries; everywhere lese majesty is a crime. In English law, according to Stephen, "Every one commits a misdemeanor who is guilty of any contempt against the person of His Majesty, or his royal dignity, by means of any contumelious, insulting, or disparaging words, acts, or gestures" (*A Digest of the Criminal Law*, art. 83). But although lese majesty is a crime in England, British legal practise in principle opposes prosecution for it, just as it in general opposes prosecution for political activities. Moreover the monarchy is so firmly rooted in England that direct or indirect attacks upon that institution or upon the monarch himself are rare, and when they do occur public disapproval proves a sufficient punishment.

In systems of jurisprudence based upon an enlightened and firm patriotism penalties for lese majesty in the monarchical state and for similar crimes in republics cannot be dispensed with. The loyalty to the commonwealth so deeply impressed upon the consciousness of all citizens, however, leads to a general disapproval of offenders which becomes a greater and more impressive penalty than any possible sentence.

LESLIE, THOMAS EDWARD CLIFFE (1827-82), Irish economist. Leslie graduated from Trinity College, Dublin, in 1847 and studied law in London under Sir Henry Maine. In 1853 he became professor of political economy and jurisprudence in Belfast.

Leslie's attitude toward economics was largely determined by his studies in jurisprudence and by the works of Comte. From Maine he had learned the importance of the historical approach in the social sciences, from Comte their essential unity and interdependence. He thus found himself more in sympathy with the extremists of the German historical school than with the followers of Ricardo. Adam Smith, he held, had derived his generalizations from historical research, thus making economics a con-

crete inductive study. In the hands of Ricardo and his school, however, it had become deductive and abstract. It was based upon two main premises, the desire for wealth and the prevalence of free competition. But the desire for wealth was "an abstraction compounding a great variety of heterogeneous motives," and economists were neglecting their chief function if they failed to analyze these motives and to show their expressions at different times and under different social conditions. Secondly, the assumption of free competition, involving the tendency to equality of wages and of profits, was grossly untrue to facts; and yet upon it depended not merely the cost of production theory of value and the postulate of a "wages fund" but also certain common beliefs about taxation. In particular, it was currently argued that taxes upon commodities must fall upon the consumers and that indirect taxes could not hurt the working classes, since a rise in the cost of living must be compensated by an equivalent rise in wages. Leslie had no difficulty in showing the error of applying these theories without qualification to the circumstances of contemporary life and advocated the abolition of all forms of indirect taxation. His general thesis regarding the uselessness of deductive reasoning in economics was rejected by such critics as Sidgwick and J. N. Keynes, who pointed out that it could not be proved merely by emphasizing the value of historical research or by appealing to the as yet rudimentary science of sociology.

Leslie himself conducted some valuable investigations into the land systems of Europe and into past and contemporary price movements. But he did not live to complete any major work theoretical or historical and his reputation really rests on his methodological essays.

LESSING, GOTTHOLD EPHRAIM (1729-81), German dramatist, critic and philosopher. Lessing was born in Saxony and after theological and classical studies in Leipsic and Wittenberg lived as a journalist in Berlin and Leipsic. In 1760 he became secretary to General von Tauentzien in Breslau, in 1767 dramatic critic in

Hamburg and in 1770 librarian at Wolfenbüttel in Brunswick.

Lessing has been called by Macaulay the first European critic. Through his literary and dramatic criticism, especially the *Litteraturbriefe* (published in Berlin, 1759-65) and the *Hamburgische Dramaturgie* (2 vols., Hamburg 1767-69), as well as through the aesthetic philosophy of his *Laokoon* (Berlin 1766, new ed. 1788; tr. in *Selected Prose Works*, ed. by Edward Bell, London 1890) he did more than any other individual to liberate German letters from French domination and from the theological and Pietistic influences still present in such writers as Klopstock and Wieland. He attacked the dramatic principles of Gottsched, which were based on French rationalism with its neoclassical ideals of false propriety, and he pointed out the greatness of English literature, especially of Shakespeare. English literature, he maintained, was much closer to the German spirit than the French.

Lessing's plays embodied the freshness and freedom from imposed conventions which he dictated as a critic. In *Miss Sara Sampson* (1755) he achieved the first German bourgeois tragedy. *Minna von Barnhelm* (1767) reflects in the character of Major von Tellheim the idealism of the new bourgeois era in contrast to the deception and recklessness of the earlier order. This moral contrast is predominant in all German literature of the eighteenth century. In Lessing's great tragedy *Emilia Galotti* (1772) the contrast becomes political, court and bourgeoisie standing in hostile opposition as the old and the new. The bourgeoisie recognizes the new virtues of the century as its own and the social unscrupulousness which indulges in cabals and intrigue as belonging to and being caused by the courtly circles. In this play one is already aware of the far off thunder of the coming revolution of the bourgeoisie against the absolutism of the court.

In 1774 Lessing began the publication of excerpts from a work of Hermann Samuel Reimarus which were later collected and republished as *Fragmente des wolffenbüttelschen Ungenannten* (Berlin 1784; tr. by C. Voysey, London 1879). These writings, a fierce deistic attack on revealed religion and on the Bible as an inspired book, aroused a storm of protest against Lessing even from the more liberal theological circles. Lessing although not wholly in sympathy with the views of Reimarus brilliantly defended the right of free inquiry in the problems of religion as opposed to the complacency of institutional posi-

tivism. He never definitely formulated his own religious philosophy, but his ideas on religion, on toleration and on general social and political problems received their fullest elaboration in his last drama, *Nathan der Weise* (1779), probably the noblest achievement of the German Enlightenment, in his *Ernst und Falk* (2 vols., Göttingen and Frankfurt 1778–80) and in his *Erziehung des Menschengeschlechts* (Berlin 1780, 2nd ed. 1785; tr. by F. W. Robertson, 4th ed. London 1896). In opposition to the deistic concept of natural religion Lessing approached the history of religions from the thesis of historical development and in this way exerted considerable influence on the subsequent study of comparative religion. He held that religion is not mere blind faith but is a result of an inner experience and finds its true expression in active morality which is valued for its own sake. No positive religion can be considered intrinsically superior to any other. Divisions of religion as well as of class and state are necessary evils that are to be overcome by the ideal of humanity. Mankind's progress is possible only through the striving for truth. The traditional Enlightenment concepts of the best of all possible worlds and the consequent duty of man to submit to God created conditions are no longer accepted without question. Lessing doubts, and instead of the complacent optimism which characterized the period there runs through his work a trail of skepticism and intellectual inquiry which are of enduring significance no matter how remote his explicit preoccupations may become to later ages. He was probably the most important influence in eighteenth century Germany in awakening a new consciousness of the problems of the modern world.

Asthetik, Philosophie (Leipzig 1931); Schrempf, Christof, *Lessing als Philosoph* (2nd ed. Stuttgart 1921); Fittbogen, Gottfried, *Die Religion Lessings* (Leipzig 1923); Kettner, Gustav, *Lessings Dramen im Lichte ihrer und unserer Zeit* (Berlin 1904); Brüggemann, Fritz, "Lessings Bürgerdramen und der Subjektivismus als Problem, Psychogenetische Untersuchung" in *Freies deutsches Hochstift, Jahrbuch* (Frankfurt 1926) p. 69–110; Mann, Georg, "Lessings Pädagogik" in *Pädagogisches Magazin*, no. 1000 (1929); Leisegang, Hans, *Lessings Weltanschauung* (Leipzig 1931).

LETELIER, VALENTÍN (1852–1919), Chilean jurist and sociologist. Letelier was professor of administrative law at the University of Chile from 1888 to 1911 and rector from 1906 to 1911. He was the finest representative of positivist science in Chile and one of the teachers who have in the present century contributed most toward the development of higher learning in education, history, law, political science and sociology. As secretary to the Chilean legation at Berlin he obtained much information regarding educational organization, which he incorporated in several pamphlets. His *Filosofía de la educación* (Santiago, Chile 1892, 2nd ed. 1912), in which he stresses scientific education as the only possible basis for general culture, had a profound influence upon educational criteria in Chile and in other Latin American republics. In his major work concerning historiography, *La evolución de la historia* (first published as *Por qué se rehace la historia?*, Santiago, Chile 1886, 2nd ed. 1900), Letelier examined various sources in order to establish the proper foundations on which historical method should be based and demonstrated the value to sociology which history scientifically reconstructed would acquire. In his teaching he contributed greatly to the modernizing of legal studies with regard to both method and subject matter. He pointed out also the necessity for positivistic methods in the study of political science, holding that devotion to ideologies was the cause of the instability of American democracies. In national politics he sided with the radical groups. An exposition of his ideas on these questions is to be found in *La lucha por la cultura* (Santiago, Chile 1895). *Génesis del estado* (Buenos Aires 1917) and *Jénesis del derecho* (Santiago, Chile 1919), which constitute his main contributions to sociology in both its political and juridical aspects, have earned him well deserved fame. Although not wholly original they nevertheless present generalizations regarding matters not thoroughly defined previously in sociological terms—the active influence upon the state of its population,

territory and cities; the origins and development of contracts, of the law of inheritance, criminal and adjective law—all on the basis of a belief that sexual promiscuity and community of goods characterized society in its most primitive form. The conclusions are supported by rigorously inductive methods and vast erudition; noteworthy is the utilization of materials relating to the New World, sources to which European sociologists had not given much consideration.

LUIS GALDAMES

Other important works: *El hombre antes de la historia* (Copiapó 1877); *Las escuelas en Berlín* (Santiago, Chile 1885); *La instrucción secundaria y la instrucción universitaria en Berlín* (Santiago, Chile 1885), in collaboration with Claudio Matte; *De la ciencia política en Chile* (Santiago, Chile 1886). He also edited *Sesiones de los cuerpos legislativos de Chile, 1811-1845*, 37 vols. (Santiago, Chile 1886-1908).

LE TROSNE, GUILLAUME FRANÇOIS (1728-80), French economist. Le Trosne was king's attorney at the Présidial of Orléans. His early interest was in natural law, but he was soon attracted to the study of economics and became one of the most lucid exponents of the physiocratic doctrine; his views express most clearly the evolution of the school. At first an enthusiastic, inflexible adept of the abstract physiocratic system, he nevertheless evidenced a preference for practical questions, as reflected in his *La liberté du commerce des grains, toujours utile et jamais nuisible* (Paris 1765). Later coming in contact with the detail of fiscal problems he was led to modify the rigidity of the doctrine through recognition of the historical and geographical limitations in the practical application of the principles. He realized that the establishment of the single tax on land would require several years, and he accepted as temporary expedients the maintaining of certain special agricultural land taxes and of the personal *taille* on farmers, provided it be fixed; the creation of a supplementary tax to be paid by the large cities; and even the survival of import duties on foreign

merchandise. Only in politics did he remain obstinately faithful to absolutism—the provincial assemblies which he recommended were to provide only a very restricted administrative competence—and hostile to democracy, that "bizarre and monstrous" government which he doubtless pictured in the form of the violent popular demonstrations against the dealer in wheat or as personified by the vagabonds who had set fire to one of the farms of the magistrate.

LETTRE DE CACHET. *See* CACHET, LETTRE DE.

LEUBER, BENJAMIN (died 1675), German cameralist. Leuber studied at Leipsic and later was appointed Kammer-Prokurator in Lusatia. In this capacity he participated in the task of monetary reconstruction, the most burning issue of the day in Germany. Leuber's chief work, *Ein kurzer Tractat von der Münze* (2 vols., Jena 1623—Halle 1624), influenced the direction of the later development of German political doctrine. He sharply opposed the Roman law concept of the state dominant in his day, which limited the state's function to that of maintaining law and order, and he insisted that the state assume economic functions. He thus became the founder of the doctrine of the welfare state, which was the point of departure for the rise of mercantilism in Germany and furnished fertile soil for the development of subsequent economic thought. His *Tractat* contains the first attempt in German literature to formulate a monetary theory. According to Leuber money developed out of the most marketable commodity; yet he emphatically denies the commodity character of money and develops and separates the concepts of nominal value and intrinsic value, considering the latter as incidental and of only genetic significance and clearly recognizing the function of money as a universal standard of value. Had Leuber's work not fallen into oblivion, the later cameralists might have been able to construct their monetary theories on a foundation which they worked two centuries to create and which in reality they never completely achieved. Leuber was the author of several other books dealing with monetary as well as general eco-

conomic problems, all of which have apparently been lost.

PETER K. H. WESSELY

Consult: Wessely, P. K. H., in *Schmollers Jahrbuch*, vol. lii (1928) 985-1019.

LEVASSEUR, PIERRE ÉMILE (1828-1911), French historian and economist. Levasseur studied at the École Normale Supérieure. For a time he taught in a *lycée* and in 1868 he was put in charge of a course in economic history and history of economic doctrines at the Collège de France, where in 1872 he became professor of geography, history and economic statistics; he also taught at the Conservatoire National des Arts et Métiers.

Levasseur commenced his scientific career with the study *Recherches historiques sur le système de Law* (Paris 1854), which won him the *doctorat ès lettres*. This was the first thesis offered on a subject of this kind in France; before Levasseur only Augustin Thierry and Michelet had applied the historical method to the study of economic phenomena. In 1858, when the discoveries of gold deposits threatened gold with demonetization, Levasseur wrote *La question de l'or* (Paris 1858). A year later he published his main work, *Histoire des classes ouvrières en France depuis la conquête de Jules César jusqu'à la Révolution* (2 vols., Paris; 2nd ed. with title *Histoire des classes ouvrières et de l'industrie en France avant 1789*, 1900-01), which was followed in 1867 by a *Histoire des classes ouvrières en France depuis 1789 jusqu'à nos jours* (2 vols., Paris; 2nd ed. with title *Histoire des classes ouvrières et de l'industrie en France de 1789 à 1870*, 1903-04). Although it may be criticized as to method, details of documentation and occasional overhasty generalization it is a monumental study indispensable to the student of French economic history. The same, however, cannot be said for his *Questions ouvrières et industrielles en France sous la troisième République* (Paris 1907) or for his *Histoire du commerce de la France* (2 vols., Paris 1911-12). Levasseur was a member of the Académie des Sciences Morales et Politiques and prefaced its edition of the *Ordonnance des rois de France, règne de François 1^{er}* (2 vols., Paris 1902-16) with a study of money in the sixteenth century, which was separately reprinted as *Mémoire sur les monnaies du règne de François 1^{er}* (Paris 1902).

HENRI HAUSER

Other important works: *La population française*, 3 vols. (Paris 1889-92); *L'agriculture aux États-Unis* (Paris

1894); *L'ouvrier américain*, 2 vols. (Paris 1898), tr. by T. S. Adams and ed. by T. Marburg, 1 vol. (Baltimore 1900). For Levasseur's method and scope in teaching economics, see his articles "Trente-deux ans d'enseignement au Collège de France" and "L'enseignement de l'économie politique au Conservatoire des Arts et Métiers" in *Revue internationale de l'enseignement*, vol. xl (1900) 5-25, and vol. xli (1901) 211-28, 294-305 and 385-99.

LEVELLERS. It is difficult to establish the exact origin of the term leveller, which in a general sense may be applied to anyone attempting to overthrow existing barriers. As early as 1607 it was used with reference to the peasantry who threw down enclosures in the Midlands, but it was not until Charles I and Cromwell first designated the Interregnum democrats as Levellers that it acquired the precise connotation which has persisted.

The progress of the Leveller movement was due in the main to three factors: the triumph of the less orthodox and more democratic form of Puritanism known as Independency, the position attained by the army in 1647 and the indomitable leadership of John Lilburne. The victory of Independency cleared the way for widespread criticism of established forms of government, secular as well as ecclesiastical. The Independents were taxed with having cast all mysteries and secrets of government before the vulgar and with teaching both people and soldiery to criticize government in the light of first principles. By 1647 the army, which was predominantly Independent in opinion, was in a position of considerable political power; levelling doctrines spread rapidly among its members, particularly among the rank and file, who in cooperation with civilian Levellers drew up the Agreement of the People. From this document, presented to the House of Commons in January, 1648-49, it is possible to form a fairly clear idea of the Levellers' political demands, which despite subsequent amplifications and extensions remained essentially unchanged.

The starting point in Leveller theories was the inalienable nature of individual rights. Richard Overton in *An Arrow against All Tyrants and*

Tyranny (1646) declares that "to every Individuall in nature, is given an individuall property by nature, not to be invaded or usurped by any." Directly deducible from this was the principle of popular sovereignty, which was given its formal expression in the declaration contained in the Fundamental Lawes and Liberties of England (1653) that the people of England are the "sole original" of the authority of Parliament and army and have "all Law and Authority within themselves." The Agreement of the People although containing no such general statement attempts to translate the principle into practise by the introduction of constitutional reforms. To the end that Parliament might be truly representative a reform of the franchise and a redistribution of seats in accordance with the density of population were demanded; the representative assembly must meet every two years, and the electorate must consist of all native Englishmen of twenty-one years and over who are of sufficient economic substance to be "house-keepers" and to be assessed toward the relief of the poor.

From the doctrine of the sovereignty of the people proceeds the most distinctive although not the most enduring contribution of the Levellers to English political thought: their insistence on the doctrine of reserved powers, powers so fundamental and sacred that they must be removed from the control of the elected assembly. This conception of fundamental law, eventually to become alien to the English constitution, was not uncommon during the Interregnum. Men of varied opinions agreed that the constitution should be safeguarded by more rigid means than had prevailed. Cromwell declared his belief in certain fundamentals which should be beyond the power of Parliament to alter. The Agreement of the People restating in explicit terms this doctrine of fundamental powers makes provision for the vigorous curtailment of the jurisdiction of the elected assembly. Religion is removed entirely from its sphere, and fundamental principles are laid down for religious governance. In the same spirit the elected assembly is forbidden among other things to force citizens to serve in a military capacity abroad or to exempt individuals from the power of the laws.

A third feature of the Levellers' political program was the doctrine of the separation of powers. The Agreement of the People forbids any member of a council of state, any army officer, treasurer of public money or practising lawyer

to sit in the elected assembly. *England's New Chains Discovered* (1648-49) states in general terms that it is "an occasion of much partiality, injustice and vexation to the people, that the Law makers should be Law executors."

Although the program of the Levellers remained, in contrast to that of the Diggers, predominantly political in character it gradually came to include a number of social and economic reforms. The latest edition of the Agreement of the People (May, 1649) shows a distinct advance in that direction. The important monopolies of the trading companies were declared to be contrary to the rights of Englishmen to trade freely beyond the seas. Lilburne waged a vigorous warfare against the Merchant Adventurers, toward whom he bore a special grudge; and Walwyn, sometimes suspected of being the most revolutionary of the Levellers, fought the privileges of the Levant Company. The reform of the law both civil and criminal was demanded, particularly the reform of the law of debt and the abolition of capital punishment except for murder. Excise and customs were attacked as weighing heavily on the poor and "middle sort" of people and causing obstruction of trade, and the employment and care of the poor were insisted upon. In their criticism of certain features of the existing land laws the Levellers approached the Diggers most closely. Primogeniture and copyhold were censured, and the *Case of the Armie Truly Stated* (1647) insisted that the "antient rights belonging to the poore," such as rights of common, should be restored.

Cromwell, despite his toleration of many varieties of opinion, condemned the Levellers' proposals on account of their doctrinaire and revolutionary character. Ireton likewise strongly opposed their program, realizing more clearly than did the Levellers themselves that a political constitution founded on the inalienable rights of the individual might lead to revolutionary criticism of the existing economic and social order. The conservative elements of the time were anxious to identify the Levellers with the "True Levellers," or Diggers, and thus to rally a powerful opposition against both. But while it may be argued that advanced political democracy must perhaps unconsciously pave the way for advanced economic democracy, it is not possible to trace a definite connection between the Levellers and the Diggers. The Levellers' doctrines were individualistic, mainly political and secular; those of the Diggers were communistic, mainly social and economic, and strongly religious.

There was, so far as is known, no connection in personnel between the two bodies. The Levellers disclaimed all responsibility for the Diggers' doctrines, and in the Agreement of the People the power to level estates was removed from the competence of the elected assembly.

In the matter of numbers, organization and tactics the Levellers appear to have been far superior to the Diggers. In April, 1649, the members of the Council of State were informed that Winstanley, Everard and their little band of followers had begun to dig up the land on St. George's Hill in Surrey. Winstanley and Everard outlined a utopian program, which they refused, however, to back up with any kind of physical force. Throughout the summer of 1649 the Diggers remained at work on St. George's Hill, but in the autumn a party of soldiers was dispatched to break up their settlement.

The importance of the Diggers lies almost entirely in the realm of theory. In their efforts to eliminate social and economic inequalities, particularly in the ownership of land, they pointed out the inadequacy of political democracy without economic democracy. England would never be a free commonwealth, they maintained, until all the poor commoners had access to the land. The abolition of private ownership in land would improve relations between individuals and between nations and pave the way for widespread social reforms. In one respect the Diggers were more representative of their time than the Levellers, for their theories were saturated with a type of religious mysticism which bore affinities to contemporary Quakerism. Gerrard Winstanley in his *A New-yeer's Gift for the Parliament and Armie* (1650) says that men jeer at the name of Leveller, but "I tell you Jesus Christ, Who is that powerfull Spirit of Love, is the Head Leveller."

The utopia described in unprecise terms by Winstanley (*The Law of Freedom in a Platform*, 1652) represents a vague type of communism. Everyone is to work in cooperation at the task of planting and reaping and the fruits of his labors are to be deposited in storehouses, from which individuals may fetch supplies. The question of education is considered in detail; Winstanley insists that every child must learn some manual trade, as the exclusive devotion to book learning of any one class leads to presumption and domination. The political machinery of this utopia is rather shadowy and is clearly regarded as less important than the social and economic organization. Fathers of families and "overseers"

look after the general welfare of the people. Parliament is retained, but as a court of equity rather than as a legislative assembly. The soldiers are also magistrates and one of their most important duties is the supervision of criminals, who are regarded as erring members of society rather than as outcasts.

The Leveller and Digger movements have often been too lightly dismissed as mere passing phenomena of a stormy period. The influence of both was important in the long run rather than in the immediate future. There is evidence that Lilburne and his followers had a direct influence on Hone and the radicals of the early nineteenth century, while Robert Owen through John Bel- lers was influenced by the history and theory of the Diggers. It seems justifiable to say that the Levellers and the Diggers sowed the first seeds in England of modern radicalism and modern communism.

LEVERHULME, VISCOUNT, WILLIAM HESKETH LEVER (1851-1925), British industrialist. Entering his father's wholesale grocery in 1862 he helped expand its trade well beyond its original compass and by 1884 was ready to retire or to specialize on the wider marketing of some article; he finally decided almost accidentally on soap.

From the beginning he pioneered by producing in large quantity a staple article of good quality to sell at a low price under an attractive registered label. In addition he devoted much attention to advertising and industrial research. Within two years after its establishment in 1885 the manufacturing works at Warrington proved too small and Port Sunlight was begun. It be-

came far more than a soap works. Lever made it a model industrial village with homes for its workers, well paved roads, schools and community centers. The empire of Sunlight Soap had laid its corner stone. Its development proceeded along well defined lines: horizontally, by the purchase and construction of associated works throughout the globe; vertically, by world wide acquisition of raw materials and other ingredients necessary for soap manufacture.

It was in the realm of labor relations that Leverhulme won his widest popular recognition. Motivated by a creed of enlightened self-interest he assured his workers at Port Sunlight a notable degree of security and decency in living and working conditions. Port Sunlight was not the first model industrial village in England, but it remains the chief forerunner in large scale town planning entirely for the workers of one plant. Always convinced of the efficiency of a shorter working day, Leverhulme was a pioneer in the introduction of the eight-hour day and an early advocate of a six-hour day. Provision was made for industrial education by schools and colleges, which became constituent parts of the Port Sunlight works, with periods for study granted from the workday. Other features were profit sharing (without, however, management sharing), old age pensions, group life insurance, half pay sickness allowance and unemployment benefits supplementing state benefits to assure the workers half pay during involuntary layoff. Leverhulme accepted high wages as an essential of a highly productive economy.

LEVI, LEONE (1821-88), English economist, statistician and jurist. Levi, who was born in Ancona in the Papal States, came in 1844 to Liverpool, where he engaged in commerce and was naturalized. He combined theoretical and practical activity in the fields of business and politics and was instrumental in effecting many reforms, all centering around his major interest of promoting commerce through the improvement of international relations. He aided the formation of chambers of commerce in Liverpool and other industrial centers. His *Commercial Law, Its Principles and Administration* (2 vols.,

London 1851-52) is a pioneer work in comparative law based on a study of the legal systems of sixty countries; it had considerable influence on British legislation. He strongly urged commercial arbitration in his book *On the State of the Law of Arbitrament and Proposed Tribunals of Commerce* (London 1850). The legislation of 1854 on this subject was influenced by him. His interest in international peace led him into both the more general field of international law and such specific proposals as a council of international arbitration, to which nations were to elect delegates and which would use moral authority to settle disputes and prevent war. He made a statistical study of the economic and class distribution of taxation and urged that it be placed on a more equitable and revenue yielding basis. Levi was concerned also with justice to the wage earner; his book *Wages and Earnings of the Working Classes* (London 1867) is a comprehensive survey based upon statistical and other material from official sources, in which he made some of the earliest estimates of real wages, insisted that lower hours of labor "have increased, not diminished, production" and urged arbitration of labor disputes. His chief work was his *History of British Commerce and of the Economic Progress of the British Nation, 1763-1870* (London 1872, 2nd ed. rev. to 1878, London 1880), a pioneer work in business history. Levi made considerable use of statistics, to the development of which he contributed notably; he consistently endeavored to relate theory and argument to the available statistical material. He edited the monumental statistical summary of parliamentary papers, *Annals of British Legislation*, of which fourteen volumes were published in 1856-65 and four supplementary volumes a few years later. Levi was a professor of commercial law at King's College, London, a member of the bar of Lincoln's Inn and also a representative of the Royal Statistical Society at several European congresses.

LEVY LAWSON FAMILY, British journalists. Three generations of this family have been identified with the London *Daily Telegraph*. Joseph Moses Levy (1812-88), educated under Thomas W. Hill and in Germany, became in 1855 proprietor of the *Sunday Times*. Two months after the founding of the *Daily Telegraph* on the repeal of the newspaper stamp tax in 1855 Levy, who had been its printer, acquired it in payment of a debt. He at once reduced its price to one penny thus making it the leader of the new "cheap press." His business acumen and the journalistic flair of his son Edward (1833-1916) enabled the *Telegraph* to struggle on until, with the repeal of the excise on paper in 1861, it established itself on a firm financial basis. By 1871 "Jupiter Junior," as the *Telegraph* was dubbed with a hint of its rivalry with the *Times*, had a circulation of 200,000, treble that of the "Thunderer" itself. In 1885 Edward Levy, known since 1875 as Levy Lawson (Lawson was the name of an uncle) took over sole control of the paper. An ardent supporter of Gladstone until 1878, he then opposed the Liberal policy on Turkey and Ireland and was henceforth an advocate of imperialism and a strong navy. In 1903 Levy Lawson, now Lord Burnham and regarded as the dean of English journalism, retired. The *Telegraph* passed to his son Harry Levy Lawson (1862-), First Viscount Burnham, who sold it in 1928.

The *Telegraph*, decried by Matthew Arnold as the quintessence of rowdy Philistinism, was the greatest English journalistic success of its generation. Sacrificing dignity for vivacity and "human interest" it proved that "news" was not of necessity a heavy or serious matter. It cultivated a conversational style ("Telegraphese"), exemplified by G. A. Sala's writing; was not ashamed of emotion, whether tender or chauvinistic; and was an innovator in catering to women. Under the first Lord Burnham the *Telegraph* in conjunction with the New York *Tribune* sent Stanley to complete Livingstone's work in Africa, it raised famine and war relief funds and in general, as the *enfant terrible* of journalism, prepared the way for Northcliffe and a later journalistic revolution, which it managed to survive.

LEWIŃSKI, JAN STANISLAW (1885-1930), Polish economist and sociologist. Lewiński was professor at the School of Higher Commercial Studies in Warsaw. Early in his career he became interested in economic history. He believed that increase of population offers the most important clue to the explanation of economic development and attempted to provide an inductive affirmation of this thesis in his books *L'évolution industrielle de la Belgique* (Instituts Solvay, Études sociales, no. vii, Brussels 1911) and *The Origin of Property* (London School of Economics and Political Science, Studies in Economics and Political Science, no. xxx, London 1913). In the former he concluded that increase of population was the most powerful factor in bringing about the industrialization of Belgium; in the latter he showed that increase of population and consequent scarcity of land forced the transition from nomadism to settled agricultural life, which inevitably led to the rise of private property.

Later Lewiński turned his attention to problems of money and credit. He attacked the logical validity of the quantity theory of money and opposed the view of leading contemporary economists who believed in the possibility of stabilizing the general price level through central bank action. According to Lewiński the influence is in the opposite direction: from price movements to the volume of credit. He pointed out further that the theory of price control through the control of credit had as yet found no empirical confirmation and maintained that the possibilities of price control by the banks or emission are especially limited during periods of depression. While essentially a follower of classical economics, Lewiński viewed with skepticism the achievements of the newer economic theory.

LEWIS, SIR GEORGE CORNEWALL (1802-63), English scholar, statesman and political theorist. Through his Oxford education Lewis was turned toward the classics. At the age of twenty-five he was able to pursue his interests through classical, German, French and Italian literatures. One of his first publications was a small treatise on the unsatisfactory state of the terminology of political science, which was followed by a number of scholarly articles in various English periodicals. By reason of a lengthy and varied political experience upon commissions of inquiry, in Parliament and through the holding of several cabinet portfolios Lewis' attention was increasingly devoted to political theory. His work on the government of dependencies and his inquiry into the influence of authority in matters of opinion appeared at times contemporaneous with the importance of questions of colonial policy and Chartist agitations respectively. His mature work, however, remained to be incorporated in the two-volume treatise on methods of observation and reasoning in politics. Before Lewis became active in politics he came to the conclusion that government was a matter of contrivance and design, capable of improvement by intelligent men. In holding this idea he was unquestionably influenced and supported by personal contact with John Austin and J. S. Mill as well as by his vast reading. Particularly did Austin's analytical methods leave their mark upon him. He found, however, that precision and intelligent direction could not be so easily applied in the solution of concrete problems of government. This difficulty could be overcome only by the establishment of political science upon sound foundations, and it could not be so established until its theoretical basis was worked out. Impressed by the progress that had been made in the physical sciences and by Bacon's ideas and meanwhile integrating his speculations on certain aspects of history and historical method, Lewis set to work upon a comprehensive treatise on the content and methodology of political science. He defined the content as "the nature and acts of a government, and the acts and relations of men as determined by, or affecting, the government." He applied his method of precise definitions and analysis. The most original part of the treatise deals with the relation of history to politics and the extent of the possible application of physical science methodology in politics.

J. G. HEINBERG

Important works: Remarks on the Use and Abuse of

Some Political Terms (London 1832), reprinted with notes and appendix by R. K. Wilson (Oxford 1877); *An Essay on the Government of Dependencies* (London 1841), reprinted with an introduction by C. P. Lucas (Oxford 1891, rev. ed. London 1901); *An Essay on the Influence of Authority in Matters of Opinion* (London 1849, 2nd ed. 1875); *A Treatise on the Method of Observation and Reasoning in Politics*, 2 vols. (London 1852); *Letters . . . to Various Friends*, ed. by Gilbert F. Lewis (London 1870).

LEXIS, WILHELM (1837-1914), German economist and statistician. Lexis, the son of a physician, originally devoted himself to mathematics and the natural sciences; in the 1860's he became a publicist and a self-taught economist. In 1872 he was appointed to the chair of economics at the University of Strasbourg and from 1874 to 1876 was professor of geography, ethnology and statistics at Dorpat. After teaching economics at the universities of Freiburg i. Br. and Breslau he went to Göttingen, where he taught economics from 1887 until his death. Because of his great organizing ability and amazing erudition Lexis was an invaluable coeditor of the first three editions of the *Handwörterbuch der Staatswissenschaften* and after 1891 of the *Jahrbücher für Nationalökonomie und Statistik*. He was also an irreplaceable aid to his friend Althoff, the power in the Prussian Ministry of Education, with which he became officially connected as an independent expert in 1893. Among the semi-official reports which appeared under Lexis' direction and in large part from his pen was the monumental work *Das Unterrichts-wesen im Deutschen Reich* (4 vols., Leipsic 1904).

Lexis was a scholar of encyclopaedic range and an acute and alert thinker. He began with a comprehensive account of the French export bounty system (Bonn 1870) and published in the same decade a study of employer and employee organizations in France (Verein für Sozialpolitik, *Schriften*, vol. xvii, 1879). The latter reflects Lexis' stand as a socialist of the chair, which later caused him to reject the doctrine that scholars as such should abstain from value judgments. His most general work in the field of economics is the *Allgemeine Volkswirtschaftslehre* (Die Kultur der Gegenwart, sect. ii, vol. x, pt. i, Berlin 1910; 3rd ed. with critical introduction by Karl Diehl, Leipsic 1926); clear, concise and of lasting value, it is an independent treatise which adopts business concepts wherever possible and tests deductive conclusions in the light of eco-

nomic realities. He assimilated the terminology of labor value to such an extent that he was occasionally mistaken for a socialist.

Lexis' mathematically trained mind found its greatest satisfaction where it could operate with exact concepts and with data capable of numerical treatment; hence his preference for subjects like money, statistics and insurance. Regarded as a high authority by both sides in the bimetallic controversy, he deviated temporarily and only in a few particulars from the position of consistent gold monometallism. He rejected paper money because of its liability to abuse but became convinced after a study of Austrian and Russian monetary history that a stable paper currency is possible under certain circumstances. His most original contributions were in the field of mathematical statistics. Special mention must be made of his theory of statistical dispersion, recognized as a great scientific achievement, and of a new method of graphic treatment of mortality, first broached in his *Einleitung in die Theorie der Bevölkerungsstatistik* (Strasbourg 1875) and developed in later publications. He made use of the results of these studies in his seminar in insurance—the first of its kind, later introduced in many universities—which he conducted with great success at the University of Göttingen from 1895 to 1914. His Göttingen lecture course on the economics and statistics of insurance became a model for instruction in insurance economics in other German universities.

KARL OLDENBERG

Consult: Borkiewicz, L., in *Zeitschrift für die gesamte Versicherungswissenschaft*, vol. xv (1915) 117-23; Lorey, W., "Wilhelm Lexis und seine Bedeutung für die Versicherungswissenschaft" in *Nordisk statistik tidskrift*, vol. iv (1925) 31-41; Klein, F., in *Deutsche Mathematiker-Vereinigung, Jahresbericht*, vol. xxiii (1914) 314-17.

LI HUNG CHANG (1823-1901), Chinese statesman and diplomat. After receiving the usual classical education Li Hung Chang entered the civil service. He became attached to the army during the Taiping rebellion and because of his military successes was appointed commander in chief and governor of Kiangsu. He inherited Ward's, later Gordon's, "ever victorious army," whose efficiency insured the defeat of the rebels. In 1867 while suppressing the Nienfei he became viceroy of the Hukwang provinces and from 1870 to 1894 served as viceroy of Chihli and superintendent of northern trade. During this period a great deal of his time was devoted to diplomatic and foreign commercial affairs.

Li Hung Chang stands out among contemporary Manchu officials for his appreciation of the strength of the new forces of the West and for his attempts to cope with them by reforming Chinese administration and by introducing the material features of western civilization. He urged more centralized government, created a modern army and navy, established technical schools and adopted the plan of sending young Chinese abroad for study. He was responsible for the construction of railways and of a telegraph system, the organization of the China Merchants' Steamship Company, the introduction of modern mining machinery, the foundation of a medical college and other progressive measures. Unfortunately the full development of many of these projects was arrested by official conservatism or corruption.

But it was in foreign affairs that Li's influence was paramount. Aware of China's weakness, he insisted on a policy of conciliation, which he supplemented by diplomatically setting the powers against each other and by creating through the foreign press an exaggerated idea of China's military power. His masterly diplomatic abilities were, however, heavily handicapped by China's continued weakness. Among his achievements were the settlement of the Margary murder case with England, of the Franco-Chinese war and of the inhuman coolie traffic with Peru. When the long drawn out duel with Japan over the Liukiu Islands and Korea ended in a war which revealed the superficiality of China's military reorganization, Li lost his prestige. He was restored to power to negotiate the Shimomoseki treaty and by gaining the intervention of Russia, Germany and France succeeded in avoiding the stipulated cession of southern Manchuria to Japan, but at the eventual cost of the Russian lease and railway concessions in Manchuria with their attendant complications. His fear of Japan constantly forced him into a pro-Russian policy. His last service was to save the Manchu dynasty by negotiating with the victorious European powers after the Boxer outbreak, again winning concessions with the aid of Russia, in return for which the latter demanded a virtual protectorate over Manchuria.

WILLIAM JAMES HAIL

LIABILITY. Although the term is used also in other senses, its most accepted meaning is a situation in which one may exact legally and

another is legally subjected to the exaction. One of the persistent problems of jurisprudence is how to explain and systematize these situations in which one may exact from another that, as the Roman law formula puts it, he "give or do or furnish" something for one's advantage. A general theory of liability in this sense is constantly referred to as the basis of legal reasoning and by way of critique. The Roman texts conceived in terms of natural law speak of a bond of right and law whereby the one may justly and lawfully exact and the other is bound in justice and law to perform. The analytical jurist speaks of rights in personam—legally recognized and enforceable claims against definite particular individuals. But obligation, the Roman and civilian term for the relation of the parties to such a right, is an exotic in that sense in the common law world. The Anglo-American lawyer, thinking procedurally, speaks of contracts and torts, using contracts in a very wide sense to include situations giving rise to duties of restitution enforceable procedurally *ex contractu*. Thus liability may be looked at from the standpoint of the acts or events giving rise to the capacity of exaction and duty of performance (as in the common law mode of speech—contract, quasi-contract, tort), from the standpoint of the relation (as when Romanist and civilian speak of "obligation"), from the standpoint of the capacity to exact (right in personam, active obligation) or from the standpoint of subjection to the exaction (passive obligation). As the relation is not the significant thing for systematic purposes and the phrase right in personam and its correlative right in rem are apt to be misleading, there is a general tendency to use some word denoting the whole situation (liability, *Haftung*) or, as Demogue does, to define obligation in terms of the situation rather than of the relation.

One historical starting point of liability is recovery of money by way of penalty for a private wrong. One who did an injury or stood between an injured person and his vengeance by protecting a kinsman, a dependent person or a domestic animal that had done an injury must compound for the injury or bear the vengeance of the injured. With the putting down of the feud as a recognized remedy payment of composition becomes a duty rather than a privilege or, in case of injury by persons or things in one's power, a duty alternative to one of surrendering the offending dependent or thing. Later composition comes to be measured in terms of the injury rather than of the vengeance to be bought off and

composition for vengeance becomes reparation for the injury. As a result of this history the Roman law world thinks of the wrongdoer as debtor to the injured person for the reparation.

Another historical starting point of liability is recovery of a thing certain or, what was originally the same, a sum certain, promised in such a way that the failure to carry out the promise would endanger the general security. One might in making a promise have called the gods to witness, and the polity might give a legal remedy to the promisee lest he invoke the aid of the gods and jeopardize the general security. Or one might have called his neighbors to witness and a legal remedy might be given lest the affronted neighbors, invoked by the promisee, threaten the peace. Such things happened when, for example, composition was promised for some injury not specified in the legal tariff of compositions or where one who held another's property for some temporary purpose failed to return it. Before the days of coined money it was hard to distinguish between lending a horse for the borrower to ride to town and lending a cow to enable the borrower to pay a composition. The Roman condition, which as the type of actions in personam is the historical starting point of rights in personam as well as of theories of obligation, was at first a recovery of a thing certain due upon promises of this sort.

When lawyers began to generalize and to frame conscious theories, the crude beginnings of liability in a duty to compound for insult or affront to man or gods or politically organized society, lest they be moved to vengeance, became liability to answer for injuries caused by oneself or done by persons or things in one's power and liability for certain promises made in solemn form. Thus arises a twofold basis for liability—the duty to repair injury and the duty to carry out formal undertakings—which has persisted in subsequent theory. But the resulting categories of delict and contract do not represent any inherent requirement of legal thinking. They are historical products.

In the seventeenth and eighteenth centuries philosophical jurists, applying rationalist method to the Roman formulae calling for the judgment demanded by "good faith" in particular relations or transactions, sought to develop logically the "nature" or ideal form of situations where liability was asserted or recognized. And it proved easy to fit the two historical categories—formal undertaking and delict—into this mode of thought. The duty to perform an inten-

tional undertaking seemed to rest on the inherent moral quality of a promise which made it intrinsically binding on an upright man. The typical delict was intentional aggression upon the person or the substance of another; hence the significant basis of delictal liability seemed to be the moral duty to repair an injury caused by wilful aggression. Liability under both categories rested on the demands of good faith in view of intentional action.

Nineteenth century jurists substituted for this ethical conception a metaphysical one. They conceived of law as realizing an idea of liberty. The highest good was a maximum of abstract free individual self-assertion. The end of law was to bring about the widest possible abstract individual liberty. A regime of voluntary assumption of duties was the rational outcome of the universe; it was the ideal toward which evolution continually tended. Hence the growth of law must be in the direction of giving the widest possible effect to the declared will and imposing no duties except to effectuate individual wills or reconcile individual wills in action. Accordingly liability could flow only from assumed duties or from culpable conduct.

It was not possible to adjust the actual precepts of legal systems to this will theory of liability. An appearance of adjustment was brought about where settled rules of law held men answerable in the absence of actual culpability by assuming a culpability as established by the fact of liability. Also where one was held to duties without any undertaking, it was said that an undertaking was implied. But the historical jurists did not hesitate to say that cases of legal liability without fault were only historical survivals which should be eliminated, and they came very near to establishing throughout the world an ideal of no liability to repair injuries except in case of fault. Indeed the law in continental Europe for a time came very near to a consistent scheme of delictal liability for fault and for fault only, and the conception of a legal transaction came very near to establishing a regime of liability for all intentional declarations of will to be bound. But it was never possible to fit quasi-contractual liability into this theory, and many cases of delictal or quasi-delictal liability without fault obstinately persisted in spite of the theory.

In the present century the tendency is to give over the will theory of liability and to hold that the law gives effect (or should give effect) to the reasonable expectations arising out of conduct, relations and situations. In the civilization of

today men must be able to assume that those with whom they deal in the general intercourse of society will act in good faith, that others will commit no intentional aggressions upon them, that when others act affirmatively they will do so with due care and that where one maintains potentially dangerous things or employs potentially dangerous agencies he will keep them in check. The reasonable expectations involved in these postulates of civilized society and their corollaries are the basis of recent theories of liability.

LIABILITY INSURANCE. See COMPENSATION AND LIABILITY INSURANCE; CASUALTY INSURANCE.

LIANG CH'I-CH'AO (1873-1929), Chinese scholar, publicist and statesman. At the age of eighteen Liang joined the reform movement under his teacher K'ang Yu-wei and in 1895 served as secretary of the first political meeting in Peking. In the following year he became editor of *Shih wu-pao* (Current affairs). His brilliant advocacy of the modernization of China soon won him widespread recognition. After the failure of the coup d'état of 1898, which had been directed at deposing the dowager empress, he fled to Japan where he remained—except for short visits to Honolulu, the United States and Australia and a secret trip to Shanghai to take part in the unsuccessful rising at Hankow—until the republican revolution of 1911. In Japan he edited successively *Ch'ing yi pao* (Public opinion), *Hsin min ts'ung pao* (New people), *Chen luen* (Political review) and *Kuo feng pao* (National movement); of these the *Hsin min ts'ung pao* was the most important. Abandoning K'ang Yu-wei's idea of a Confucianist revival he popularized western political philosophy and history, openly attacked the Manchus and criticized Chinese political thought and social institutions. He invented a new style of vigorous and lucid writing and introduced a new freedom into Chinese prose by adopting foreign terms and colloquial expressions. Liang became a predominant influence in Chinese intellectual life; the *Hsin min ts'ung pao* achieved the relatively enormous circulation of 20,000.

Although before 1911 Liang had advocated a constitutional monarchy as a bulwark against recurrent revolutions, once the republic was established he supported it loyally. Opposed to the 1913 revolution, he served as minister of justice in Yuan Shih-kai's government, resigning when he discovered that Yuan was plotting against the republic. In 1916 he led the armed opposition against Yuan's monarchist coup d'état and in 1917 joined Tuan Ch'i-jui in suppressing the restoration, becoming minister of finance. Throughout these years Liang was the recognized leader of the *Chin pu tang* (Progressive party). He was chiefly responsible for China's joining the Allies in the World War.

With the continuation of civil war after 1917 Liang retired from politics. He attended the Paris Peace Conference of 1919 and upon his return to China devoted himself to literary and historical studies, trying to make a critical reevaluation of Chinese culture. Some of these were written in the spoken language, as he was an enthusiastic supporter of the literary renaissance

which aimed at the replacement of the dead classical language by the living tongue. He lectured in the various universities and from 1924 to 1928 was research professor at the University of Ts'ing-hua.

LIBEL AND SLANDER are the two branches of the Anglo-American law of defamation. If the defamatory matter is given a permanent form by some such method as writing, printing or painting it is libel; if the form is merely temporary, such as spoken words or gestures, then it is slander. The division is thus based upon the method of publication. Many legal systems regard written defamation as more serious than that which is merely spoken, but Anglo-American law is peculiar in clinging to separate bodies of law for what it regards as distinct wrongs.

The illogical common law distinction between libel and slander can only be understood historically. The concept of slander was the first to take shape. Anglo-Saxon law like other Germanic laws had little to say about ordinary defamation although it took a serious view of insult by word or gesture, which it visited with savage penalties, such as the excision of the tongue. After the Conquest the punishment took the newer form of an ignominious withdrawal of the offensive words, and the customs of local courts show that insulting words continued to be punished by them throughout the Middle Ages. The royal courts declined to deal with such trivial matters; hence the rules that a slander is not actionable unless it is published to a third person.

Although in 1295 Parliament emphatically declared that there was no remedy for slander at common law, it had already been forced to take some notice of the spreading of scandalous rumors about great men as a result of which po-

litical disturbances might occur. It was enacted in 1275 that one who repeated such tales was to be imprisoned until he found the originator of them. This provision was reenacted in 1378, and in 1388 the council was given discretionary powers over *scandalum magnatum* in order to protect prelates, peers, judges and certain great officers of state. The peasants who revolted in 1381 complained of the law of *scandalum magnatum*, which seems to have been used oppressively. Later legislation in 1554 and 1558 appropriately described the offense as "seditious," but by a curious change it soon after was construed as giving only a civil remedy for slander, by way of an action on the case for damages, to the persons mentioned in the statutes.

The church also punished those who defamed their neighbors. It would seem that this jurisdiction developed by extending the punishment of those who laid false criminal charges to include those who merely imputed crimes. As a great variety of moral lapses were crimes in ecclesiastical law, it followed that a large number of slanders could be prosecuted on these grounds, and the church retained this jurisdiction in theory until 1855. As an unfortunate consequence of this the common law refused a remedy in those cases where the church had jurisdiction by reason of an imputation concerning matters of spiritual cognizance. The ground for this refusal was supposed to be the impossibility of trying in a secular court the truth of such an imputation if it were pleaded as a defense. Moreover by means of prohibitions the common law courts strictly confined the church to the criminal side of its jurisdiction and forbade any award of money compensation to the injured party.

The common law, however, finally developed an equivalent doctrine for matters within its own jurisdiction, and thus in the sixteenth century an action for damages was allowed when there was an imputation of a crime punishable in a common law court with imprisonment. Such a slander was said to be actionable per se, since it was unnecessary for the plaintiff to prove special damage. Early in the seventeenth century two other classes of slander were settled as actionable per se; namely, the imputation of leprosy or venereal disease and reflections upon a man in respect of his office, profession or trade. There was great reluctance to make any further addition to these categories, and it was not until the Slander of Women Act of 1891 that the imputation of unchastity in a woman was made

actionable per se without proof of special damage, although in the city of London and a few other localities it had been so since the Middle Ages.

Late in the sixteenth century the common law courts had also given a remedy for slanderous words of every sort, even those imputing merely ecclesiastical offenses, if temporal damage resulted. It would seem that such a remedy had existed as early as the fourteenth century in the county court, although not in the central courts. Early in the seventeenth century therefore the common law had already established the main principles of slander as they exist today, tradition associating Sir Edward Coke with the work of laying their foundations.

Although the special law of libel still remained to be developed, there resulted an immense flood of litigation, which seriously embarrassed the courts. In order to stem the tide they hit upon the singular expedient of diminishing the quality of their justice in order to reduce the demand for it. To this end they insisted upon very elaborate pleading, inventing a great many rules governing the use of the colloquium, which sought to set out the circumstances in which the words were spoken and to show that they were in fact directed against the plaintiff, and the innuendo, which explained the defamatory meaning of the words where it was not immediately apparent. Words were construed as innocent if by any perversion of grammar or logic they could be twisted from a defamatory meaning.

In the meantime another line of development was taking place in the prerogative courts. Since the statutes on *scandalum magnatum* were now rarely invoked and had come to be regarded as civil rather than criminal in their scope, the lack of criminal law on defamation was being felt. The Privy Council and Star Chamber had from the first exercised strict control over the press, and soon all kinds of "libels" (written or spoken) attacking public officers were rigorously dealt with. New rules appeared. Publication to a third person was not necessary to constitute the crime; repetition was as serious as originating a libel; merely to possess without publishing a libel was "perilous." Libels on private persons were treated on similar lines, for they too tended to provoke violence and disorder, particularly dueling. The truth of the statements (always a defense at common law) was not a defense in the Star Chamber if the defamation were in writing, and libels upon the dead were equally punishable as provoking disorder. Although the Star

Chamber did not confine the word libel to writings only, any more than the common law restricted slander to words, yet it seems to have regarded spoken and written defamation as needing different treatment. Writing, it was held, greatly aggravated the offense, which consisted in the manner of defamation, and so truth could not constitute a defense; when defamatory words were only spoken, however, it was the matter that counted, and so its truth was a good defense.

These developments were crystallized in the well known case *De libellis famosis* (5 Rep. 125) decided in 1606, which demonstrates that the judges of the Star Chamber had been influenced by the Roman law but that they had misapplied it. In the early Roman law the abusive chant or song had been punished capitally, while less grave forms of insult were classified with physical affronts as *injuriae*. The praetor later gave an *actio injuriarum aestimatoria*, whereby the defamed might be awarded damages proportioned to the gravity of the offense and its publicity, and in the time of Sulla the *lex cornelia de injuriis* imposed heavy criminal penalties, which later imperial legislation retained more especially for anonymous attacks by means of epigrams or pasquinades, the so-called *libelli famosi*. It was thus not the mere form but the character of the matter published that constituted the offense.

The abolition of the Star Chamber in 1641 compelled the common law courts to decide how much of its jurisdiction was worth retaining and how far its doctrines were capable of blending with the common law. This was the especial task of the Restoration judges, and they began (in a judgment by Sir Matthew Hale in 1670, *Lake v. King*, 1 Lev. 240) by accepting the distinction which the Star Chamber had already foreshadowed between written and spoken defamation. Since then libel has had its own rules, rules more modern in spirit than those of slander. Since the Star Chamber, although primarily a criminal court, not only punished the libeler but occasionally awarded damages to the injured party, libel may still be treated according to circumstances as either a tort or a crime, thus differing from slander of a private person, which was never criminal. On the other hand, the criminal definition of libel was so wide that there have survived forms of libel which are criminal although not actionable; examples are libels upon the dead and upon a sect or class of people, where no particular individual is indicated. Again, since the Star Chamber had no forms of action, the rules of special damage which are character-

istic of those slanders that are not actionable per se were likewise avoided. Finally, since the Star Chamber did not use a jury, the King's Bench, when it assumed jurisdiction over libel, confined the function of the jury to finding such facts as authorship and publication, reserving for the bench the question whether those facts constituted a libel. A long succession of political libels in the eighteenth century showed so clearly that the King's Bench was the successor to the spirit as well as to the letter of the Star Chamber's law of libel that finally in 1792 Fox' Libel Act was enacted, allowing the jury to find a general verdict in cases of criminal libel.

The earliest of the defenses to defamation to become established was "justification": proof that the statement was true. This very soon became the rule in slander and was extended soon after the Restoration to the tort of libel, although as a result of the Star Chamber tradition it was not available against a criminal charge of libel until Lord Campbell's Libel Act of 1843 allowed truth to be proved even in criminal cases, if it could be shown that publication was for the public benefit. Furthermore since the Star Chamber had customarily described written libels as "malicious," confusion resulted for two centuries from the gradual changes in the meaning ascribed to malice in connection with defamation. By the end of the nineteenth century, however, malice remained important principally when a defense of "privilege" was interposed. If malice is proved in such cases, the defense of privilege fails.

Ordinarily privilege is a defense to both civil and criminal proceedings. An example of absolute privilege is that attaching to parliamentary papers under the act of 1840 (3 & 4 Vict., c. 9) which was passed in consequence of the denial of absolute privilege by the courts in the famous case of *Stockdale v. Hansard*. "Qualified privilege" will cover a large variety of cases where defamatory statements, true or false, have been made in the course of business, family or personal communications. References by employers and bankers are common examples. The defense of privilege in such cases is available only if the statements were made by and to persons having an interest in the subject matter of the communication, and the privilege can be destroyed by proving malice.

The rise of large newspapers brought special problems, for their power of inflicting injury was enormous, although the conditions under which they were produced made it difficult for them to

take precautions. Lord Campbell's Libel Act allowed the publisher of a libel to show in mitigation of damages that he had published an adequate apology; and in criminal cases newspaper owners were allowed to show that a libel was published without their authority or consent and that it was not due to their want of care. Journals still, however, incurred heavy risks. For example, a fair and accurate report of proceedings in town councils and other public meetings might contain defamatory matter. The Newspaper Libel and Registration Act of 1881 gave injured persons the means of discovering the true owner of a newspaper from the register and gave the paper some protection in reporting public meetings; this was enlarged by the Law of Libel Amendment Act of 1888 into a qualified privilege which would fail only if the paper had acted with malice or refused to print a reasonable letter of contradiction or if the matter was not of public concern. The privilege long attaching to reports of judicial proceedings does not cover "obscene" matter unless in professional or scientific periodicals or books.

Literary, dramatic and artistic criticism has long been a prominent feature of journalism, whose province in fact extends to all matters of public interest. During the last century the press has greatly gained in liberty by a line of decisions which recognize "fair comment" as a defense. Such matter must be really comment and not imputations of fact; such comment, although it may be strongly expressed, must be "fair," which does not necessarily mean that the comment must be unprejudiced or well informed; and it must be on a matter of public interest. This last point is one for the judge to decide. Certain sections of the press invade also the privacy of persons in the public eye in ways which are most reprehensible, although perhaps not illegal. The growing need for the protection of the right to privacy is at present very imperfectly met by the law of libel.

Libel and slander have so far been considered in connection with injuries to reputation and attacks upon government, morals and religion; but the term slander also covers false statements causing damage which are directed not against a person's reputation but against his property. It is a curious result of the early date of this development that the word slander in this connection covers written as well as spoken words. The earliest form was slander of title to land, whereby the owner lost a sale which was pending. Cases of this sort occurred late in the sixteenth cen-

tury; and a century later the principle was extended to other situations, notably advertisements, which at that time were largely in the nature of vigorous disparagements of the wares of rival traders.

The American law of defamation in the main closely resembles the English law. Most jurisdictions took the common law as a basis and enacted modifying statutes similar to the English. The statutes which have attempted definitions of libel and slander have not fundamentally altered the common law concepts of the wrongs. The principal divergence from English law is the extent to which different states admit truth as a defense. New York enacted a statute for this purpose as early as 1805. In many states the class of slanders actionable *per se* has been widened to include not only imputations of female unchastity but also such other imputations as those of adultery, impotence, incest and perjury.

In France during the Middle Ages the local customs punished defamation in a great variety of ways, although at first insult was not distinguished from defamation. Under an ordinance of 1651 the printing of a defamatory libel was punished by whipping and on a second offense with death. In 1757 seditious and irreligious libels were made capital. Printing in general was strictly controlled by the crown by a system of licensing which, abolished during the revolution, was restored during the Napoleonic regime and lasted with interruptions until 1828. The French press, which had taken a large part in the revolution, soon discovered its enormous powers. In 1819 therefore a law was passed to protect individuals against press libels by enacting that truth could not be pleaded in defense. In 1850 it was enacted that all articles of opinion must be signed; and although this law has since been repealed, political articles are still usually signed in the French press. The modern law rests on the act of July 29, 1881, which is virtually a code of defamation and press law and has had enormous influence in European countries. The law imposes the obligation of printing conspicuously a rectification by an official whose acts have been misrepresented or a reply by a private person who considers himself defamed. Defamation is distinguished from insult, and malice is presumed unless the defendant can establish his good faith. Defamation of the dead is punished only when it is used as a means of attacking the living. Truth is a defense when the matter concerns officials and persons in a public position, but no attack on a person's private life can be

justified by the claim that it is true. Statements made at the trial must not be reported in the papers, so great is the concern for privacy. Indeed the principle has been frequently stated in France that there are walls around a person's private life.

The Germanic laws of the early Middle Ages contained schedules of fines for defamation. The law of the later Middle Ages developed means of apology and public retraction, which did not entirely disappear with the reception of the Roman law. The law of the Pandects developed especially the Roman doctrine of the *pasquinade*. The German regional laws from the sixteenth to the eighteenth century for the most part treated defamation as a private delict. The modern German law is similar to the French. Yet although there is a press law, the offenses of insult and defamation are not defined therein but in the general penal code. A more important difference is that truth is regularly admitted as a defense unless the person defamed is deceased.

The Italian penal code which came into force in 1931 contains the most recent continental legislation on defamation. Under the general heading of "crimes against honor" insults addressed to a person incur fine or imprisonment, and the penalty is increased if specific facts were imputed or if other persons were present. Statements injurious to reputation are similarly punished and the penalty is increased if the defamation is printed, if specific facts are imputed or if the injured party is a judicial, governmental or corporate person. Truth is no defense unless both parties agree to submit it to a "court of honor." Relatives may prosecute for the defamation of a deceased person. Defamatory documents may be suppressed, and damages may be awarded when the court sees fit. Provocation by the injured party himself will excuse defamation committed in a moment of anger. Offenses by the press against the state, religion and morals are set out at length.

Thus while the continental law of defamation represents a unified category of wrongs, it contains distinctions of gravity. The provision that permanence of form aggravates a defamation is very common in continental codes. The publicity of a defamation is also very generally taken into consideration. The regard for honorific motives derives from Germanic conceptions, not from the later Roman law, to which such motives were alien. The persistence of the system of licensed printing in continental countries well into the nineteenth century had a particularly

great influence upon the development of their law of defamation. The special continental treatment of the defamation of public officials with respect to their official acts is partly matched by the Anglo-American law of contempt of court, which provides a special protection for judges. Finally, the disparagement of a rival trader's wares, which is still part of the Anglo-American law of libel and slander, is placed more logically by those continental countries which follow the German system within a statutory system of unfair competition.

LIBERAL PARTIES. See PARTIES, POLITICAL, sections for separate countries.

LIBERALISM. In its larger sense liberalism is a deep lying mental attitude which attempts in the light of its presuppositions to analyze and integrate the varied intellectual, moral, religious, social, economic and political relationships of human society. Its primary postulate, the spiritual freedom of mankind, not only repudiates naturalistic or deterministic interpretations of human action but posits a free individual conscious of his capacity for unfettered development and self-expression. It follows therefore as an obvious corollary in the grammar of liberalism that any attempt on the part of constituted authorities to exert artificial pressure or regulation on the individual, in his inner and outer adjustments, is an unjustifiable interference, a stultification of his personality and initiative. Against such coercive interference, whether in the moral, the religious, the intellectual, the social, the economic or the political sphere, liberalism has consistently arrayed its forces.

Although liberalism in this larger sense is a complex pattern of interrelated strands which cannot be disentangled, the term soon came to acquire a more precise connotation as the political implications of liberalism were abstracted and given primary emphasis on the ground that political liberty constituted a prerequisite, and necessary guaranty, of liberty in its broader reaches. At an early stage of its development therefore the forces of liberalism concentrated on the crucial problem of limiting the interference of the state and of transforming state policy into a vehicle for promoting the liberties of individuals and groups.

In the process of formulating its libertarian ideals and objectives political liberalism gradually evolved an explicit system and ideology and, as it drew near to the parliamentary arena, a more specific program. With a view to translating this program into effective action liberalism was

called upon to set up formal agencies which should be, on the one hand, sufficiently cohesive to prosecute a decisive policy and, on the other, sufficiently deliberative to conform to the liberal ideal of a harmonious interplay of opinion, free from coercive pressure on the individual. This compromise was worked out in its most effective form in the liberal parties which during the first half of the nineteenth century came to assume throughout Europe and America the role of parliamentary watchdogs over the activities of the government, attacking any interference with the rights of the individual citizen and gradually extending and embodying in legislation the liberal program. From a principle of social criticism liberalism had become actual governmental practise, and in the process its original ideology had inevitably undergone a certain transformation. In their new role the liberal parties made it their task to eliminate conflicts between authority and liberty. To this end they endeavored to limit as far as possible the sphere of their own influence with a view to avoiding interference with the free play of individual and social forces, to initiate constitutions and laws for the sake of safeguarding the rights of liberty and, finally, to utilize their authority for increasing the number and influence of untrammelled individuals and associations. It is through the work of these parties that the liberal states of the nineteenth century assumed shape and solidity. With their institutions of public law, their constitutions, their systems of checks and balances, these states represented both a permanent curb on governmental activity and an embodiment of the continuity of liberal traditions in the various countries. Thus it came about that although there were frequently periods in which neither the parties nor the governments were formally liberal, nevertheless liberalism itself survived in the institutions of state as well as in political customs which sustained and in turn were sustained by the state.

Viewed in this broader light political liberalism may be said to embrace party ideologies and programs, the work of governments in the interests of social justice as well as the social, juridical and political institutions which form the basis of liberal states. It thus becomes possible to analyze more realistically the contrast which is usually pointed between liberalism and conservatism. The two terms are not essentially antithetic, as is evidenced by the fact that a liberal party upon attaining power inevitably dedicates itself to the conservation of the liberties already

won. The liberal and the conservative do reveal, however, a basic difference in mental outlook. Liberty like every spiritual activity can be preserved only by means of new acquisitions, but the conservative temperament runs the risk of making it overrigid, of converting it into a sacrosanct possession and hence into a privilege; so that whatever the origin of the conservative, he eventually becomes an advocate of the status quo, endeavoring to reenforce it and in this way to increase the privileges of the already privileged classes. The liberal, on the other hand, if he is faithful to his principles, keeps in mind the future as well as the past and sponsors innovations and reforms. Carried to its ultimate conclusions liberalism gives rise to radicalism with its tendency to make a *tabula rasa* of the past and its attempts to introduce into human society a new order based on reason. In contradistinction to the extremist tenets of conservatism and radicalism liberalism represents a flexible equilibrium, which while recognizing freedom as an expansive force tending toward the future values the historical continuity of the actions through which the human spirit gradually realizes itself. Only through these actions, it is felt, can both the individual and society acquire that self-mastery capable of finding a lasting embodiment in new achievements. Liberty as understood by the liberal is attained not by the man who forever starts his life anew but by him who brings to bear upon every action of his life his whole personality.

In European political liberalism the conservative strains of historical tradition have been fused with the progressive strains of abstract rationalism. British liberalism up to the eighteenth century was concerned primarily with conservation, while French liberalism, as culminating in the revolution, proceeded rationally, indifferent on the whole to its political heritage. But under the influence of a group of radical ideologists saturated in continental rationalism British liberalism in the nineteenth century came to emphasize progress at the expense of conservation; while French liberalism, on the other hand, absorbed many historicist and traditional elements as a result of a closer study of the British model. In this way the distance between the two forms, which was originally considerable, gradually diminished.

It is characteristic of the traditionalism of the English liberal spirit of the seventeenth and eighteenth centuries that it was nourished not by a rational definition of the concept of liberty but

rather by a slow and persistent acquisition of liberties—a gradual process of accretion, organic in character. The English, feeling no need to formulate their liberties in a system or to sanction them by a constitution, entrusted their defense to the forces of custom and habit rather than to a rational and abstract doctrine of popular sovereignty. Thus the vindication of liberties devolved upon succeeding social and economic groups which struggled for political dominance rather than upon a single homogeneous class which revolted against privilege under the banner of natural, universal laws.

The unusual vitality of the British nobility, which since early feudal days had constituted itself the perennial champion of liberties and law, may be accounted for by the conscientiousness with which it performed the functions entrusted to it. Actively engaged in the promotion of agriculture and trade, in the administration of justice, in local and parliamentary government, it remained throughout the eighteenth century a dynamic force—a striking contrast to the parasitic nobility of France with its monopoly of privileges divorced from function. When the industrial revolution of the eighteenth and nineteenth centuries conferred a preponderance of power on the bourgeoisie it was turned against the aristocracy not in order to undermine the existing structure, as was attempted in France, but in order to realize for itself a greater degree of participation so as to exploit in its own interests the advantages of traditional liberties. The struggle between the two classes meant therefore not a sudden discontinuity in historic life but a development of one and the same system. Similarly at a later stage the proletarian movement, although inspired by different ideals, pursued and to a limited degree realized its aspirations in the spirit of traditional liberalism, despite the fact that this moderation involved a serious loss of impetus and entailed a moderate program as compared with other countries.

This sense of continuity has on the whole dictated the policy also of the British crown, which beyond a few sporadic outbursts of absolutism—as, for example, on the part of the Tudors and Stuarts—was never in a position to ignore the claims of its more progressive subjects. This royal moderation is attributable primarily to the fact that the vital needs of protection and external defense, which on the European continent strengthened the state at the expense of the liberties of its citizens, were less compelling in the case of an insular people protected by the sea.

The chief instrument of oppression, a readily available armed force, did not exist. The navy, the main defense of England, generated, on the contrary, a spirit of intense individualism and by its very sphere of action was able to escape centralized supervision, while the fact that the army was engaged almost constantly in continental wars tended to eliminate the possibility of armed interference with liberties at home. The two English revolutions were therefore attempts not at undermining the institution of the crown itself, as was the case in France, but rather at curbing the excessive ambitions of the king, who constituted the momentarily disruptive element, and at bringing the crown into line once more with the broader evolutionary development of the life of the country.

Quite different was the character of liberalism in France, which typified rather clearly the political ideals of a continental country. Since the beginning of the modern period France had found herself hemmed in between two great monarchies, Spain and the Holy Roman Empire. The necessity of a continual struggle for existence soon brought the realization of the importance of concentration of forces and also of the need for the overthrow of feudal disorder by a strong centralized monarchy. Although the monarchy did not formally attack the privileges of the feudal classes it degraded their holdings to the role of free appanages and in this way undermined the prestige of the nobles, especially since the public services performed by them gradually dwindled in number. Centralization and leveling were the two most effective weapons of the monarchy and in both programs the rising bourgeoisie heartily concurred. But as the bourgeoisie became richer and more influential, as it acquired, with culture, confidence that it constituted the true generality of the nation, the heedless absolutism of the monarchy became increasingly intolerable. Dissatisfaction became keener with the growing realization that the leveling program had stopped halfway and that the remaining feudal privileges of the aristocracy continued with impunity to galling the shoulders of the bourgeoisie despite the growing importance of its economic functions. With a mounting sense of aggrieved dignity the impatient middle class, convinced gradually of the impasse confronting it, turned after a century of sporadic pressure to revolution; and when the king after a period of vacillating compromise threw his weight into the scales of reaction, no sentiment of tradition was vital enough to save the institu-

tion of the crown from the same extermination which had earlier befallen the aristocracy.

Proceeding from the rational principles of liberty and equality the French revolutionary liberals evolved a logically coherent mechanism for translating these principles into practice. This mechanism, derived partly from Montesquieu's rationalistic misinterpretation of essentially traditional and empiric features of the British constitution, was to a larger extent the outgrowth of the concept of equality as formulated by Rousseau. Whereas liberty involves differentiation and division, equality entails leveling and centralization. Liberty and equality, which find their embodiment respectively in liberalism and in democracy, are thus complementary and at the same time antithetical: complementary, inasmuch as absence of equality, at least equality of opportunity, degrades liberty to the level of exclusive and therefore oppressive privilege; antithetical, inasmuch as equality is conducive to indiscriminate leveling and indirectly to excessive centralization—to the detriment of such bulwarks of liberty as local associations and institutions. Since their first encounter in the heat of the French Revolution, liberalism and democracy have confronted each other in a variety of involved situations. The liberal tendencies of the movement of 1789 were gradually submerged under the democratic wave of 1793, and the latter ignoring the restraining counsels of liberty degenerated into the absolutism of the Convention and the Terror. Eventually, however, as a reaction to the horrors of the Jacobin dictatorship there reemerged the original concern for liberty. The first sustained attempt to solve the problem of restraining democratic excesses through a moderate liberal policy was made by Napoleon. By inaugurating a regime of enlightened Caesarism and especially by his opportunistic codifications he granted to the entire nation civil freedom and security in exchange for political freedom. But his increasingly arbitrary acts and usurpations under the pressure of war revealed to the people the precariousness of civil liberties unguaranteed by political rights and liberties. Accordingly in the nineteenth century, especially after the Restoration, the demands of French liberalism were formulated—notably by Constant, Royer-Collard, Guizot and de Tocqueville—in terms of constitutional guaranties capable of defining and delimiting the authority of the state in the interests of the individual citizen. At the outset chief emphasis was placed on written constitutions, elaborate systems of

checks and balances, minority representation and other devices for counteracting concentration of power, whether emanating from a privileged aristocracy or, as was more threatening, from a democratic majority invoking the new doctrine of popular sovereignty. But as the inadequacy of these devices became more and more apparent, the attention of the Restoration liberals was drawn increasingly to the Anglo-Saxon political system with its reliance on the forces of unwritten tradition and custom, which although they had aroused the scorn of pre-revolutionary rationalists were now revealed in their true light as the mainspring of British local government. Thus decentralization came to assume in the eyes of the French political theorists a preeminent importance as the chief bulwark against absolutism, as the distinguishing mark of a free country. Confronted with the problem of freshening the currents of native liberalism with waters drawn from the English source, they were brought, however, gradually to realize their essentially paradoxical position in attempting to transplant suddenly a vigorous native growth into a different historical climate—a climate moreover particularly uncongenial since the leveling policy of the monarchy had sporadically endeavored for centuries to eliminate inequalities of privilege and the revolution had completed the process. The fusion of the two forms of liberalism therefore became a tendency rather than an accomplished task.

On the other hand, British liberalism of the eighteenth century, permeated as it was with aristocratic elements, was able to resist the impact of the ideas of the French Revolution and managed to direct the awakening popular consciousness into channels of patriotism and hatred for the hereditary enemy. But the protracted Napoleonic wars and the oppression inevitably entailed in war tended to make even more rigid the feudal structure of the ruling class. Simultaneously the new manufacturing class generated by the industrial revolution was becoming increasingly resentful of the rule of the agrarian oligarchy. In conformity with the nature of the English people, however, this resentment expressed itself not in a revolutionary outburst and in a proclamation of general principles of liberty but in a rather precise and programmatic formulation of particular demands calculated to wipe out certain restrictive privileges and regulations. The most serious of these hindrances to the expansion of industrialism consisted in the survival of feudal regulations on manufacture,

which cramped the initiative of the entrepreneur and prevented sorely needed readjustments in the sphere of economic organization and administration. A second serious hindrance was the tariff policy designed by the landed aristocracy to increase its revenues. The resulting rise in the price of agricultural products led to a higher cost of labor and of manufactured articles and consequently hindered exportation. Economic liberalism, or the ideal of free trade, accordingly expressed itself in two closely related demands: internal freedom of industry and external freedom of exportation and importation. Both aspects were subsumed under the single formula of free competition, which was hailed as a stimulus to individual initiative and as a vehicle for natural selection.

This economic liberalism, which was formulated with scientific precision by the classical school of English economists, differs from political liberalism as the species differs from the genus. But if its scientific formulation is independent of political contingencies, its practical realization presupposes the work of parties and governments. Thus its proponents from the beginning of the nineteenth century were forced to learn the practical lesson that it would remain a dead letter without a political reform capable of limiting the preponderance of the landed aristocracy in the government and of assuring political recognition to the bourgeoisie. The transformation of the economic into a political program was the work of numerous radicals from Bentham to Cobden, who imparted to the liberal ideology a rationalistic tinge, partly under the influence of the scientific temper of economic liberalism, from which they derived their inspiration, partly through the repercussions of French political rationalism. There was thus engendered a process the opposite of that which was operative in France; the traditionalistic liberalism of the eighteenth century with its open recognition of privilege became divested of many of its historically conditioned accretions and assumed a more rational and systematic form. The ambitious designs of the radicals, curbed by the tenacious forces of tradition, fused with the older Whiggism to form a composite liberalism in which the old and the new were gradually integrated and harmonized.

The interplay of the French and English types of liberalism constitutes the mainspring of the liberal movement in the other nations of Europe and America. The prevalence of the one or the other type was determined by the peculi-

arities of local complications and problems, arising chiefly from nationalistic currents. In regard to American liberalism two historical interpretations have been advanced by recent scholarship. The one in regarding the American Revolution as an antecedent of the French Revolution and of the Declaration of the Rights of Man assumes that American liberalism derived its inspiration from an ideological and rationalistic source. According to the second and more tenable interpretation the animating spirit of the American Revolution had its source in the traditionalism and legalism of the Anglo-Saxon temperament. According to the latter hypothesis the English colonies were induced to rise against England not by a desire to create a new order in conformity with freedom and equality but by the need for reaffirming traditional liberties against the usurpations of the British crown. Viewed thus the entire movement was a reaffirmation of the classical thesis of Burke, who was as courageous in his defense of American independence as he was firm in his repudiation of the French Revolution. Taxed with inconsistency, he rationalized his position by contrasting the conservative character of the American Revolution, aimed at vindicating a historic Anglo-Saxon custom against English violation, with the subversive rationalism of the French Revolution.

The affinity between English and American liberalism may be attributed to common ethnic origin as well as to geographical isolation and comparative military security, which were conducive in both countries to political and administrative decentralization and therefore to a spread of local self-government. On the other hand, however, there were notable historical differences, such as the absence in America of a hereditary aristocracy and an established church, which rendered the frontier society more open to democratic experiments, and the rationalistic doctrine of equality, which was so much more in evidence in the American bills of rights than in traditional English liberalism. Moreover the cardinal fact that American liberalism resorted to revolutionary means gives additional validity to the historical thesis which interprets the American Revolution as an antecedent of the French.

If on the whole the traditionalistic spirit prevailed in the earliest phase of American emancipation, it tended more and more to fuse with French rationalism, as is evidenced in the ideologies of such revolutionary leaders as Lafayette, Franklin and above all Jefferson, whose

preeminent role in American political life integrated the two different currents of revolutionary thought. Jefferson's early outlook, as embodied in the Declaration of Independence, is in the main saturated with British traditionalism; but during his years as ambassador to France he became deeply versed in the prevailing rationalism of the prerevolutionary salons and on his return to the United States attempted to compress the currents of American liberal thought and practise into the French mold.

In Germany theoretical formulations of liberalism were the work of metaphysical philosophers who translated the ideas and practise of the French into systematic and organic forms more congenial to the German mind. Kant stated the principle of individual liberty and of a society of free individuals, while Humboldt traced the limits of state authority and interference. A more practical stimulus to German liberalism was the tradition of local self-government which had flourished in the German cities since the Middle Ages, a tradition closely akin to that of England. A third stimulus, which had made itself felt ever since the wars of liberation against Napoleon, was the fusion of the ideals of national unification and liberty. These three currents of German liberalism converged in the Revolution of 1848 and in the Frankfort Assembly. In the subsequent period, however, there was a violent anti-liberal reaction attributable primarily to the opposition of Austria—which frustrated a union of German states based on free and mutual consent—to the militaristic tradition of Prussia and to the gradual domination of political thought by the absolutistic formulations of Hegel and Stahl. German unification, divorced from libertarianism, was achieved instead by military victories and Prussian hegemony.

Nineteenth century Italian liberalism had many affinities with the liberal movement in France, because of the ethnic and cultural bonds between the two countries as well as of their intimate historical contacts. There were of course other elements, drawn, especially by Cavour, from Manchesterian liberalism and from those liberal Catholic currents which aimed at making a modernized papacy the unifying center for the Italian states. But of much greater historical importance was the part played by nationalistic demands for independence from Austria and for a unification of the peninsula under a common regime of liberty. By declaring war against Austria and by proclaiming a constitutional order Piedmont assumed the leadership

and successfully set about the solution of the two problems in accordance with the aspirations of the best elements in the nation. In contradistinction to the German experience, however, unification did not entail the hegemony of the dominant province. Instead Piedmont was quietly assimilated into a broader national union, the capital being transferred from Turin to Florence and then to Rome. Unification received its effective sanction through a common liberal regime administered by a Parliament elected by the entire nation.

In the second half of the nineteenth century the principles of liberalism prevailed, with varying degrees of effectiveness, in practically all civilized countries. Where absolutistic and militaristic traditions were more tenacious, the political forms of liberalism were mutilated and attenuated, as under the Second Empire or under Bismarck; where industrial requirements imposed tariff barriers, the doctrine of free trade was held more or less in check; and where the churches were able to preserve at least a part of their privileges, religious freedom was limited. But freedom of conscience, freedom of association and freedom of the press were everywhere recognized in their main outlines. The civilized world presented the spectacle of a free play of forces limited only by self-imposed restraints and by the exigencies of community life as embodied in a non-authoritarian state. The social technique of liberalism found its support in the middle classes, both industrial and agrarian. The hereditary aristocracies remained on the whole unsympathetic, convinced that too great an emphasis on liberty threatened their economic privileges and social prestige. The emerging labor class, on the other hand, did not possess a sufficient degree of economic independence to make it sympathetic to the doctrine of individualistic self-reliance, which seemed to offer slight prospect of escape from the miseries of the factory system. But the predominance of the middle class under the banner of liberalism did not signify, at least in principle, the hegemony of one class over all others. The bourgeoisie opened wide its doors, parading as the "general class," emphasizing common rights rather than privileges and extolling the doctrine of free development of all the forces within the community. Its authority as a leader corresponded to the universality of its functions.

At the same time the very consolidation of liberalism ushered in a decadence which became especially marked and serious toward the end of

the nineteenth and during the twentieth century. The reasons for this decadence are manifold. Above all the attainment of power by the bourgeoisie brought about a situation inherent in every exercise of power: its liberal ideals spent their momentum. If as a champion of liberty this class was full of energy and fervor, as soon as it began to enjoy peaceful possession its ardor was dampened and gave way to conservative calculation and habits of mind inconsistent with the dictates of liberty. If in principle it claimed to exercise a mandate for the entire population, in reality it began to rule chiefly in its own interests and to transform liberties into rigid monopolistic privileges. These tendencies became especially marked under the presence of rising proletarian agitation which forced the group in power to assume increasingly defensive tactics. The reluctance on the part of the bourgeoisie to extend political rights to the people, its vigorous opposition to any measures of social and educational welfare which seemed to interfere with the freedom of enterprise in factories and with individual initiative in society, the creation of the new "baronies" of industry, finance and land—these tendencies were so many checks on the initial liberalism. But even apart from this widespread class selfishness and particularism the general trend of economic life in the nineteenth century favored the appearance of antiliberal forces. When industries were first born in England the best means for furthering their development was through freedom of initiative and through a competition untrammelled by outside chains. Manchesterian individualism was an appropriate expression for this first dynamic phase of expansion. But as soon as industry reached maturity, new needs began to make themselves felt. It became necessary to organize enterprises on larger and larger scales—thus limiting the initiative of the constituent elements—and also to meet growing international competition by protectionism. In defense against concentration by capital labor inaugurated its own program of concentration as the only means for bettering its condition. Both types of concentration assumed dictatorial forms, and the conflict between the two expressed itself in sporadic revolutionary outbursts. Liberalism thus found itself hemmed in between two opposed forces having in common only a basic antipathy to liberal tenets and technique. Individualism proved to be more and more inadequate for satisfying the new organic needs of society. While the political forms of liberalism still remained intact, the conflict for

power between the forces of plutocracy and those of economic democracy threatened to distort them beyond recognition. The concept of a free sphere of activities with an impartial police state gave way to the concept of a state which should be conquered as a vehicle for the attainment of class objectives. Under this double set of forces the jurisdiction of the state was gradually extended far beyond the boundaries surveyed by liberalism. The new state, claiming for itself an ever increasing number of functions which formerly had been the jealous possession of individuals, substituted a centralized bureaucracy for free initiative and by assuming the role of arbiter in social conflicts interfered with the spontaneous play of forces and assured dominance to the holders of power.

Despite these tendencies liberalism has displayed a marked degree of persistence. The very fact that liberal political forms continued to exist often mitigated the conflict of economic groups by transferring in many cases the struggle from the immediate economic sphere, with the threat of head on collision in public clashes, to the scene of parliamentary deliberation, with its greater amenities and traditions of compromise. Moreover despite the element of dictatorial dogmatism a certain amount of liberal ideology seeped down to the rank and file of the labor unions and was thus disseminated among the masses. On the other end the ruling groups often proved themselves sensitive to the needs of the new age. Suffrage was extended, numerous measures of social welfare were carried out and labor unions were given official recognition. These new tendencies were paralleled in the theoretical and ideological realm by a transition from the narrow Manchesterian individualism to a more organic liberalism, as formulated most systematically by T. H. Green and L. T. Hobhouse. The new liberal organon resolves the antinomy between individual liberty and authoritarian organization and directs its major energies to building up spontaneous organizations of individuals. It recognizes that labor unions, far from interfering with freedom of contract, as was believed by the individualists of the old school, are indispensable vehicles whereby the workers, who would be crushed in isolation, can combine to enforce their demands on employers.

These first manifestations of a liberal renaissance were cut short by the World War, which with its hegemonic ideals, its regime of command and subjection, blighted the spirit of liberty. Al-

though in the post-war period the menace of communism, which has forced the capitalistic countries to assume rigid positions of defense, as well as the ill feelings engendered by economic and political nationalism has still further aggravated antiliberal forces, it is possible that extreme oppression may once again generate new stimuli to liberty.

LIBERTY. The basic idea of liberty as a part of the armory of human ideals goes back to the Greeks and is born, as the funeral oration of Pericles makes abundantly clear, of two notions: the first is the protection of the group from attack, the second is the ambition of the group to realize itself as fully as possible. In such an organic society the concept of individual liberty was virtually unknown. But when the city-state was absorbed by the idea of empire, new elements came into play. Stoicism especially gave birth to the idea of the individual and made his self-realization the main objective of human endeavor. Christianity added little to this notion by way of substantial content; but it added to its force the impetus of a religious sanction, not improbably the more powerful because Christianity was in its original phase essentially a society of the disinherited, to whom the idea of the eminent dignity of human personality as such would necessarily make an urgent appeal. In this stage it is difficult to dissociate the idea of liberty from that of equality, with which it is frequently intertwined. But as Christianity became the triumphant religion of the western world, the idea of equality became largely relegated to the theoretical sphere; and the liberty in which the church became interested was that of ecclesiastical groups seeking immunity from invasion at the hands of the secular power. In this aspect the liberty it sought was in essence indistinct from the liberty claimed by other groups in the mediaeval community. For until the end of the fifteenth century, roughly, the defense of particular liberties against invasion by external authority was the work of a functional group, such as the barons of Runnymede or the merchants of London. In this period liberty may be said to have resolved itself into a system of liberties or customary negative rights which were bought and sold between the parties for hard

cash. Custom became codified into law, and the invasion of custom came to be taken as a denial of liberty. There is little that is universal about such a conception of liberty; the group is largely defending itself from attack without undue regard to the interest of other groups. Thus in mediaeval England liberty had no meaning for the villein; and it is hardly illegitimate to argue that those who fought for liberty when they wrung Magna Carta from King John were good syndicalists whose minds were largely bounded by the narrow demands of a small group within the realm. Liberty has been as often the rallying cry of a selfish interest intent upon privilege for itself as it has been the basis for a demand which sought the realization of a good wider than that by which it was itself affected. It is therefore not unfair to describe the mediaeval idea of liberty as a system of corporate privileges wrung or purchased from the dominant power and affecting the individual less as himself than as a member of some group in whom those privileges cohere.

Philosophically no doubt restraint upon freedom of behavior has always been resented as an invasion of individual personality. But historically the best way of regarding the substance of liberty in the modern period as well as in the mediaeval is to realize that the new elements which enter into its composition at any given time have almost invariably been rationalizations of particular demands from some class or race or creed which have sought a place in the sun denied to them. Thus the history of religious liberty has been the demand for toleration by group after group of dissidents from recognized creeds, few of which have been willing to admit the claims of their rivals to toleration. So again the history of the franchise has been the demand of men for the right to share in political power, while many of those to whom the right has been granted have had no difficulty in urging that it was unwise or unjust to admit the next claimants to their place; Macaulay, who urged with passion the enfranchisement of the middle class, opposed not less urgently the grant of universal suffrage on the ground that it would necessarily dissolve the fabric of society.

The Reformation may be said to have been the most important factor in revitalizing the stoic doctrine of the primacy of the individual and in giving a new emphasis to individual rights as a separate and distinct subject of liberty. The breakdown of the *republica christiana* gave birth to new religions; these by demanding toleration

gave birth, even if painfully and in doubt, to the idea of liberty of conscience. The centralization of monarchical power consequent upon the breakdown of feudalism made political liberty more abstract and general than it had previously been; and the discovery of the printing press gave to the idea of freedom of expression within the general concept of political liberty a valuable concreteness which it had never before possessed. Nor is this all. The voyages of discovery synchronized with the emergence of a capitalist economy, and the importance given by the character of this economy to the individual entrepreneur made the problems of civil and economic liberty take on a new sharpness of form. By the time of Locke the idea of the individual as the embodiment of certain natural and imprescriptible rights which authority is not entitled to invade had become a commonplace of political speculation.

In a sense the emergence of the Reformation state on the ruins of the mediaeval commonwealth meant the substitution of the idea of the nation for the idea of the group; and it would not be illegitimate to argue that until the maturity of capitalism in the nineteenth century the struggle for national liberty proceeds along parallel lines with that of individual liberty. The two become until the threshold of our own day the two supreme embodiments of that passion for self-realization which has always lain at the root of the idea of liberty. The nation rejects the subordination of itself to an external authority just as the individual seeks to define for himself spheres of conduct into which external authority is not entitled to enter. Each seeks to make its claims as absolute as possible. The one for that end assumes the panoply of a sovereign state, thereby recognizing no superior; the other attempts to define the limits of governmental interference in terms of wants he discovers as brooking no denial. The history of the search for national liberty resulted in a chaos of sovereignties which stood in sharp contrast to that unified economic life made possible by scientific discovery; and it was clear that the history of the twentieth century would be largely occupied in bringing order into the anarchy to which the struggle for national liberty had given birth.

Something not dissimilar occurred in the history of individual liberty. So long as it was conceived as a body of absolute rights inherent in the individual and entitled to be exerted without regard to their social consequences, liberty was divorced from the ideas of both equality and

justice. The individual became the antithesis of the state; and liberty itself became, as with Herbert Spencer, a principle of anarchy rather than a body of claims to be read in the context of the social process. The reason for this evolution is clear. The body of ideas we call liberalism emphasized the undesirability of restraint, because those who gave it birth had mainly experienced the state as an organization interfering with the behavior they regarded as necessary to self-realization. Because of this they sought to reduce the state to the role of a mere guardian of order, keeping the ring in a vast competition of individual strivings of men who received in the social process the reward to which their effort and ability entitled them. *Laissez faire* was assumed at once to maximize self-realization on the one hand and on the other to serve the state by selecting the fittest for survival. Historic experience and biological principle seemed to the Victorian age to canonize the classic antithesis of individual and state.

The conception of an individual whose liberty was a function—the maintenance of order apart—of the weakness of the state was intelligible enough in its period. It failed to take account of the fact that the differences between men are too great under such conditions to make self-realization possible for more than a few. Liberty in a *laissez faire* society is attainable only by those who have the wealth or opportunity to purchase it; and these are always a negligible minority. Experience accordingly drove the state to interfere; and the liberal state of the nineteenth century was gradually replaced by the social service state of the twentieth. This may be described by saying that it again joins the ideal of liberty to that of equality, and this in the name of social justice. As the claims of liberty broke down the privileges of birth and creed, so with obvious logic they began an assault upon the claims of wealth also. The state was increasingly driven to widen its functions to mitigate the consequences of that social inequality to which the system of absolute liberty gave rise. Education, public health, provision against unemployment, housing, public parks and libraries are only a few of the outstanding services it was driven to organize in the interest of those who could not be expected to help themselves. Democratic agitation, which from 1600 to about 1870 had been occupied with the removal of barriers upon individual action, after 1870 began to press for the deliberate creation of equalitarian conditions. It has become clear,

in a word, that the idea of liberty depends upon the results of the social process at any given time; and it is against that background that its essential elements require analysis.

Liberty may be defined as the affirmation by an individual or group of his or its own essence. It seems to require the presence of three factors. It seeks in the first place a certain harmonious balance of personality; it requires on the negative side the absence of restraint upon the exercise of that affirmation; and it demands on the positive the organization of opportunities for the exercise of a continuous initiative. The problem of liberty has always been the prevention of those restraints, upon the one hand, that men at any given period are not prepared to tolerate and, upon the other, the organization of those opportunities the denial of which results in that sense of frustration which when widely felt leads to imminent or actual disorder.

So regarded, two things are clear about liberty. While its large outlines may have a fairly permanent character, its particular content is always changing with the conditions of time and place. To one age the demand for liberty may express itself in an insistence upon religious toleration; to another political enfranchisement may be its essential expression. This serves to remind us that liberty is always inherent in a social process and is unintelligible apart from it. Liberty therefore must always be conceived, if its philosophy is to be an adequate one, as related to law. It can never be absolute; some restraints are inevitable, some opportunities must be denied, simply because men have to live with one another and move differently to the attainment of antithetic desires. So closely moreover is this network interwoven that we cannot ever seek permanently to define a sphere of conduct within which freedom of action may be defined as liberty. For while we may claim, to take an obvious example, that there is unlikely to be liberty in any community in which there is no legal right to freedom of speech, we cannot maintain that an absolute right to say what he pleases is or should be inherent in any person; it is not, as Mr. Justice Holmes has said, a denial of freedom of speech when a man is prohibited from crying "Fire!" in a crowded theater.

Liberty, in a word, has to be reconciled with the necessities of the social process; it has to find terms upon which to live with authority. Those terms have never been absolute or unchanging; they have always been a function of the historic environment in some given time and place. And

that environment has always given birth to its own system of ideas, to which it has contributed some special emphasis in the notion of liberty, born of its peculiar conditions. That emphasis is always seeking its translation into an idea of law, whether by way of negation or affirmation; and the relation of authority to the substance of this idea is usually dependent upon what those who exercise authority consider will be the effect of the translation upon the order they seek to maintain. Trade unions demand the right to combine; authority admits that right or stigmatizes it as conspiracy, according to whether it considers the admission compatible with the way of life it seeks to uphold. A religious group demands the removal of the barriers upon the admission of its members to citizenship; the action of authority will turn upon its judgment of the consequences of the demand. Usually it will be found that the action of authority turns upon its estimate of the power possessed by those who make the demand and the way in which they will use their power; that is the truth embodied in Royer-Collard's great aphorism that liberty is the courage to resist.

The history of liberty since the Reformation has largely passed through two great periods. In the one the essence of the struggle for its realization has been to free the individual from subordination to a position, religious, political or economic, in which he has been placed by an authority external to himself. The effort has been the conferment upon him of rights—that is, of claims recognized by the law—which he is to enjoy without regard to the groups to which he may belong. This may be called the period of personal emancipation, and its classic expression is in the program of the French Revolution. The conception of society involved in it is that of an aggregate of persons; and it is argued that the fewer the restraints upon the free play of personality, the greater will be the liberty attained. Social effort is devoted to the destruction of privileges which inhere in some specially favored groups. It is generally conceived that the more men are let alone, the less positive the action of the state, the more likely is the individual to be free. In this period liberty is related to justice and equality in a negative way. My relation to my neighbor is deemed socially adequate if the state does not positively intervene to confer benefits upon him which I do not enjoy. Religious privilege, political privilege, privileges of birth or sex or race, little by little go by the board.

But in the period which roughly synchronizes with the growth of the modern proletariat it is rapidly discovered that the merely negative liberty to do what one can does not give freedom to the masses. We then enter upon the period of social emancipation. Government becomes increasingly paternalistic. It regulates the behavior of individuals and groups in the interest of an increasing complexion of equality in their lives. The size of the community tends to make the individual less and less significant. He has to obtain his liberty in concert with others similarly placed in the society to which he belongs. In this period the emphasis of liberty is predominantly in the economic sphere. Men become increasingly aware that grave inequalities in property mean grave differences in access to liberty. The struggle for freedom is largely transferred from the plane of political to that of economic rights. Men become less interested in the abstract fragment of political power an individual can secure than in the use of massed pressure of the groups to which they belong to secure an increasing share of the social product. Individualism gives way before socialism. The roots of liberty are held to be in the ownership and control of the instruments of production by the state, the latter using its power to distribute the results of its regulation with increasing approximation to equality. So long as there is inequality, it is argued, there cannot be liberty.

The historic inevitability of this evolution was seen a century ago by de Tocqueville. It is interesting to compare his insistence that the democratization of political power meant equality and that its absence would be regarded by the masses as oppression with the argument of Lord Acton that liberty and equality are antitheses. To the latter liberty was essentially an autocratic ideal; democracy destroyed individuality, which was the very pith of liberty, by seeking identity of conditions. The modern emphasis is rather toward the principle that material equality is growing inescapable and that the affirmation of personality must be effective upon an immaterial plane. It is found that doing as one likes, subject only to the demands of peace, is incompatible with either international or municipal necessities. We pass from contract to relation, as we have passed from status to contract. Men are so involved in intricate networks of relations that the place for their liberty is in a sphere where their behavior does not impinge upon that self-affirmation of others which is liberty.

In short, the problems of liberty in a plural-

istic world are extraordinarily complex. The individual who seeks self-realization finds himself confronted by a network of protective relationships which restrain him at every turn. Trade unions, professional and employers' associations, statutory controls of every kind, limit his power of choice by standardizing the manner of his effort. He has to adjust himself to an atmosphere in which there is hardly an aspect of his life not suffused at least partially with social regulation. To do anything he must be one with other men; for it is only by union with his fellows that he can hope to make an impact upon his environment. And even outside the realm in which the state defines the contours of his effort he finds himself surrounded by a complex of social customs and habits which force him despite himself into conventional modes of behavior. The scale of the great society is definitely unfavorable to the individuality of an earlier period.

One other aspect of this position is notable. The history of liberty has been the growth of a tendency to take for granted certain constituent elements in its substance. There is certainly greater religious freedom, for example, than at any previous time. But when the causes of this change are analyzed, it will be found that the growth of religious freedom is a function of the growth of religious indifference. The battle of liberty is not won but merely transferred to another portion of the field. As the contest over the place of individual property in the state becomes more sharp, the state limits freedom of expression and association in those matters which seem to it dangerous to the principles it seeks to impose. Social instability and liberty are antithetic terms. A society is tolerant when men do not challenge the foundations upon which it rests. Wherever these are in question, it moves rapidly to the conditions of dictatorship; and the elements of liberty are unattainable until a new and acceptable equilibrium has been reached.

It is therefore relatively easy to say what things go to make up liberty; it is extraordinarily difficult to say how its atmosphere can be guaranteed. Liberty can be resolved into a system of liberties: of speech, of association, of the right to share fully in political power, of religious belief, of full and undifferentiated protection by the law. But the question of giving to these separate liberties factual realization turns upon the objects to which they are devoted in any particular society at a given time. No doubt in Soviet Russia a Communist has a full sense of liberty; no doubt also he has a keen sense that

liberty is denied him in Fascist Italy. Liberty in fact always means in practise liberty within law, and law is the body of regulations enacted in a particular society for its protection. Their color for the most part depends upon its economic character. The main object of law is not the fulfilment of abstract justice but the conference of security upon a way of life which is deemed satisfactory by those who dominate the machinery of the state. Wherever my exercise of my liberty threatens this security, I shall always find that it is denied; and in an economically unequal society an effort on the part of the poor to alter in a radical way the property rights of the rich at once throws the whole scheme of liberties into jeopardy. In the last resort liberty is always a function of power.

It is no doubt true that men have endeavored to set the conditions upon which liberty depends beyond the reach of peradventure. Locke sought to do so by his conception of a limited liability state; but experience has grimly shown that in times of crisis the limits of the liability cannot be maintained. Montesquieu argued that liberty is born of the separation of powers in a state; but the truth of his argument is at bottom the very partial one that men are unlikely to be free unless the judicial authority is largely independent of executive and legislature. The constitutions of many modern states have sought to make the alterations of certain fundamentals a matter of special difficulty in order to protect the liberty of their subjects from invasion. Experience suggests that the technique is not without its value; but, as war and dictatorship have shown, it is an expedient for fair weather, always liable to fundamental neglect in times of crisis. It seemed to de Tocqueville that large local liberties were the secret of a general free atmosphere; liberty, he thought, is born of the wide distribution of power. But this appears to be true only when an equal society can take such advantage of the distribution as to make its benefits unbiased in their incidence; and in the struggle for such a society not the most unlikely thing is the rapid disappearance of this characteristic. The great idealist school of political philosophy has found the essence of freedom in obedience to the general will of the state; but it cannot be said that it has made clear, save to its own votaries, either the nature of a general will or the conditions under which a general will, if it exists, may be said to be in effective operation. An important school of modern publicists has sought to find the essential condition of lib-

erty in a supply of truthful news, since in its absence no rational judgment is possible. But it is clear that the supply of truthful news depends upon men being equally interested in the results which the impact of news may make upon opinion; and no such equal interest exists, above all in an economically unequal society.

Generally it may be argued that the existence of liberty depends upon our willingness to build the foundations of society upon the basis of rational justice and to adjust them to changing conditions in terms of reasoned discussion and not of violence. But if that be the case, the existence of liberty depends upon the attainment of a society in which men are recognized to have an equal claim upon the results of social effort and the general admission that if differences are to obtain these must be proved desirable in terms of rational justice also. In this background, as Aristotle saw at the very dawn of political science, liberty is unattainable until the passion for equality has been satisfied. For the failure to satisfy that passion in an adequate way prevents the emergence of equilibrium in the state. Its foundations are then in jeopardy because men are disputing about fundamentals. In such circumstances proscription and persecution are inevitable, since the community will lack that unified outlook upon the principles of its life of which liberty is the consequence. Men who differ upon ultimate matters, particularly in the realm of economic affairs, are rarely prepared to risk the prospect of defeat by submitting their disagreement to the arbitrament of reason. And when reason is at a discount, liberty has never had a serious prospect of survival.

LIBRARIES. See PUBLIC LIBRARIES.

LICENSING. The term license is variously used in law and government with correspondingly varied shades of connotation. Thus in liquor legislation high license was equivalent to a high license tax. Many excise taxes are levied in connection with and through the form of the licensing of some trade, occupation or use or possession of property; but if they are an important source of general revenue rather than simply a means of defraying the expense of administering the particular licensing regulation, they are more commonly spoken of as license taxes than simply as licenses or license fees. A license in the sense of a permit does not necessarily involve the idea of a fee and may be issued gratuitously.

In the law of real property a license signifies permissive use as a matter of indulgence without adverse claim of right on the part of the user or possibly, in a more technical sense, a right of occupancy that falls short of being a right in rem, being merely a claim against the owner; in the law of patent and copyright it signifies a delegation of use and exploitation on specified terms, the connotation of merely permissive use disappearing in this connection.

In the law of municipal corporations the grant by the governing body of a right to occupy streets for public utility appurtenances, such as tracks, poles, wires, pipes or tunnels, is sometimes spoken of as a license in order to distinguish it from a franchise—a term more appro-

priately used when the grant proceeds from the sovereign—and also to indicate in a somewhat vague manner that the occupancy falls short of an absolute right. It used, however, to be characteristic of this particular form of license that it was given in the form of a special legislative act of the municipal corporation; and however much in theory a competitive grant to a rival undertaking was possible, there was nothing to compel the rival grant, and so long as it was not forthcoming the grantee enjoyed a virtual monopoly. It is therefore quite customary, although perhaps legally inaccurate, to speak of these licenses as franchises.

The form of licensing to be considered here is the administrative lifting of a legislative prohibition. The primary legislative thought in licensing is not prohibition but regulation, to be made effective by the formal general denial of a right which is then made individually available by an administrative act of approval, certification, consent or permit. As a generic term certification might indeed be more appropriate than license; thus a marriage license is so termed only on account of its historical origin as a dispensation with the requirement of a publication of the banns, and when New York in 1896 abandoned the policy of discretionary powers in the control of the retail liquor trade, it dropped the term license and substituted the term liquor tax certificate.

Control through licensing means an administrative advance judgment regarding the presence of legal requirements or the absence of legal objections. It is the legislative policy and hope that law observance may thus be normally and expeditiously insured by eliminating the most obvious or serious sources of future trouble that would have to be dealt with by slower remedial processes.

The greater expedition of administrative action may be secured also without the expedient of the license by the substitution, at least provisionally, of administrative for judicial corrective processes. An administrative order may point out objectionable conditions and practises and direct that they be redressed, thus avoiding both the stigma and the hazard of penal prosecution. It is believed that this permits more elastic control than can be obtained by purely criminal legislation. Related to this method is the system of requiring notification of a proposed course of action to the administrative authorities, who are given a chance to interpose objections but whose failure to act leaves the

private party free to proceed. The Federal Trade Commission and (for a number of purposes) the Interstate Commerce Commission issue orders instead of licenses, and the English Theatre Act of 1843 gave stage censorship the form of a notification requirement subject to an administrative veto power.

The Federal Trade Commission Act, which is directed against unfair methods of competition, illustrates an advantage, from the legislative point of view, which the system of orders has over the system of licensing. It is possible to establish the former by mere reference to general categories of danger and abuse, applicable, for instance, to the entire range of public health or safety, or of interstate and foreign commerce; whereas licensing requirements must be more specific and as a method of dealing with unfair competition would present an extremely complex and difficult task of legislative selection and exemption of businesses or enterprises.

Even more important is the difference between the two systems with respect to the discretionary or non-discretionary quality of administrative action. An order based on default or defect will necessarily have a quasi-judicial aspect and will therefore neither tend, on the one hand, to become mere matter of official routine nor, on the other, be issuable as a matter of free discretion; a licensing system has the widest choice with reference to the freedom of official action.

It is possible to establish license requirements from which administrative discretion is practically eliminated. This means that the conditions entitling to the license are fully specified by the law. If the ascertainment of these conditions involves the determination of facts, the non-discretionary character of the power expresses itself in the inconclusiveness of the administrative finding, which can always be judicially controlled by a mandamus proceeding. A legislative policy opposed to discretion, however, will endeavor to prevent factual controversy by prescribing methods of proof or by basing the license upon statements rather than facts. If this is carried to the point where the official act is one of mere certification, it may become difficult to distinguish the system from a mere registration requirement. Occasionally, however, the difference will become politically important. The legislature may desire to avoid even the semblance of an official consent requirement and yet deem public notice necessary; and it attains that end by attaching to the registration a right

to an immediate receipt. In France the right to freedom of assembly was established in this way in 1881.

Discretion enters into the licensing power most commonly through the framing of requirements by the legislature in such a manner that some difference of question as to compliance or fulfillment is regarded as legitimate. Within the limits of this legitimate difference official judgment is respected; beyond it there is legally "abuse of discretion," with the possibility of judicial redress. Such terms as reasonable, adequate, reputable, suitable or safe, which involve value judgments or future probabilities and a lack of objective certainty, are characteristic.

Where as a matter of professional experience value and probability judgments are fairly standardized, discretion may be reduced to the point at which there appears to be hardly more than a question of fact; on the other hand, the range of permissible considerations and their inherent uncertainty may be such as to widen discretion to the point of substantial freedom, as where the legislative reference is to the general welfare or the public good or detriment. Ordinarily such discretion ought not to be and is not delegated where licenses are required for the exercise of private rights. It may be delegated, however, where a primary policy of prohibition is to be relaxed under conditions of emergency or of exceptional hardship; there is then a dispensing rather than a licensing power; but modern legislative practise does not favor unregulated dispensing powers.

Of special importance is the question whether administrative discretion in granting or refusing a license may take into consideration community need and adequacy of existing supply. Formerly in the United States and now in Europe these were expressly made legitimate considerations in the licensing of the retail sale of intoxicating liquors. In the United States the same considerations underlie the "certificate of convenience and necessity" authorizing new public utility undertakings. Restriction to the need of the community is tinged with monopoly; and while monopoly may be justifiable it may lead to grave abuses, such as those connected with grant of monopolistic privileges in the past. The German Industrial Code (*Reichsgewerbeordnung*) therefore takes care to specify the cases in which alone the question of need may enter into licensing discretion; and the German Insurance Law of 1901, otherwise granting wide discretionary powers, expressly excludes the consideration of

need. The recent tendency in the United States has been to recognize in this respect the inherently monopolistic character of public utilities; this character has, however, been extended but slowly to other classes of business, such as banks or savings banks, and it is extremely significant that with regard to the business of manufacturing ice the United States Supreme Court declared the requirement of a "certificate of convenience and necessity" to be inconsistent with the constitutional guaranty of liberty [New State Ice Co. v. Liebmann, 52 S. Ct. 371 (1932)].

A discretionary licensing power is very much widened if the grant of the license may be burdened with conditions to be observed by the licensee. According to the better opinion this may not be done without express legislative authority. If the law is explicit as to power but also specifies the permissible conditions, the delegation of discretion is at least definitely circumscribed. But if the grant of power to attach conditions is unqualified, the only limitation is the one implied by law, that the condition must relate to matters within the general jurisdiction of the licensing authority and within the scope of the subject matter regulated [Ann Arbor R. Co. v. U. S., 281 U. S. 658 (1930)], and the result is a licensing discretion of extraordinary extent, permitting the laying down of rules not merely not expressed in the statute book but also varying from case to case. This power to impose conditions is a conspicuous feature accompanying some of the most important licensing requirements introduced by the Transportation Act of 1920. While it is difficult to foresee all its implications, its development will be watched with great interest; and it is fortunate in this respect that the reasoned decisions of the Interstate Commerce Commission will permit the tracing of the principles upon which the power purports to be exercised.

The question of the authorities to be vested with licensing powers can be answered only by a survey of the entire problem of administrative organization, for the power is apt to be reserved to the organ having principal charge of the subject matter of regulation, if not to the head of the administration. In England certain licensing powers continue to be exercised by justices of the peace, who were originally in many respects the principal local authority; the function is elsewhere not generally regarded as appropriate for either courts or judges. The German Industrial Code prescribes (sect. 21) that in the matter of licenses for noxious trades either the original

decision or the decision on appeal must be made by a board; but neither in England nor in the United States is there any clear evidence of a similar policy in favor of boards or commissions, and in the United States many important licensing powers are vested in heads of departments.

Procedural provisions of licensing laws serve the purpose either of safeguarding the public interest or of preventing injustice to the applicant. The former is the more important and is achieved principally through prescribed forms of applications and notice requirements. As a matter of principle the applicant himself is equitably entitled to fair consideration; but since through his application he has automatically a chance to present his case and since he has also a common law remedy of mandamus in case of arbitrary refusal, the occasional failure of the licensing statute to make provision for hearing presents no constitutional question. On the other hand, the Transportation Act of 1920 requires in a number of important cases that applications for permits or certificates shall be acted upon only after a hearing, and this is judicially interpreted as meaning that grant or refusal, as the case may be, must be supported by record evidence. A discretion that would otherwise be judicially uncontrollable by reason of the latitude of permissible considerations may in this way be tied to factual substantiation reviewable by a court [Chicago Junction Case, 264 U. S. 258 (1924)].

Where a license relates to some pursuit or activity extending over a period of time, the question of its revocability becomes important. There is no general common law or statutory rule that makes any license whatever revocable for cause; if the particular licensing statute is silent, the license is irrevocable. It is impossible to generalize upon legislative policy in this respect, save perhaps in Germany, where the Industrial Code (sect. 143) forbids revocation except in cases specified by federal law. The English liquor licensing act, in many respects a model, is extremely conservative in this matter; the licensing powers introduced by the United States Transportation Act of 1920 are unaccompanied by powers of revocation; New York pursues different policies with regard to banking and to insurance; Illinois has standardized the revocation of all professional licenses. Perhaps the observation may be hazarded that the present American tendency is to make professional or occupational licenses revocable for cause (but not at pleasure), that if causes are specified they

may include default or delinquency not amounting to crime, and that revocation is more commonly administrative than judicial, under elementary procedural safeguards and subject to judicial review upon common law principles.

Time limits on the grant of a license serve in a measure as a substitute for a power of revocation and have occasionally been urged with that object in view. In addition to those cases where the nature of the subject matter makes temporary licenses appropriate the practise is possible in connection with trades, occupations and professions. Unless there is practical assurance of renewal, preferably with special legal facilities for that purpose, a brief license tenure will not aid the morale of the occupation. German legislation is for this reason definitely opposed to time limits, but they are quite common in England and the United States.

Toward the middle of the nineteenth century it was possible to discern in the course of legislation a tendency hostile to the multiplication of license requirements: by the constitution of 1846 New York had abrogated its inspection law, which had started at an early period in the history of the state as measures for certifying commodities and had apparently degenerated into a mere method of fee exactions; the Prussian law of 1845 had inaugurated the principle of freedom of vocation, which was later carried into the German Industrial Code of 1869; England was dominated by ideas of *laissez faire*, which still survive in the absence of license requirements for banking and insurance; and American federal regulation was as yet confined to water borne commerce.

The German Industrial Code, first enacted at the height of the era of economic freedom, leaves positive licensing legislation to the states but establishes nationally operative principles as to what businesses may be subjected to license requirements. This comes quite close to establishing a constitutional status of freedom, but the act leaves outside of its scope very important fields of activity (the practise of law, education, insurance, mining, railway transportation). The main consideration in favor of licensability appears to be the possible tendency of a business to degenerate into a nuisance or its traditional connection with fraud or immorality; but without careful analysis any summary must be somewhat misleading. There is nothing in England or the United States comparable to this comprehensive legislative view. In the latter country sporadic decisions declaring a constitutional

right to exemption from license requirements (plumbers in Washington, accountants in Illinois) proceed on no clear theory, and it is easier to recognize a sphere of practical and customary than one of constitutional freedom.

In the United States the former qualification tests for crafts have largely disappeared, and common labor and employment (except of seamen and occasionally of miners) have become free and unchecked; certification systems are adopted where they are indispensable to the operation of a prohibitory policy, as in connection with child labor, but they would be repudiated, for example, as a means of making the restriction of hours of labor of females more effective. Commercial and industrial enterprise as such has remained notably free, and it is particularly significant that corporate facilities are no longer regarded as matter of licensing but virtually as merely matter of registration. Science, art and literature are generally free and the constitutional freedom of the press prevents the licensing of publications, just as religious freedom forbids qualification requirements for ministers. The freedom of art does not extend to public amusements; and although there is no censorship of the stage through licensing requirements, there is such censorship of moving pictures. There are systems of certifying public but not private teachers; educational institutions are free in most of the American states. Licensing requirements now generally apply to public utilities, banking, insurance and the professions. Where a particular service aspires toward a professional status, the pressure for qualification requirements and therefore for licensing comes from within, as in the case of realtors, accountants, nurses and social workers; in the case of dealers in securities and perhaps of insurance agents it seems to come from outside. Often the movement begins with certification facilities or designation privileges; the optional then tends to transform itself into a compulsory system.

Where safety, health and morals are involved, where private activities trench upon the conservation of public resources or where nationalistic interests are to be safeguarded, the license always suggests itself as a ready means of making regulation more effective, if only as a temporary measure pending the discovery of substantial principles of regulation.

Although general statements of tendency are hazardous, there seems to be evident at present a trend toward better safeguarding of the methods of licensing. This is manifested in part in a

reduction or elimination of the discretionary factor, in part in an increasing attention to organization procedure and review. Where some particular branch of regulation has a long legislative history, where interests subject to regulation are strongly intrenched or where a licensing policy is politically contested, considerable attention is likely to be given to administrative detail, whereas unqualified powers are apt to accompany an unclarified legislative policy; the minutiae of regulation in the English Licensing (Consolidation) Act of 1910 contrast in this respect with the few words of the English Petroleum Act of 1918.

As compared with the nineteenth century the present is an era of intensive governmental regulation. Even without a disposition to enhance official powers, perhaps notwithstanding a strong feeling against bureaucratic government, there are many fields in which administrative intervention and even administrative discretion are indispensable. The choice in these fields lies between administrative orders and administrative licenses. The former probably represent a more conservative exercise of public power; but with the burden of initiative thrown upon the government, the check is likely to be sporadic and confined to exceptional cases. A licensing system is the path of least resistance; it lends itself equally to wide discretion and to non-discretion, and private interests are usually able to accommodate themselves to it without undue difficulty. It is so convenient a method of checking the observance of governmental regulations that its permanence in the economy of legislation and administration appears to be assured; but the elaboration of administrative detail with a view to the most effective reconciliation of public and private interest will necessarily be a matter of prolonged experimentation.

LIEBEN, RICHARD (1842-1919), Austrian economist. Lieben studied at the polytechnic schools of Vienna and Karlsruhe and afterwards entered the banking house of Auspitz, Lieben and Company in Vienna. He was vice president of the Handels-Akademie and of the court of arbitration of the exchange. During the inquiry concerning the reform of the Austrian currency in 1892 Lieben advocated the adoption of the gold standard and argued convincingly that the ratio of the old silver currency to the new gold currency be determined according to the market value prevailing at the introduction of the new currency.

Lieben's most important contribution was his collaboration with Auspitz in their work *Untersuchungen über die Theorie des Preises* (Leipzig 1889). This outstanding contribution to mathematical economics presents a unified treatment of price as the central problem of economic theory; wages, rent and interest are treated as particular aspects of the general price problem. Starting from the concept of marginal utility the authors give an original graphic exposition of utility and cost curves and their respective derivatives—demand and supply curves—and arrive at the theory of general equilibrium. The analysis is pursued under the assumption both of stable and of variable estimations of the value of money. In the French translation of the *Untersuchungen* (*Recherches sur la théorie du prix*, 2 vols., Paris 1914) Lieben revised the theory which he had formerly held and defended against the criticism of Walras, that the supply and demand curves of a particular commodity can meet only at a single point.

LIEBER, FRANCIS (1800-72), German-American political philosopher and publicist. Born in Berlin, Lieber served two terms in German prisons for his liberal activities and in 1827 emigrated to the United States. He entered actively into the cultural and political life of America. He compiled the *Encyclopaedia Americana* (13 vols., Philadelphia 1829-33), based in general upon Brockhaus' *Conversations-Lexikon*. From 1835 to 1856 he served as professor of history and political economy at South Carolina College and afterwards at Columbia University as professor of history and political science (1857-65) and professor of constitutional history and public law (1865-72). He was a thoroughgoing American nationalist: his numerous theoretical writings, notably the *Manual of Political Ethics* and *Civil Liberty and Self-Government*, supplied a philosophical basis for a policy of national supremacy in the federal union. He took the principal part in the work of a commission appointed by President Lincoln in 1862 to prepare a code of rules for the armies of the United States. Promulgated in April, 1863, as "Instructions for the Government of the Armies of the United States in the Field" (United States, Adjutant General's Office, *General Orders*, no. 100), this code has been accepted as the basis of subsequent American and European codifications of rules for warfare on land. As a political theorist Lieber repudiated the doctrine of social contract and rejected also "natural rights" in the sense of liberties retained from a prepolitical "state of nature." A nation he defined as a people made spontaneously co-operative by a common language and cultural tradition and by a common territorial habitation. In a somewhat vague theory he interpreted political sovereignty as an authority naturally inherent in a nation, manifested in a national public opinion and "the source of all other political authority" yet restrained in its actual power by a balanced distribution of functions among central governing agencies, by a concession of wide powers of self-government to local bodies and by the maintenance of an independent judiciary sustaining "natural" rights—rights, that is, which are essential to the normal development of man

in society and which receive persistent recognition in the traditional institutions and guarantees of a "common law." Lieber showed no striking originality in his political theory, and his style is somewhat prolix; but the comprehensive and systematic form of his writings and their breadth of philosophical and historical vision gave them great influence upon later American theorists, notably Theodore D. Woolsey and John W. Burgess.

LIEBERMANN, AARON SAMUEL (c. 1840-80), Jewish socialist. Liebermann was born near Grodno. After an orthodox religious education and thorough training in Hebrew and the Talmud, in 1869 he entered the Technological Institute in St. Petersburg. In 1874 he led a revolutionary agitation in Vilna; pursued by the police he fled to London, where he founded a Jewish section of the Russian Social Revolutionary party and in 1876 the first Jewish trade union. He then moved to Vienna, where in 1877 he edited *Ha'emet* (The truth), the first Jewish socialist periodical in the Hebrew tongue. After serving prison sentences in Austria and Prussia he emigrated to the United States.

Liebermann was one of the first to discern the beginnings of class differentiation in the Jewish masses of the 1870's and to perceive the need and possibility of forming independent Jewish socialist organizations within the major socialist movements of the various countries. He was inspired by Lavrov's call to the Russian intelligentsia to go to the people and he called upon the Jewish intellectuals to bring the message of socialism to the Jewish masses. Keenly appreciative of the cultural values of the Jewish heritage, he combined his socialist ideal with the ideal of

Jewish national regeneration and the revival of the Hebrew language. Although Liebermann's activity was short lived and its immediate effect but slight, his work was significant because of its influence on the subsequent Jewish socialist movement.

L., "Die ersten Sozialisten in der hebräischen Literatur" in *Jude*, vol. iii (1918-19) 394-404; Burgin, H., *Die geschichte fun der yiddisher arbeiter-bavegung* (in Yiddish) (New York 1915) p. 22-27, 36-43.

LIEBERMANN, FELIX (1851-1925), German historian, legal scholar and philologist. Liebermann was born in Berlin and was the son of a prominent Jewish textile manufacturer. In 1869 after completing his studies at the Werder Gymnasium in Berlin he spent nearly four years in business. He visited England, where he became proficient in the English tongue and acquired a keen interest in English institutional history. Since his main intellectual interests already lay in the direction of Germanic history and institutions he decided to forsake business for the life of a scholar. After attending lectures by Mommsen and Droysen at Berlin he continued his Germanic studies at Göttingen under Waitz, Pauli and Frensdorff, and there he learned also the rudiments of palaeography and laid the foundations of a broad culture. In 1875 he published as his doctoral dissertation at Göttingen the remarkable *Einleitung in den Dialogus de Scaccario* (Göttingen 1875), a work in which he gave abundant evidence of his exceptional powers as a textual critic and historian. Thereafter his chief interests in scholarship were centered in the English aspects of the history of Germanic laws and institutions; he became universally recognized as one of the most eminent mediaevalists and in particular as the foremost authority on the laws of the Anglo-Saxons and the legal literature of the Norman period of English history.

Liebermann was for a time on the editorial committee of the *Monumenta Germaniae historica* and prepared two volumes himself for the series. In numerous writings, which appeared from 1892 to 1901, he restored the law books of the Norman age; by his editions of contemporary treatises on Normanized Anglo-Saxon law he il-

luminated important aspects of the law of post-Conquest times; and from Anglo-Norman texts based on Anglo-Saxon sources he recovered much of the early English law before it had been subjected to Norman influence. Liebermann's most important work is *Die Gesetze der Angelsachsen* (3 vols., Halle 1903-16), which engaged most of his time for nearly thirty years. It was prepared at the request of the Savigny-Stiftung für Rechtsgeschichte, with the support of Konrad von Maurer and Heinrich Brunner. The work consists of a careful edition of the Anglo-Saxon laws, translation into German of all the original texts, a dictionary of the words used in the text, a glossary of the subject matter and introductions and explanatory notes to all the texts. The importance of this monumental work is that it established a text of the sources in keeping with the critical standards of modern times and provided a scholarly apparatus for the illumination of the text. While it has not entirely displaced some of the earlier editions of the Anglo-Saxon laws, notably Reinhold Schmid's *Gesetze der Angelsachsen* (Leipsic 1832, 2nd ed. 1858), it is nevertheless rightly regarded by scholars as one of the most important of all source books for the study of early English laws and institutions and within the field it covers as an indispensable guide in research. In addition to the works already mentioned Liebermann published many valuable articles and essays dealing with aspects of mediaeval history, especially the legal and institutional history of England.

LIEBIG, FREIHERR JUSTUS VON (1803-73), German chemist, pioneer in the application of chemistry to agriculture. After preliminary studies in natural science at Bonn and Erlangen Liebig went to Paris in 1822. There he made the friendship of Alexander von Humboldt, who introduced him to the laboratory of Gay-Lussac and later helped him to secure a professorship at the University of Giessen. He immediately established a laboratory to provide practical instruction, and through his effective presentation of the results of his investigation he soon made

Giessen the center of German chemical teaching and research. A large number of European and American students, who were to become world famous theoretical and applied chemists, received their training under his direction.

Liebig's interest in the application of chemistry to agriculture grew directly out of his theoretical work in organic chemistry, which demonstrated that so-called organic products can be created in the laboratory out of inorganic substances. In 1840 he made his report to the British Association for the Advancement of Science on organic chemistry and its applications to agriculture and physiology. In this treatise, revised and improved by him in numerous editions during his lifetime, he attacked the prevailing humus theory of plant growth, which held that plants derive all their nourishment from the decayed organic matter in the soil, and maintained that plants derive their carbon and nitrogen from the carbon dioxide and ammonia in the atmosphere while their other food elements, such as potassium, phosphorus, lime and soda, come ultimately from the minerals in the soil. These must be periodically replenished if fertility is to be maintained. He further developed the principle, later formulated as the Law of the Minimum, that "by the deficiency or absence of *one* necessary constituent, all the others being present, the soil is rendered barren for all those crops to the life of which *that one constituent* is indispensable." The determination of the indispensable elements for a given crop is obtainable through the analysis of the ash content of that plant, thus putting the whole problem of fertilizer on a quantitative scientific basis. For many years Liebig conducted practical experiments to determine the best methods for applying mineral fertilizer to the soils. Originally he applied the fertilizer in insoluble form, fearing that it would otherwise be washed away by rain; later he recognized his mistake and found that the soil itself has a capacity for absorbing and holding soluble minerals.

It is not to Liebig's discredit that his theories concerning plant nitrogen were later proved erroneous; investigations in the 1880's demonstrated that leguminous plants alone have the capacity of fixating nitrogen from the atmosphere. All other plants depend for their nitrogen supply on plant or animal fertilizer or on chemicals derived either from such sources or (since the beginning of the twentieth century) from electrical synthesis of atmospheric nitrogen. Leguminous plants, however, may be grown

without a nitrogen supply in the soil or may be used to enrich the soil for other crops by being plowed in as green manure. Subsequent research has also shown that Liebig's emphasis on artificial manures underestimated the importance of natural fertilizers, which serve to improve the texture of the soil and to conserve its moisture.

Without disparaging the work of other chemists who worked in this field—Boussingault in France and Lawes and Gilbert in England—Liebig may be regarded as the real founder of modern agricultural chemistry; more than any other he is responsible for the revolution in agriculture created by the use of artificial fertilizers.

H., "On Agricultural Chemistry, Especially in Relation to the Mineral Theory of Baron Liebig," and "On Some Points Connected with Agricultural Chemistry" in Royal Agricultural Society of England, *Journal*, vol. xii (1851) 1-40, and vol. xvi (1855) 411-502.

LIEBKNECHT, KARL (1871-1919), German socialist leader. Karl Liebknecht, whose father Wilhelm Liebknecht was one of the founders and recognized leaders of the German Social Democratic movement, was an outstanding representative of left wing socialism. A lawyer by profession, in 1908 he became a member of the Prussian Chamber of Deputies and in 1912 a member of the German Reichstag, and he engaged actively in the struggle for more militant party tactics. He particularly opposed German

militarism; this opposition, which he linked up with the demand for a more revolutionary socialist policy, met with much sympathy, especially among the socialist youth organizations.

At the outbreak of the World War Liebknecht was one of the few in the Social Democratic Reichstag delegation who were opposed to the war and to the granting of war credits. At the caucus on August 4, 1914, however, he yielded to party discipline and voted for the credits. In December, 1914, he voted as the only Social Democratic deputy against the new demand for credit, an act which acquired world significance and strengthened the antiwar minority in the socialist International. Together with Rosa Luxemburg he founded the Spartakusbund, which condemned the official socialist support of the war and proclaimed, at first only within the Social Democratic party and then directly among the masses as well, the revolutionary struggle against the German government and its policy. In order to suppress Liebknecht's activities the government called him to military service, but in 1916 he took part as an active soldier in an antiwar street demonstration in Berlin. He was arrested and sentenced by a war tribunal to four years' imprisonment, which won him much sympathy as a martyr to the cause of peace and workers' freedom even beyond the circle of the Spartakusbund. In October, 1918, he was liberated by an amnesty.

While it was Liebknecht who struck the first blows for liberty on behalf of the revolutionary workers of Germany, the November revolution of 1918 not only took place without his assistance but was in fact guided by forces foreign to his ideas; thus from the very first Liebknecht came into sharp opposition to the new German socialist-republican government. He advocated alliance with the Russian Bolsheviks, although, like Rosa Luxemburg, he did not approve of their theory and practise in important details. In December, 1918, the Spartakusbund became the Communist party of Germany. Liebknecht had no illusion that the greater part of the German people was ready for a communist revolution and therefore urged a preparatory campaign of agitation and organization. When, however, an uprising of revolutionary workers broke out in January, 1919, both Liebknecht and Rosa Luxemburg threw in their lot with the combatants. After the suppression of the January uprising by the socialist-republican government Liebknecht was murdered by a group of monarchist officers. He was essentially an agitator and organizer, not

a theorist; his significance lies in the practical role which he played at a critical moment in the development of the German socialist movement.

ARTHUR ROSENBERG

LIEBKNECHT, WILHELM (1826-1900), German socialist leader. The Liebknecht family was one of scholars and state officials related to Luther. Liebknecht studied theology, philosophy and philology at the universities of Giessen and Berlin, from which he was dismissed on account of his socialist and Polish sympathies. He took part in the German Revolution of 1848 and after its collapse found an asylum in London, where he lived as newspaper correspondent and teacher until 1862.

In London Liebknecht associated with Karl Marx, by whom he was greatly influenced but with whom also he already disagreed on many fundamental issues. He was not a consistent Marxist; his democratic ideology clashed with the Marxist conception of class struggle and revolutionary dictatorship. He remained essentially a Forty-Eighter, striving for a *Germania magna* gathering all her children into a united commonwealth governed by the principles of human freedom and social justice. Liebknecht passionately abhorred Bismarckian statecraft. In 1862 he joined the editorial staff of the Berlin *Norddeutsche allgemeine Zeitung*, but as soon as he became aware that it was in the service of Bismarck he resigned his position. The government took its revenge and expelled him from Prussia, whereupon he removed in 1865 to Leipzig, won August Bebel for socialism and helped to organize the democratic-socialist elements into the Eisenach party in opposition to the Lassallean General Workers' Union, which be-

tween 1867 and 1870 favored Prussian policy. As member of the Reichstag in 1870 he fearlessly opposed the war with France and together with Bebel voted against the military appropriations. Later in a pamphlet *Die Emser Depesche* (Nuremberg 1891, 7th ed. 1899) he revealed to the world Bismarck's falsification of the Ems dispatch (July, 1870), which precipitated the Franco-Prussian War. In 1893 Bismarck acknowledged Liebknecht's critical acumen by publicly admitting that he had "altered the Ems dispatch from a *chamade* into a *fanfare*." For his international, pacifist attitude Liebknecht was charged in 1872 at Leipsic with high treason and sentenced to two years' detention in a fortress. His speeches at the trial were instinct with courage and eloquence; he transformed the court into a platform for socialist agitation.

Except in the years 1868 and 1869, during which he sometimes expressed social revolutionary ideas, Liebknecht worked to the end of his life for peaceful social reform and democratic institutions. After the unification of the Eisenach party with the Lassalleans at Gotha in 1875 he was among the leaders who drew upon themselves Marx' sharp criticism of the Gotha program as an abandonment of revolutionary objectives and tactics. In the period 1898-1900 he fought against the revisionism of Eduard Bernstein and others who wished to adapt the revolutionary theory of the party to its moderate social reform practises; he adopted the official centrist position of the party. At the age of seventy Liebknecht went to prison for four months on a charge of quasi-lese majesty. He edited the leading party paper, *Vorwärts*, played an important role in party life during the period of Bismarck's antisocialist laws and profoundly influenced German socialist journalism; his articles served as models to a generation of working class writers.

LIEN. The term lien is generally used in Anglo-American law to describe any jural privilege which secures a debt against an owner's specific property. The historic common law lien was a possessory lien on personal property; that is, the lienor had the privilege of retaining the possession of the debtor's property until the former's claim with respect to that particular property had been satisfied. Possession was the essential characteristic of the relationship, because if the lienor gave up his possession he lost his privilege. On the other hand, the debtor's title to the property, although divorced from its possession, was unimpaired, because the lienor could not by sale or otherwise affect the debtor's title.

A lien is to be distinguished from a pledge, by which possession but not title is transferred, because a pledge carries with it a power of sale over the property. A lien is also to be distinguished from a mortgage (until recently only of real property), by which title but not possession is transferred by what purports to be a conveyance to the creditor, subject to a provision calling for a reconveyance to the debtor if the debt is paid by a certain day. A lien is entirely distinct from the debt or obligation which it secures. It is only a remedy to compel payment, so that unless the debt is paid the extinguishment of the lien does not affect the existence of the debt. A lien is of course extinguished by payment or by tender of payment. As Salmond well puts it, the lien is a shadow cast by the debt upon the property of the debtor.

Historically the common law possessory lien arose apparently out of the lien which the owner of land had for the keep of cattle which had strayed on to the land. Such a lien existed as early as 1371. A lien was then recognized in the case of personal property in the possession of innkeepers and next of common carriers, as a corollary to the obligatory duty of both these classes to serve the general public. By the late fifteenth century usage had extended the protection of the lien to tailors and other persons who had worked on chattels. Ultimately it was held that mechanics, artisans and tradesmen generally were entitled to the benefit of a lien. The early doctrine ultimately developed into the general rule that whenever property was delivered by the owner to another for a special purpose, it might be retained by the latter until the

particular debt thereby incurred was discharged.

Beside this common law lien there grew up another type of possessory lien, called the general lien, by which all the property of the debtor in the possession of a lienor was retained to secure general indebtedness due on a general account. The courts have always viewed this general lien with distrust, and it has not been widely extended. The liens which have been enforced most frequently are those of lawyers, banks and stockbrokers, all of relatively recent origin. In furtherance of commercial transactions it has also become established that special or general liens can be created by the express agreement of the parties where they would otherwise not exist.

The extension of common law liens by contractual agreement coincided with the development of equitable doctrines and the creation of the equitable lien in certain types of cases, so that contractual or quasi-contractual obligations could be enforced by a remedy directly against the specific property or its proceeds: in contracts relating to specific property where one party had performed or stood ready to perform his part of an agreement; in quasi-contracts where money or property had been unlawfully obtained, it or its proceeds being traceable and being in the hands of those who were not able to claim in good faith to retain it. In these types of cases courts of equity in order to enforce the obligations more effectually than by granting merely a pecuniary remedy of damages, as at common law, have treated the relationship as creating a charge upon or hypothecation of the particular thing. An equitable lien is therefore a kind of charge or encumbrance on specific property or its proceeds to secure the payment of an obligation directly connected with that property. It will at once be seen that the equitable lien has wholly departed from the necessity for possession inherent in the common law lien. The earliest equitable lien appears to have been that of an unpaid vendor of land, which was recognized at least by the late fifteenth century.

The maritime lien is still another type of lien and resembles in some respects both the equitable lien and the hypothec of the civil law. Possession of a vessel is hardly ever necessary for the creation of maritime liens, which arise from tort relations, such as collisions, as well as from such contract or quasi-contract relations as seamen's wages, salvage, bottomry and the supply of necessities. Maritime liens adhere to a vessel even in the hands of an innocent purchaser and upon the theory of the preserva-

tion of the res outrank one another inversely from the date of original creation, contrary to all other kinds of liens.

The chief defect of the common law lien was that the mere right of retention was not coupled with a power of sale. This defect was not remedied in England until well into the nineteenth century and then by statute only in a few cases where there was a duty to serve the public—thus in the cases of innkeepers, wharfingers and railroad companies [Innkeepers Act, (1878) 41 & 42 Vict., c. 38, sect. 1; Merchant Shipping Act, (1894) 57 & 58 Vict., c. 60, sects. 497-98; Railways Clauses Consolidation Act, (1845) 8 & 9 Vict., c. 20].

In the United States the right of sale has been conferred more generally and many new types of liens have been created by statute. The state of New York, possessing large rural as well as large urban interests, may be chosen as typical. Apart from mechanics' liens, its statutes provide for liens either with reference to certain things or in favor of certain types of persons as follows: vessels; monuments, gravestones and cemetery structures; labor on stone; artisans for work on personal property; hotel, apartment hotel, inn, boarding or lodging house keepers; factors; bailees of animals; bailees of motor vehicles or motor cycles; manufacturers and throwsters of silk goods; work on watches, clocks and jewelry; truckmen and draymen; motion picture film laboratories; chattel mortgages on stocks of merchandise and on canal craft; United States government internal revenue taxes. A simple and fair method is provided for the enforcement of all liens by sale of the property at public auction, which must be advertised; previous notice must be given to the debtor, who is afforded an opportunity to redeem his property. The statutory right of sale has in effect transformed the common law lien into a statutory pledge.

Where more than one lien exists, that which is prior in time generally prevails. A prior equitable lien is superior to a subsequent legal lien by judgment. A common law lien, however, is superior to all other rights in the property, while on the contrary a statutory or contractual lien is subordinate to all prior existing rights in the property. Equitable liens are assignable, so much so that an assignment of the debt carries the lien with it as a necessary incident; but common law and statutory liens are generally considered to be merely a personal privilege and so not assignable; in a few states they may be

assigned if the property is simultaneously delivered to the assignee.

Legal privileges analogous to the lien exist in continental countries either by way of so-called rights of retention or by way of preferences which in effect create implied hypothecs; that is, rights of pledge, arising by operation of law. The presence of the former in continental legal systems may be ascribed primarily to their development in German common law doctrine, which thus again showed the influence of the Germanic emphasis upon possession. The preferences of the continental law may be traced to the Roman law of implied hypothec, which might extend either to all or to some particular part of the property of a debtor. It seems, however, that in the later Roman law the *exceptio doli generalis* in effect secured rights of retention, since it was available against claims the assertion of which for some reason would have been unequitable.

The French Civil Code shows plainly the influence of the Roman law. Its system is primarily one of preferences or implied hypothecs. A preference is defined by the code as "a right which the nature of the claim gives to a creditor to be preferred to other creditors, even mortgagees" (§2095). Such preferences are general, applying to all of a debtor's property, when the claim is for funeral expenses, expenses of the last illness, servants' wages for the previous and the current year and the like (§2101); or particular, applying only to specified objects of personal property, as, for example, to a thing for expenses incurred in keeping it in repair, to the effects of a traveler for board furnished by an innkeeper or to a thing carried for expenses of carriage (§2102). Pure rights of retention exist in favor of unpaid vendors (Civ. §§1612, 1613), innkeepers and carriers (Civ. §§1782, 1948, 1952) which are essentially similar to the common law liens but which are exceptional in the general legal scheme of France. Other privileges are created by the Code of Commerce for the charges of factors (§95); for freight (§§307, 308); and for maritime claims generally (§191), in which case the lien is on the ship.

The German Civil Code recognizes a general right of retention subject to *Konnexität*; that is, to some connection between claims (§273). In certain cases, however, a right of retention is expressly negatived. Ordinarily there is no right of sale, but this exists in particular cases where the code adds a right to pledge; thus in the case of lessors and lessees, contractors, and inn-

keepers under certain circumstances (§§559, 585, 590, 647, 704). The German Code of Commerce of 1897, effective 1900, lays further emphasis on possession and provides that every merchant, including by definition bankers, carriers, factors, warehousemen, brokers, booksellers, publishers and manufacturers (§1), shall have the right to retain by agreement the possession of personal property to secure an existing indebtedness arising out of bilateral mercantile transactions (§369) or in the case of bankruptcy an unmatured indebtedness (§370). The right is enforced by sale as if there were a pledge (§371). In addition factors have a similar right of retention for their commissions, expenses and advances (§§397, 398, 410, 411), as have warehousemen for warehousing charges (§421) and carriers for carriage (§§440, 441); these rights of pledge subsist as long as possession is retained of a bill of lading, carrier's receipt or warehouse receipt; where there are several rights of pledge, the latest creditor in point of time is preferred (§443). The German maritime law provides the usual privileges for maritime transactions, most of which do not contemplate or require a retention of possession. The Swiss Civil Code of 1907, effective 1912 (there is no separate Swiss commercial code) provides for rights of retention (§§895-898) when a creditor is in possession of movable chattels or securities. The creditor, however, is also given a right of sale, after previous notice to the debtor to meet the obligation. Under the Swiss code there are no privileges apart from possession as under the French code.

The mechanic's lien is an American invention which may be ascribed to democratic sympathies with the rights of labor, although the first mechanic's lien law, which was enacted by Maryland in 1791, was intended primarily to spur the building of the national capital at Washington. The next mechanic's lien law was passed in Pennsylvania in 1803. The early laws were sometimes highly local—New York's first "lien law" of 1830 applied only to New York City. The special recognition of a mechanic's lien was necessary because of the legal and practical difficulties inherent in the distinction made between real and personal property. It was expensive and troublesome for a workman to collect for materials supplied in building, which were considered to become part of the real property when attached, and for labor expended thereon. A further difficulty often arose from the fact that the workman's only claim was against a contractor and not directly

against the landowner. By the modern statutes contractors, subcontractors, laborers and materialmen have generally been given liens directly against the land and buildings improved. In their operation, however, such statutory liens are more like the equitable lien, since the property is not in the possession of the workman. Usually a notice of lien must be filed, and within a specified time thereafter an action must be commenced to enforce the lien; the action is very much like one to foreclose a mortgage. Likewise execution issues primarily against the real property, and if it is insufficient to satisfy the judgment there may be a further judgment for the deficiency against the person contractually liable.

Mechanics' lien laws have spread not only from state to state in the United States but across the American frontier into the Canadian provinces. In England there is no exact equivalent to the mechanic's lien, but the Preferential Payments in Bankruptcy Act of 1888 gives a preference to ordinary laborers and workmen for two months' wages, but not exceeding £25; to general wages and salaries for four months, but not exceeding £50; and to agricultural laborers hired on a lump sum annual basis for claims not exceeding one year's wages.

In France §2103 and §2110 of the Civil Code create a privilege against real property, subject to certain formalities of registration, in favor of architects, contractors, masons and other workmen who have erected, reconstructed or repaired buildings and those who have furnished the money to pay them; this privilege, however, is of limited value because it is restricted to the additional value of the property resulting from the work performed. In Germany §648 of the Civil Code creates a privilege in favor of a contractor, who can require a cautionary hypothec (cf. §§1184, 1185) either when the work is performed or from time to time as it progresses. By the provisions of the *Bauforderungsicherungsgesetz* of June 1, 1909, this privilege was vastly better implemented and extended to workmen. By the Swiss Civil Code of 1912 workmen and contractors are given a statutory mortgage on the property which their labor and materials have improved. This right cannot be renounced in advance (§837). A public record is kept and entry on it, which is required, can be made up to three months after the completion of the work (§839). Several of such mortgages on the same property rank equally, as there is no priority in time (§840); any prior general mort-

gagee who knowingly has permitted the property to be overmortgaged must compensate the workmen, out of the value of the buildings, to the extent of the excess of his mortgage if the workmen suffer any loss on foreclosing (§841). The Swiss practise is thus very similar to the American.

The lien has survived in modern law as a legalized species of self-protection. It is the special safeguard of small claims. To establish the ideal relationship it is necessary to adjust various considerations. To leave the full legal and equitable ownership in the debtor and to permit him also to retain possession may facilitate fraud by making possible a sale to innocent purchasers or the obtaining of unwarranted credit on the basis of the debtor's fictitious appearance of wealth. On the other hand, if the small lienor has to employ much legal procedure to obtain the property in order to satisfy the debt, the resulting expense renders his lien worthless as a practical matter. Secret liens are obviously unfair. Public recording alone is not satisfactory, because so far as small claims are concerned it is derisory to require a search through public records, although this answers well enough when claims are large. Wherever the nature of the property permits, the ends of justice would seem to be best served by a possessory lien coupled with a power of sale.

LIETZ, HERMANN (1868-1919), German educator. After studying theology and philosophy at Jena Lietz worked under Rein in the practise school at Jena and taught for a year in Cecil Reddie's school, Abbotsholme, England. His ideas were much influenced by Rousseau, Pestalozzi, Jean Paul and Goethe. The son of a rich peasant and a peasant himself all his life, Lietz felt urban school life, classroom immobility and rigidity of schedules, hours and examinations to be psychologically harmful to children. He attacked the old Prussian schools, all very military in tone, offering instead an educational program designed to benefit both body and mind. In 1898 he founded at Ilsenburg the first German *Landerziehungsheim*, later reserved for children from eight to twelve, where play was made the center of all educational activities. In 1901 he founded a second one in Thuringia for boys from twelve to sixteen, where manual training, agriculture, carpentry and farm work were the central studies. In 1904 he established a third near Fulda for young men from sixteen to twenty; it was devoted to science and art, but play and manual work were part of the educational program. Shortly before the World War drew him into the army Lietz founded the *Landwaisenheim* at Veckenstedt. In all these schools

there were many free pupils. The system of schools was supplemented by an advisory organization of pupils' parents and a yearbook and magazine devoted to discussions of school questions. This pioneer work in establishing rural education centers developed especially in Wickersdorf and Odenwald, but the centers established there broke violently with Lietz in 1906. Nearly 150 schools adopted the name *Landerziehungsheim* before the International Bureau of New Schools in Geneva defined the term by thirty criteria. A foundation took over the schools Lietz established and added others; in 1931 six were in existence. More important, state schools have adopted many reforms initiated by Lietz, and his ideas have influenced the German youth movement.

LIFE EXTENSION MOVEMENT. The desire to prolong life and to recapture youth and health is as old as the human race. Priests, physicians, alchemists and magicians have sought and sold elixirs of life. Paracelsus in the sixteenth century purveyed an elixir of aloes, myrrh and saffron; Roger Bacon put his faith in viper's flesh, to be taken only when the sun is ascending. The use of magical specifics to outwit death, although still prevalent, has diminished with the advance of general scientific knowledge. Even quacks and cultists have turned from the sale of magical charms to the promotion of pseudo-hygienic regimes. Commercial agencies exploit human credulity by selling health magazines, membership in health clubs, books containing formulae for longevity, exercising appliances and courses in physical culture. Semireligious movements feature health rejuvenation; anti-tobacco and anti-alcohol evangelists use pleas for the extension of life in their propaganda. The Christian Science church has been the most

influential of the spiritual health cults. Its founder, Mary Baker Eddy, declared that "man is, not *shall be*, perfect and immortal" (*Science and Health*, new ed. Boston 1906, p. 428); and although she admitted later that physical death was possible, her disciple Augusta Stetson proclaimed until the end that she would never die. Pseudo-hygienic cults promoting a longer life seize upon some single factor, often of real but limited value, and ignore all other aspects of the health situation; an example is the health movement recently popular known as Fletcherism, which elaborated the doctrine of the necessity of thorough mastication of food into a system of "dietetic righteousness."

Until the human race has been educated out of its credulity, short cuts to health and long life will continue to enlist at least temporary followings. For the development of a social movement of any significance, however, there must be an end generally accepted as desirable and a means capable of achieving it. As long as dominant opinion looked forward piously to eternal life after death there could be no social movement for the prolongation of earthly existence, however large the trade in elixirs. In the modern world health and long life are respectable social ideals and scientific medicine has amply demonstrated its efficacy in promoting them. The average length of life in Europe and America has increased with the advance of medical knowledge and its application. At the end of the eighteenth century the expectation of life at birth in Massachusetts was about thirty-five years; in the United States Registration Area in 1900 it was forty-nine years and it is now about fifty-eight years. The increased expectation of life has been confined to the lower age groups and has been due almost entirely to the reduction in infant mortality and in the mortality from the serious infectious diseases; no gain has been made in the expectation of life after forty-five.

It has been only within the last twenty-five years that there has developed an organized movement with the prolongation of life as its avowed objective. The modern life extension movement aims at the fuller application of preventive medicine in all its branches; more especially it strives to reduce the mortality from the serious chronic diseases of middle age—heart and kidney diseases and cancer—which have assumed increasing importance as causes of death. The corner stone of the movement is the promotion of periodic health examinations, with

the object of insuring early diagnosis and prompt correction of incipient degenerative processes and the instruction of the patient in the manner of living best adapted to his condition. The impetus behind the development of the movement was the economic interest of life insurance companies in reduced mortality. At a meeting of the Association of Life Insurance Presidents in 1909 Irving Fisher urged as a sound business investment the promotion of health work and the provision of free periodic health examinations to life insurance policyholders, and the movement which was subsequently initiated has made the life insurance companies among the most powerful forces in American health work today. The movement is now by no means confined to insurance companies and is being vigorously supported by the public health services and the medical profession. The companies cooperate with the public health authorities in general educational work, conducting health demonstrations, issuing pamphlets and giving lectures; they make special efforts to keep their own policyholders alive by the offer of free periodic health examinations, by sending out health literature and in some cases by providing free nursing service to industrial policyholders. Although the movement is mainly American, some Canadian, English, Australian and Japanese companies have engaged in health activities.

The importance of periodic health examinations has been publicized especially by the Life Extension Institute, Inc., which was organized in 1913 as a self-supporting stock company to make such examinations for life insurance companies, industrial and social organizations and for individuals; in 1929 it served over forty life insurance companies and examined about 130,000 people. There are also organizations which sell periodic laboratory tests by mail and issue health advice to their clients.

The attempt to control serious chronic diseases through the education of the individual in personal hygiene has become an increasingly important factor in the modern public health campaign; in this work public health nurses have performed excellent service. In 1922 the American Public Health Association adopted as its goal the addition of twenty years to the average length of life within the next fifty years.

Preventive medicine must depend largely upon the individual practitioner; yet until ten years ago the medical profession did little to encourage periodic health examinations. This was due partly to restrictions imposed by the

code of medical ethics on anything resembling advertising; perhaps an equal deterrent has been the tendency on the part of physicians to regard only the treatment of the sick as their concern and to leave prevention to the public health departments. But at its meetings in 1922 and 1924 the American Medical Association adopted resolutions urging its members to promote periodic health examinations. The organized medical profession now engages extensively in educational work; books for the use of physicians on preventive medicine have been issued by professional associations; and the preventive aspects of individual medical practise are being stressed in the medical schools. In addition to the insurance companies, the public health services and the medical profession voluntary organizations, such as the National Tuberculosis Association, the American Social Hygiene Association, the American Society for the Control of Cancer and the American Heart Association, encourage research, promote healthful legislation and engage in educational work. The American public has been slow to respond to this extensive propaganda. Only about 10 percent of insured persons to whom it is offered have availed themselves of the free examination service; a survey by the Commission on Medical Education (*Report*, no. i, New Haven 1927, p. 63) revealed that only 3.4 percent of the office visits to general practitioners were for physical examinations and that of these 95 percent were for life insurance purposes.

Since the initiation of the movement the expectation of life has almost attained the addition of fifteen years suggested by Fisher in 1909 on the basis of his calculation of the degree of preventability of the principal causes of death. This increase has been due mainly to the reduction in the mortality from tuberculosis, typhoid, diphtheria, diarrhoea and enteritis. No decline is discernible in death rates from cancer, heart disease or nephritis. It is probable that a further reduction in the incidence of infectious diseases of childhood and venereal diseases will result in a reduced mortality from heart and kidney diseases and that medical research will finally succeed in transferring cancer into the category of preventable diseases. There is every prospect that the advance in general longevity will continue until the expectation of life approaches the limit of the natural life span, the length of which has not yet been conclusively determined. Fisher, assuming a natural life span of one hundred years and the continuation of the present

rate of increase in the average length of life, estimates that an American infant born in the year 2000 may have an expectation of life of eighty-two years. Hornell Hart, ignoring biological limitations and assuming as a probability the continuance of the present rate of acceleration in the increase in the average length of life, calculates that a life expectation of two hundred years may be reached during the next century.

LIFE INSURANCE. The general principle of insurance is perhaps as old as civilization. It consists in making a small present sacrifice in order either to avoid a greater loss or to reap a reward at a future time. The development of

monetary contracts as they now exist has been much more recent, although they were known in early times. In the second century of the Christian era the Roman *collegia* built up funds to provide burial for their members; and some insurance of this sort, often connected with crafts or guilds, has been maintained in many communities from that time to the present day. Marine insurance was in all probability the earliest form of corporate insurance involving monetary benefits.

Life insurance, a more modern product, has two principal origins. The first is in marine insurance. The owners of vessels found that under the trade practises of early days the life of the captain sent off on a trading voyage was almost as important as the safety of the ship itself. There consequently arose the system of insuring not only against the loss of the vessel but also of the captain's life for such period as the voyage might cover. The second origin is in the craft guilds. From earliest times men of similar occupation or with common interests bound themselves together in friendly association. Members were helped in sickness and old age, and burials were arranged. On the death of a member it became customary to seek charitable donations on behalf of the family. This charitable practise developed into a right, and each surviving member was assessed a fixed sum for each death. In some cases the contributions were made definite, and the amount was distributed among the beneficiaries. Out of these practises arose the early forms of life insurance along assessment lines. When a corporation was formed in order to transact this business on a commercial basis, it was necessary to charge each entrant a fixed amount in advance; that is to say, a premium, to prevent the danger of non-payment of assessments at the end of the year. Accordingly estimates had to be made at the beginning of the year and a premium had to be assessed according to the magnitude of the sums which would probably be paid at the end of the year.

During the seventeenth and the early eighteenth century a number of scientists, notably Sir William Petty, Dr. Edmund Halley and Abraham de Moivre, had devoted much attention to the mortality rate of the population. They found that while it was impossible to foretell the date of death of an individual the death rate of any large group of persons remained consistent and predictable from year to year and also that there was a steady decrease in physical

resistance throughout later life. It was seen that the assessment system contained a fundamental weakness, since the risk of death increased with age and men of the average age of sixty must show a different death rate from that of a group of the average age of thirty or forty. Equal assessments for all ages as at first practised were therefore unjust. One of the best of the old assessment corporations, the Amicable Society for a Perpetual Assurance Office, which had been chartered in England in 1706, refused to accept for insurance any applicant over the age of forty-five. This was a partial meeting of the difficulty.

Out of these speculations there developed the Society for Equitable Assurances on Lives and Survivorships, which was planned and promoted in London in 1756. Much opposition to the granting of a charter arose and business was therefore begun in 1762 under a deed of settlement. The company, familiarly known as "The Old Equitable," is still active, proving the wisdom of its founders. Formed by policyholders for their mutual protection, it was the first to be based on a scientific calculation of level premiums for life with the provision that no increase in the premium could take place despite the increase of mortality with advancing years. It must be readily understood that because a man of thirty-five, who pays a level premium for life, is subject to an increasing mortality rate, he must in the early years pay a larger sum than is needed for the immediate cost. The excess must be carried forward at interest to meet the heavier mortality charge when it arises. This is a fundamental concept in level premium life insurance and it accounts for the large accumulation of company funds, which are not earnings or surplus but would be more accurately termed accruing liabilities.

In calculating a fixed premium for life it is necessary to use two factors, the influences of which will be felt for a long time in the future. These are a death rate and an interest rate. A third element in practical management, the expense of handling the business, is a factor depending on individual conditions and control. The first premiums of the Equitable Society were calculated from observations on mortality in the city of London. These were unduly high and were changed in 1782 to the basis of the well known Northampton Table—also high for men in good circumstances and in good health. The contrast between the death rates of the Northampton Table (based on the mortality ex-

periences of the English city of Northampton over the period 1735 to 1780) and those of the American Men Table (covering an investigation from 1900 to 1915 and based on the experiences of life insurance companies) is illuminating. The figures in Table I are for a few specimen ages. The Northampton Table, because it dealt

with the general population of a town less healthy than many other communities, was faulty in construction, so that the death rates were exaggerated. On the other hand, the American Men Table deals with modern conditions and healthy male lives all of which have been approved for life insurance purposes.

TABLE I
NORTHAMPTON AND AMERICAN MEN MORTALITY TABLES, SELECTED AGES

Source: Price, Richard, *Observations on Retentionary Payments* . . . (1783, London 1783, vol. II, p. 311, 313; and United States, Bureau of the Census, *United States Life Tables* . . . (1921) 226-39.

A mortality table purports to trace a complete body of persons (as, for example, a group of 100,000) from the cradle to the grave. If the rates of mortality for each age can be determined, there can be derived from them a complete table from the beginning to the end of life. The death rate of 3.92 per 1000 persons derived from 98,199 persons at the age of twenty is given above. If similar rates are obtained for all other ages, then, commencing with an arbitrary number such as 100,000 (called the radix of the table), the number who would die in each year of age from such death rates can be computed. These rates if obtained over a brief period of years do not take into account the climatic, social or racial changes which may occur in a long period, such as one hundred years, which the table in theory purports to cover.

The early forms of life insurance were either for temporary uses or were ordinary life policies as developed by the Equitable Society. If each of the 98,199 persons living at the age of twenty is insured for \$1000, according to the American Men Table \$385,000 is needed at the end of the year for payment of all claims. The premium paid at the beginning of the year earns a year's interest, making it necessary to discount this \$385,000. At $3\frac{1}{2}$ percent interest the present value at the beginning of the year is \$385,000

divided by 1.035, or \$371,982. The share of each one of the 98,199 would therefore be \$3.79. This is the net cost of \$1000 insurance to be paid in event of death within one year. For a similar \$1000 in the second year the amount to be provided would be \$393,000, and discounted for two years the single premium for the second year would be \$3.74. Therefore the single premium for two years will be the sum of the two, or \$7.53. To determine the single premium for the whole of life this process has to be continued for every age to the limit of the table. A popular error is that the function known as the "expectation of life," which is the average number of years lived by a group of any given age, can be used for premium and other calculations. But this method is mathematically incorrect and is therefore not used by actuaries.

Developments on the European continent and in the United States did not follow far behind those of England. In France the Compagnie Royale d'Assurance sur la Vie was authorized to begin business in 1787 and enjoyed a state monopoly until 1792. In 1820 with the chartering of the Compagnie d'Assurances Générales sur la Vie French life insurance was definitely launched on its modern career, and before a decade had elapsed some seven companies were dividing the field. In Germany the first success-

ful companies to make their appearance were the Lebensversicherungsbank für Deutschland, chartered in 1828 at Gotha, and the Deutsche Lebensversicherungsgesellschaft, chartered in the same year at Lübeck. Branches of English companies were soon to be found operating in Germany, Holland and the Scandinavian countries; the branches of French companies found profitable fields of activity in Spain, Belgium, Italy and Switzerland. Prior to 1843 most of the life insurance in the United States was written by foreign companies, which were subjected to but slight supervision. With the opening of offices in 1843 by the New England Mutual Life Insurance Company and the Mutual Life Insurance Company of New York there began a new era in life insurance history in the United States; by 1870 there were 110 life insurance companies in the country which were operating either as mutual, joint stock or joint stock and participating companies.

While the policies of these early American companies followed scientific principles, many of the conditions written into them appear illiberal by modern standards. Thus the policies of pre-Civil War America had no surrender values, made no provisions for loans to policyholders and allowed no days of grace. Policies became void in many circumstances that would today be considered unfair: suicide or death by dueling, for example, voided the policy; a trip to North Carolina, Georgia or Florida or an ocean voyage (without permit and extra premium) likewise made the policy "null, void and of no effect." Today travel, residence and occupation are entirely free after a policy has been issued; suicide is a risk that is covered after a period of not more than two years from issue. Even if the insured discontinues his premium payments and neglects to claim any equity, a fair and just return is made and is maintained on the company's books, whether or not the insured protects his own interests.

During the period from 1855 to 1872 the subject of state supervision came increasingly to be discussed. It was felt that life insurance should be guarded by the state as a semipublic trust. Massachusetts led the way by creating a board of insurance commissioners and in 1855 established the first state insurance department headed by a paid commissioner. New York followed Massachusetts' example in 1859, and before 1870 thirty-five of the states had either established special insurance departments or delegated supervision to specified officials. Rules

were devised for licensing all life insurance companies and they were called upon to submit statements on standard forms and observe fixed rules in the valuation of their business and assets in order to secure a certainty of payment to beneficiaries under their contracts. The tables of mortality and the maximum rate of interest to be used were prescribed by law. Massachusetts not only was a pioneer in state control, but in choosing Elizur Wright as its first insurance commissioner it gave a great impetus to the development of life insurance methods along sound lines. Wright was an original thinker and did not always follow the practices of Europe, although he studied them. The annual net premium valuation, the licensing of agents, the maintenance and investment of all reserves for United States business within the United States, non-forfeiture benefits in event of lapse and the prohibition of the writing of life insurance by any corporation granting fire, marine and some other forms were features introduced by Wright; in all these particulars the American requirements differed from those of Europe. These supervisory rules were difficult of adoption by European companies and resulted in a gradual withdrawal of practically all such companies from the United States. Since the 1880's little life insurance has been granted in the United States except by domestic and Canadian companies.

In the last quarter of the nineteenth century there developed in the United States a speculative phase in life insurance contracts through the issue of the so-called semitontine policies. The word tontine implies an enhanced benefit to survivors after a period like twenty years, earned at the expense of those who meanwhile die or discontinue their contracts. Such policies furnished guaranteed benefits in event of death but provided large returns to survivors, partly accumulated from year to year and partly made up of values lapsed and forfeited by those who failed to maintain their insurance. These tontine surplus policies were merged into the deferred dividend idea; both resulted in much disappointment. The interest earnings, which were 6 percent or 7 percent when the tontines and estimates were originally issued in the 1870's, fell rapidly and by 1900 an interest rate of 4 percent was not unusual. Surplus earnings were therefore much less than those estimated.

One of the effects of the high priced tontine policies was a renewal of interest in cheap insurance in term forms; there even took place

a revival of the ancient idea of assessment insurance. From 1875 to 1895 many corporations were launched to write assessment insurance, some of them being fraternal organizations and others assessment insurance corporations. The advocates of this type of insurance insisted so much upon the novelty of their plan that it became common to speak of the regular, full reserve and level premium plans as "old line." After twenty or twenty-five years of operation an assessment company usually begins to find the mortality rate increasing. The average age becomes greater, necessitating increases in assessments. Any increase in cost makes policyholders scrutinize their insurance and some of the healthier give up assessment protection, possibly taking permanent forms at fixed rates. The agents of the regular companies aid this movement. These discontinuances of the policies on healthy lives raise the proportion of the unhealthy, causing a still higher mortality rate with the need of still further increased charges. When once this process starts it becomes cumulative and ends in the disintegration of the corporation.

The result of the deferred dividend and assessment plans was a large number of disappointed policyholders of both types in the period from 1897 to 1904 and the rise of a powerful wave of popular dissatisfaction. Contributing to the same dissatisfaction was the appearance of a factional dispute in one of the large New York companies, the stock control of which was held by a single person who did not retain the confidence of the directors. Public opinion was aroused against the principle that the interests of thousands of policyholders might be jeopardized by a small stock interest held by one man. Other items of unfavorable publicity and some glaring instances of extravagance were brought to light, all of which resulted in the appointment by the New York legislature in 1905 of a joint legislative committee with sweeping powers, the so-called Armstrong Committee, to investigate life insurance and the life insurance companies licensed in New York state. The investigation threw a lurid light on some wrongful practises, and changes in the New York law were made. The following brief summary of the legislative changes will show the lines of popular clamor and the nature of the abuses which were attacked.

First, syndicate participations were prohibited. Second, facilities were created for converting a stock corporation into a mutual life

insurance company. Third, elaborate regulations for voting by policyholders in mutual life insurance companies, including the right to vote by mail, were set up. Fourth, directors' qualification was extended to permit any policyholder in a stock life insurance company to qualify for directorship. Fifth, investment powers were restricted; especially stock and collateral trust bonds were prohibited as investments for life insurance companies. Sixth, officers and directors were not to derive any personal profit by commission or otherwise from any investment or loan made on behalf of the company. Seventh, the formation of any new assessment insurance corporation was prohibited. Eighth, a limitation was placed on agency expenses and commissions. At first this was too drastic, making inadequate allowances which had to be expanded. The principle is still in effect. Ninth, a limitation was placed on surplus. The original provisions of this were also too drastic and were later extended. The early limits were clearly unsafe, if indeed any limit can be justified. Tenth, the amount of new business which a company could write annually was restricted. This too was afterward expanded. Eleventh, a company issuing participating business could not also issue non-participating. All mutual companies could issue participating business only. A stock company could select either participating or non-participating but could not write both after January 1, 1907. Twelfth, there was to be a compulsory annual distribution of surplus. Thirteenth, there was to be the compulsory use of a standard policy form in New York state by all life insurance companies. This was put in effect for a year or two, but it prevented initiative and improvement; the law was afterward repealed and standard provisions substituted. Fourteenth, the companies' liabilities were to be evaluated by the "select and ultimate" method. An attempt was made to compel the sale of all stockholdings and of real estate within five years after acquisition. The superintendent of insurance was given discretionary power to extend this period, and extensions were granted from time to time. Some holdings could not have been sold at anything like their true value if this five-year order had been held effective.

As a result of the facilities for mutualization extended by the New York law two of the largest and one of the smaller New York companies retired their stock and became mutual companies. A third large corporation in New Jersey took steps toward the same end, depos-

iting its stock with trustees on behalf of the policyholders. These transformations took place without being accompanied by any essential change in the executive management of any one of the companies.

The life insurance disclosures were discussed and considered by nearly every state in the union. One of the early results of the New York investigation was the meeting at Chicago in February, 1906, of a national conference of governors, attorneys general and state insurance commissioners, which in turn set up a Committee on Uniform Legislation (the so-called Committee of Fifteen). Other investigations took

place, notably in Canada and Wisconsin, and many new laws were enacted. Most of the states followed with more or less modification the recommendations of the Committee of Fifteen. The companies generally were shown to be financially sound and the publicity attending these inquiries and legislative activities gave an extraordinary impetus to the industry throughout the country. The amount of insurance in force in the United States almost doubled over the decade between 1901 and 1910, increased more than two and a half times in the next ten years and again increased more than two and a half times in the decade of the 1920's. Table II shows

TABLE II

GROWTH OF THE BUSINESS OF AMERICAN LEGAL RESERVE LIFE INSURANCE COMPANIES, 1850-1931

| YEAR | INSURANCE IN FORCE | ASSETS | PAYMENTS TO POLICYHOLDERS AND BENEFICIARIES | NEW BUSINESS |
|-------|--------------------|----------------|---|----------------|
| 1850 | \$ 47,862,221 | \$ 4,138,391 | \$ 642,495 | \$ 14,233,193 |
| 1870* | 2,023,884,955 | 269,520,440 | 44,949,257 | 587,863,236 |
| 1890 | 4,048,846,781 | 770,972,061 | 90,007,519 | 1,144,114,318 |
| 1900 | 8,562,080,722 | 1,742,414,173 | 168,687,601 | 1,973,611,066 |

the great expansion of life insurance in the United States over the period extending from 1850 to 1931.

Two events in the last fifteen years have particularly aided the growth of life insurance. The first of these was the adoption by the government of war risk insurance, devised with the intention of forestalling claims for bonuses or pensions on the part of veterans. In 1917, when the United States entered the World War, life insurance up to \$10,000 was offered to every soldier at standard net rates for yearly term policies. The nation assumed the extra hazard of war and the hazards of mutilation, disablement and disease, for which fair and just compensation was promised. Most of the soldiers in the United States Army had the maximum insurance during service, the premiums being deducted from monthly pay. This brought to the attention of more than 4,000,000 young men the benefits of life insurance in its protective character. As if to emphasize its value the world was soon after afflicted by the influenza epidemic

of 1918-19, when thousands of young men and women apparently in perfect physical condition were suddenly carried off. Other stimulating influences on life insurance were seen in new business developments, such as group insurance for employees of large corporations, provision for the new inheritance taxes and the development of insurance trusts.

While the primary purpose of life insurance is protection of the family, the building up of an estate and guarding against an impecunious old age have become important phases. Policies with limited premiums create an equity more quickly than the ordinary life policy, while endowments, whereby the sum insured matures at a fixed time, make a still more direct provision for old age and furnish an income which can be determined in advance. Policies on partners, with the sum insured payable at the first death, provide funds at a crucial time. Creditors take out insurance on the lives of their debtors; borrowers protect a loan or mortgage; parents effect educational endowments to secure higher

education for their children. One of the early purposes was to furnish annuities in exchange either for a fixed purchase price or for annual premiums. An annuity may be on a single life or on two or more lives, as on husband and wife with benefit payable as long as either lives. It may be immediate or deferred, the deferred annuity being usually purchased by annual premium. Various selling features have had more or less temporary popularity, such as gold bond contracts, policies with coupons attached for dividends, part premium note settlements and the like. Payment of double face amount in event of accidental death can be secured at a small extra charge of about \$1.25 per \$1000. Between 1910 and 1930 a special disability benefit attained a great vogue: many companies granted a waiver of premium and an income of \$10 per \$1000 per month in event of total and permanent disability from accident or disease. This has been modified by most companies, however, and the income benefit has been discontinued by many because of serious losses in the later 1920's, when poor business conditions led to an unusually heavy claim rate under the appearance of disability. All of these developments have added to the popularity of life insurance and fostered its growth during the last ten years.

The scientific part of life insurance is handled by actuaries; and the development of actuarial science has kept pace with the activity and growth of life insurance. Sixty or seventy years ago after a college course in mathematics a young man could acquire a fair degree of proficiency by becoming associated with the actuary of one of the life companies. In Great Britain the actuaries formed the Institute of Actuaries in 1848, meeting regularly for study of common problems. In America a similar step was taken in 1889 when the Actuarial Society of America was formed by a group of actuaries living for the most part on the eastern seaboard. This society at first admitted members on the recommendation of its fellows, but soon it was found desirable to examine applicants; now nearly everyone who becomes a fellow passes a series of strict examinations. Twenty years later in 1909 another actuarial body, the American Institute of Actuaries, was started in Chicago. The two groups work in harmony and friendly accord; they conduct their examinations up to the associateship degree through a joint examining board. These examinations cover certain branches of higher mathematics and the more technical phases of life contingency calculations, also the

theories of interest, annuities, mortality tables, premiums and the like. The fellowship examinations are broader in their scope and deal with the commercial side of life insurance in the selection of risks, keeping of accounts, banking, finance and the elements of insurance law. In 1932 the Actuarial Society of America had 315 fellows and 263 associates. Some of these were also members of the American Institute of Actuaries, which reported 172 fellows and 175 associates. Both of these bodies advise their students as to the best courses of study and as to other matters; they also maintain libraries for research and reference.

The education of the public in life insurance is conducted principally by the agency forces. In the eighteenth century it was customary for business men to seek out the insurance company and apply for life insurance. This practise continued into the nineteenth century. But in the period from 1800 to 1830 a number of companies started to write life insurance as a business venture, as was already being done in marine and other forms. They appointed agents, who received commissions for the introduction of business. This innovation caused much comment and criticism at the time; the payment of the commission was often unknown to the client. Sometimes a man seeking life insurance would consult his solicitor, to whom he paid a consultation fee; it was unethical for the solicitor to receive also a commission from the company which he recommended. To this day the Equitable Society employs no agents and pays no commissions. Gradually the appointment of agents and the payment of commissions became the recognized practise. It tends to economy of supervision and rewards services according to results. Long experience has proved that people do not of themselves seek and purchase life insurance. Someone has to explain its nature, purpose and benefit before a man will rouse himself to make application.

Control of the agency systems in America is maintained under two different plans. The older of the two is the general agency system, under which a territory is allotted to a trained life insurance man, who is paid commission and allowances and who assumes responsibility for all business and outlays in his district. He selects and pays his subagents and solicitors, generally by commissions, sometimes granting drawing accounts against commissions to be earned. He also pays his own office force, collects premiums on a commission basis and so on. The other

plan is that of the managerial system, under which the district is controlled by a salaried employee appointed by the home office. The manager makes contracts on commission terms between the company and agents whom he may appoint. The central office of this manager's district is maintained by the company, usually with a cashier and clerical assistance. Responsibility for new business production within the territory rests with the manager; frequently his salary is determined by the volume in the preceding year.

One of the interesting differences between life insurance in Great Britain and in America lies in the varying agency systems. In America there is a great army of trained agents, salesmen or underwriters giving their entire time and energy to making contacts between applicants and companies. There exist college courses in salesmanship, and the degree of Chartered

Life Underwriter (C.L.U.) can be acquired. In Europe the agency system differs: there are many part time workers consisting of lawyers, bankers and merchants with no specialized knowledge, who write applications only for their clients and friends. The only salaried employees are the inspectors or supervisors, some of whom receive also a small overriding commission on the business of their district. There is no anti-rebate law in Great Britain; frequently a man who writes little more than the insurance on his own life is appointed an agent. The American system has been introduced into Great Britain by one or two Canadian companies; the outcome of the experiment will be of interest. The intensive drive for new business steadily conducted under the agency system has resulted in the leadership of the United States in volume of life insurance. Table III indicates that in recent years over 70 percent of the total life insurance

in the world was written by American companies.

The rate of interest earned is of great importance to the success of a life insurance company.

Additional interest earnings of 0.5 percent will make a difference of about 5 percent in the premium rate and more than 20 percent in the average dividend rate of a participating com-

pany. The average rates of interest earned by the life insurance companies operating in the state of New York over a period of years are as follows:

| | |
|------|-------------|
| 1880 | 5.6 percent |
| 1890 | 5.1 percent |
| 1900 | 4.5 percent |
| 1905 | 4.4 percent |
| 1910 | 4.6 percent |
| 1915 | 4.8 percent |
| 1920 | 4.8 percent |
| 1925 | 5.1 percent |
| 1930 | 5.0 percent |
| 1931 | 4.9 percent |

One of the most important functions of an

executive is therefore the supervision of the investments, and one of his main objects is to secure the highest interest return without endangering the principal. The trends of investments in the past fifty years can be seen from Table iv. Real estate holdings have diminished greatly. The growth of policy loans is a disturbing element, for such loans diminish the protective value of the insurance.

The payment of the proceeds of life insurance policies may be arranged under several modes of settlement. A cash payment is not always desirable, because the fund is so often dissipated through unwise investment on the part of a widow or other beneficiary lacking in business ability. Accordingly other plans are

available. The policyholder may provide that the insurance be paid in fixed instalments for a period of years; or the proceeds may be left with the insurance company at interest and the principal sum paid at some fixed date in the future, in some cases after the death of the beneficiary. The interest rate varies and is determined from

year to year by the board of directors and has run from $4\frac{1}{2}$ to 5 percent with a guaranty of not less than 3 percent. The proceeds may be applied to purchase an annuity, whether for life, for a term of years or for a fixed term and life thereafter. If the insured has a definite plan in view he can instruct the insurance company to carry

it out. If he wishes to leave the proceeds to a trustee with discretionary powers he can best do this through an insurance trust. The great trust companies of the country have been actively recommending life insurance and especially this form of trust for their well to do clients. Life insurance companies will not generally accept discretionary powers in handling such funds; this is the function of a trust company.

Industrial life insurance has also shown a most unusual growth in modern times. Started in England in 1853, the principle was soon introduced into Germany, Austria, Switzerland, France, the United States and Japan; the first American company to write such policies was the Prudential in 1875. The chief appeal of this type of insurance is made to the urban working class population as a means of providing a fund for burial purposes. The average face value of industrial policies is now a little over \$200, having risen gradually to this figure from an average of \$110 in 1890. The chief characteristics of this form of insurance are the following. First, premiums are fixed for all ages at five cents and multiples per week, the adjustment for age being made in the amount of the insurance written. Second, premiums are payable weekly and are collected by agents who call at the homes. Third, the policies have no cash or other surrender values in the early years but usually acquire such values after they have been ten years in force. Fourth, the entire family down to the youngest infant can be insured. Under the New York law the maximum insurance in infancy is \$100 to the age of one, which increases \$100 with each year of age to \$1500 at the age of fourteen to fifteen. Fifth, the system of agency compensation is quite different from that of the ordinary branch, being a percentage collection fee, called the debit, based on the weekly collections plus x times the increase in the amount of such collections. The agent gets compensation for new premiums only as the total collections of his district increase. The volume of such business in force in the United States is shown in Table v.

The nature of industrial insurance, whereby premiums are collected from door to door and in small individual amounts, necessarily causes the expense rate to be high in relation to other forms of life insurance. In addition to this collection expense the small individual unit makes for additional cost; also holders of such policies are subject to a much higher rate of mortality.

Facilities are granted to industrial policyholders to pay their premiums voluntarily at branch offices and thereby obtain a 10 percent reduction in the premium; this method is fairly widely used. In the vast majority of cases, however, the system of collecting from door to door is followed. The lapse rate of industrial policies is noticeably higher than ordinary business because of the way in which such policies are written. A large number of the lapses take place shortly after the insurance is written; the companies are trying to devise means of avoiding this wastage, just as they try to reduce the collection expense. The industrial insurance agent is closely supervised and works long and exacting hours, for which he receives no more than a modest compensation.

TABLE V

INDUSTRIAL INSURANCE IN THE UNITED STATES,
1880-1931

| YEAR | NUMBER OF POLICIES (in 1000) | INSURANCE IN FORCE (in \$1000) |
|------|------------------------------------|--------------------------------------|

Various states in the United States as well as some foreign countries have offered life insurance facilities. In general it may be stated that unless the plan is subsidized by the state and a regular selling organization maintained, such plans have been unsuccessful, and many of them have been discarded or allowed to become inactive. In two or three instances state insurance has achieved a fair degree of success. The outstanding case is that of New Zealand, which conducts a life insurance department in all respects similar to regular life insurance companies, having agents who are compensated by commissions. The life insurance department uses the facilities of the postal service, for which it pays for any insurance work done. New Zealand has avoided granting to its insurance department special favors which are not available to private carriers. The result is that mutual life insurance companies in the same territory are competing on favorable terms with the government agency. In Massachusetts by the end of 1931 each of twenty savings banks was insur-

ing residents of the state up to \$1000, making possible a total individual insurance of \$20,000. Some of the overhead expense has been borne by the state; individual propagandists and salaried employees have been furnished by interested parties, and taxation favors have been granted. In 1931 these twenty savings banks were carrying 101,000 policies to the amount of \$90,960,000. In Japan industrial insurance is a state monopoly which is run in conjunction with the postal department. Letter carriers act as collectors and a large volume of insurance has been written. Italy in 1912 decreed that life insurance in all branches be a state monopoly and has taken over the business of American and other foreign companies.

LILBURNE, JOHN (c. 1616-57), British political and social reformer. Leader of the Leveller party during the Interregnum, Lilburne's special distinction lay in his combination of progressive thought with vigorous action. He was the enemy of what he conceived to be oppression, whatever its aspect. Before the civil wars he took up the cudgels against episcopacy; during the wars he fought on Parliament's side but resigned his commission in 1645 after his refusal to take the covenant according to the New Model Ordinance. He came into conflict with both houses of Parliament because of his outspoken criticism of their political and religious policy. From 1645

onward he spent considerable time in prison, whence he issued a continuous stream of pamphlets, such as *England's Birth-right Justified against All Arbitrary Usurpation, Whether Regal or Parliamentary, or under What Vizard Soever* (London 1645) and *London's Liberty in Chains Discovered* (London 1646). Formulating under the pressure of his personal experiences the doctrines of extreme political democracy which had always been implicit in his outlook and temperament, he became during 1647 the leading spirit and one of the organizers of the Leveller party, the first English radicals (see LEVELLERS). He was a member of the committee set up to frame the Agreement of the People, in which was set forth a series of political reforms based on the inalienable rights of the individual. The publication of a pamphlet entitled *An Impeachment of High Treason against Oliver Cromwell and Henry Ireton* (London 1649) led to his trial on a charge of attempting to overthrow the government. He made a speech in his own defense and his acquittal was received with tremendous enthusiasm, a medal being struck to commemorate the event. He was banished in 1652 and returned only to be rearrested. His second trial in 1653 roused even more popular interest than the first. By his practise as much as by his theories Lilburne became the chief disseminator of radical doctrines in the Interregnum period.

LILIENBLUM, MOSES LEB (1843-1910), Zionist publicist and Hebrew writer. Lilienblum was born in Lithuania, which was then part of the Russian Empire, and his life is typical of the later period of the Jewish enlightenment, or *haskalah*, in Russia. He began in the liberal days of Alexander II with a fight against the dominance of the Talmud, pleading for a reform of the rabbinic laws in the spirit of the new age. Persecuted by the orthodox Jews, he moved to Odessa and soon came to see the shortcomings of the *haskalah* in undermining the old folk vir-

tues without producing positive values in their stead. His disillusionment was depicted with bitter outspokenness in his autobiography, *Chattoth neurim* (The sins of youth, 2 vols., Vienna 1876), his best piece of writing. Influenced by the positivist utilitarian and socialist doctrines of Chernyshevsky and Pisarev, he attacked the Jewish educational ideas of both the rabbis and the modern *haskalah* as equally remote from life; instead of furthering useful studies and productive occupations they breed idleness and poverty. He declared that national distinctions are but accidental and conventional and that in the future all peoples will be merged into a tribeless humanity. From these cosmopolitan dreams he was shaken in 1881, when with the accession of Alexander III a period of reaction set in and a wave of pogroms swept over Russia. The effect of those days he described in *Derech teshuvah* (Road of return, Warsaw 1899). Like a sudden illumination the thought came to him that the Jews are aliens everywhere and that their only salvation lies in being domiciled once again upon their ancestral soil. His positivist philosophy also contributed to his conversion to Zionism, and he threw himself wholeheartedly into the *Hovevei Zion* (Lovers of Zion) movement. Opposing the spiritual Zionism of Ahad Ha'am he demanded a practical attitude in the colonization of Palestine: Palestine should be restored not for the sake of Hebrew culture but in order to lift the Jewish people out of its political degradation. This seemed possible to him even without political independence, for what mattered was not government but "historic citizenship" upon the soil of a homeland.

LILIENFELD-TOAILLES, PAVEL FEDOROVICH (Paul von Lilienfeld) (1829-1903), Russian sociologist. Lilienfeld, the most extreme representative of nineteenth century sociological organicism, was the descendant of a noble Swedish family which had settled in Livonia. He was born in Białystok. After studying at St. Petersburg he held important Russian judicial posts and was for seventeen years gov-

ernor of Kurland. As an avocation he engaged in much sociological writing, chiefly in German, although his first important works and the first version of his magnum opus, usually known as *Gedanken über die Sozialwissenschaft der Zukunft*, were written in Russian and he wrote also in French. As president of the Institut International de Sociologie from 1897 to 1898 he officiated at the third International Sociological Congress.

In comparison with Lilienfeld, whose work is based on the assumption that human society is a "real organism," Spencer and Schäffle, the other prominent organicists, were very cautious indeed. Lilienfeld's work collapses completely if the assumption of organismic homology which he used is destroyed. He was quite aware of the extreme nature of his organicism and of the differences between himself and other writers.

His later works were little more than variations on the organismic motif set by the *Gedanken*, and he regarded his doctrine that society is a real organism as his great contribution to sociology. His writings are filled with the terminology of scientific biology; material culture, for example, is "social intercellular substance." Although Lilienfeld possessed considerable erudition (his writings abound with references to Darwin, Tylor, Waitz and others not usually cited as early as the 1870's), his intellectual gifts were not of the highest order. Much of his work is mere journalistic prattle. His importance was negative; for sociologists of the late nineteenth century he was a horrible example of the consequence of taking seriously his own dictum, *Sociologus nemo nisi biologus*.

HOWARD BECKER

Important works: Under pseudonym Lileyewa, *Osnovniya nachala politicheskoi ekonomii* (Fundamental principles of political economy) (St. Petersburg 1860); under initials P. Leipsic 1922) p. 359-72; Coker, F. W., *Organismic Theories of the State*, Columbia University, Studies in History, Economics and Public Law, vol. xxxviii, no. 2 (New York 1910) p. 139-53; Worms, René, in *Revue internationale de sociologie*, vol. xi (1903) 265-67.

LIMITATION OF ACTIONS, in Anglo-American law, denotes the requirement that judicial relief be sought within a fixed period after the occasion for it arises. The term prescription has been variously used in this connection in different legal systems. In the modern civil law, which makes the most elaborate distinctions, if a claim to property is not asserted judicially within a fixed period, the claimant's rights are extinguished (negative or extinctive prescription) and his adversary's claim confirmed (positive or acquisitive prescription). There has been much discussion as to whether the limitation requirement is remedial or substantive. As governing the commencement of actions it now appears to be remedial, and provisions relating to it are usually found in the American codes of civil procedure; but as a mode of acquiring ownership it seems to be a rule of property and as such is incorporated into most Romanesque civil codes. Modern legislation dealing with limitation of actions in reference to property has for its object the security of titles, which would be jeopardized if ownership could be questioned at any time without limitation. The general rationale of these rules has been interpreted as proceeding either from grounds of public policy or from a presumption that legal title had been acquired in the elapsed time, since no suit had been brought sooner. In its reference to personal rights and to crimes the theory is much the same as that of bankruptcy laws—the debtor should not be pursued forever. In most legal systems the limitation concept is now expressed in statutory form, and in English law it must be so expressed; but such was not always the case.

It has been said that primitive peoples have no statute of limitations, but only in the barest literal sense is this true. The underlying concept appears in early society. There is little doubt that the limitation concept arose while law was still customary and while self-redress was still tolerated, for it constituted a restriction upon the latter. The lingering tradition of self-redress may indeed have operated to delay the embodiment of limitations in the written law.

Limitation is older as a substantive rule of property than as a remedial rule. In fact the limitation seems connected with the origin of private property. Primitive ownership appears to have resulted from contact with an object, which thus became a part of one's personality. If there was no other claimant, the object became at once the property of the one making

the contact. (In Roman law this concept developed into that mode of acquisition called *occupatio*, which feudal law rejected.) If, however, another claimed the object he must assert his claim with reasonable promptness or suffer its forfeiture. It was as *usucapio* (taking by use) that the concept was first fully worked out. According to Loria the Roman *usucapio* was intended to reward economic initiative by penalizing landlord absenteeism. In Sohm's view, *usucapio* in classical Roman law performed a twofold function: it transformed bonitary (equitable) ownership into quiritary (legal); and it protected the title of an individual who had acquired a thing *bona fide* from a non-owner. Both Gaius and Justinian speak in their Institutes of the rule as designed to prevent an overlong uncertainty regarding ownership. Long before either Demosthenes had stressed the unreasonableness of requiring a possessor to preserve his evidence forever. *Usucapio* was a rule of Roman law earlier even than the Twelve Tables. That collection provided for acquiring ownership by possession of two years for immovables or one for other property. The principle was still recognized as late as the time of Constantine, who, however, lengthened the periods to forty years.

Caesar and Tacitus note that the Germans were wont to change each year the allotments of their lands; this system together with their nomadic life gave little chance for a custom like *usucapio* to grow up among them. It was not until about the ninth century that it began to develop and it appeared then in the form of the *Verschweigung*, a custom eventually enforced by a judicial peace ban which required all who impugned any existing condition to do so within a fixed period, usually "a year and a day," but lengthened later. Among the Franks this took the form of the "citation seisin," by which a claimant to land was judicially called upon to assert his claim within the prescribed period or suffer "acquiescent preclusion." Ultimately the system spread over most of western Europe. It prevailed in France for centuries, and in mediaeval Germany as *Auflassung* it is said to have been the exclusive "mode of assurance." All this, however, was restricted to land. The general doctrine of *usucapio* was not adopted in Germany until the reception of Roman law. The present German Civil Code recognizes *usucapio* as to movables, but as to immovables only for curing defective entries in the registry.

Anglo-Saxon law like the other Germanic

systems did not include the concept of *usucapio*. Not even the "fine and recovery," or fictitious compromise, followed by seisin, appears before the Conquest. But William the Conqueror early in his reign decreed that open possession for "a year and a day" was a sufficient defense to another's claim against the finder of an object. Under the Nottingham charter from Henry II if a serf or other person "dwell in the borough a year and a day in time of peace, no one except the king shall have any right in him." The same period afforded the "preclusive bar" fixed by the fine and recovery, and Maitland concludes that this was "originally the only possession that could become ownership by the lapse of a year and a day." In Bracton's time the period seems to have been shortened. Bracton wrote of *usucapio* (sic) and considered *longa possessio* sufficient for ownership. He applied the principle especially to incorporeal rights, like those of common, which had been protected by a plea of seisin since before the Conquest. The traditional view in England has been that extinctive prescription does not extend beyond incorporeal property, but it so extends under certain American statutes.

From a custom based on a natural presumption or designed to protect property rights it was a short step to one which required the timely assertion of other claims. In the Hebrew "book of the law" (seventh century B.C.), later incorporated into *Deuteronomy*, creditors are required to release their debtors at the end of every seventh year (xv: 1, 2). Demosthenes praises the principle in Attic law and attributes it to Solon. By the Twelve Tables not only tangible property but marital rights may be acquired by *usucapio*; and a claim against an alien is declared perpetual—i.e. he can never invoke a limitation—thus implying that there were limitations in claims against Romans. But, according to Hunter, Roman prescription as applied to rights in personam began when the praetor, introducing new actions, limited them to a fixed period, generally a year. If the action was of legislative origin it could be brought at any time, but the non-transmissibility of certain actions, not alone delictual ones but also certain contractual ones (e.g. those founded on a stipulation), afforded a species of limitation: a proceeding to enforce them had to be brought within the lifetime of one or both parties. As to delictual actions the same principle operated in English law down to the passage of Lord Campbell's Act in 1846, which allowed an action by the near relatives

of the deceased in the case of wrongful death. This act was generally followed in the United States. A rescript of Honorius and Theodosius in 424 fixed a limitation of thirty years for personal actions (those to enforce obligations) as well as those in rem; but for some actions a longer period was stipulated later.

In English law there appears to have been no procedural limitation until after the Conquest. In the following century there was a limitation for the writ of right, which could not go back to the end of the reign of Henry I (1135). The Assize of Novel Disseisin was limited in Glanville to the king's last passage to Normandy. Bracton appears to make *usucapio* applicable to all actions; but legislation on the subject proceeded: by the Statute of Merton [20 Hen. III, c. 8 (1235)] the limitation for a writ of right was brought down to the beginning of the reign of Henry II (1154); by that of Westminster I [3 Edw. I, c. 39 (1275)] it was further extended to the beginning of the reign of Richard I (1189), where it long remained. The act of 32 Hen. VIII [c. 2 (1540)] was framed on the Roman principle of fixing a period—thirty years of the defendant's own seisin or sixty of his ancestor's—to support a writ of right and fifty years for a possessory action and certain others. The statute of 21 Jac. I [c. 16 (1623–24)] limited writs of formedon and, in effect, ejectment as well as personal actions. This was the first general English statute of limitations and it was extended to the colonies, including those of America. Meanwhile Chancery, through its doctrine of laches, applied the principle "from the beginning of this jurisdiction . . . without the help of an act of parliament."

Before the time of Gaius the *praescriptio*, which was a note prefixed to the praetor's *formula* directing the trier of fact to dispose first of some preliminary question, was available to the defendant to raise various defenses. In the third century the defense of lapse of time (*praescriptio longi temporis*) was admissible, and eventually the term *praescriptio* came by metonymy to signify the limitation itself. Under Justinian *usucapio* and *praescriptio* were assimilated in usage (although strictly the former applied to movables alone), and the joint concept prevailed throughout the empire. *Praescriptio longi temporis* represented a limitation of from ten to twenty years for immovables, and *praescriptio longissimi temporis* thirty or forty years; the two periods later became known respectively as ordinary and extraordinary prescription.

The canonists appear to have taken over the

Justinian law of prescription in so far as it was needed for their purposes but to have stressed the element of *bona fides* and the effect *in foro conscientiae*. Using the extraordinary prescription concept and certain references in the Digest to prescription whose origin extends beyond memory, the canonists devised what became known as immemorial prescription, dispensing with a specific period. Thus they raised a conclusive presumption of ownership and afforded a supplementary method of acquisition available when no shorter period was stipulated. This device played a large part in the development of feudal law.

The doctrine of immemorial prescription developed as a customary institution in French law. There extinctive prescription of thirty years was transformed by custom into *usucapio* and given precedence over ten or twenty years' prescription, the conditions of which were rather difficult to meet. By the sixteenth century the Justinianian concept of prescription appears in the *coutumes*. That of Paris, compiled by 1510 but existing in written form far earlier, embodied the concept with all its requisites except prescriptibility. The provisions of the *Code civil* are little more than an amplification of those of the *coutume*.

Before the end of the mediaeval period English law like the French and the feudal (from both of which it drew) took over immemorial prescription and its resulting presumption that a grant had been made before the time of legal memory. This had a profound influence upon rules of pleading and proof. Where such a prescriptive title was alleged, no inconsistent one could be pleaded without traversing (denying) the first. Later the claimant to such a title might plead a grant which had been lost and support it by proof of twenty years' user. This culminated in the doctrine that such proof raised the presumption of a grant; hence the courts often spoke of the statute of limitations as a statute of presumptions. But the later tendency of English thought is to regard this as a fiction which has outlived any usefulness it may have had. The courts now apply the statute on grounds of public policy rather than by reason of any presumption that the claim is unfounded. An exception exists in acts embodying the Torrens or similar systems of registering land titles, which usually provide or are construed to mean that ownership of the registered land may not be acquired by prescription; although under certain British decisions that mode of acquisition must

be expressly excepted. As regards other rights than those of property limitation and prescription usually coincide, and even in questions of limitation a claimant who loses his remedy virtually loses his right. In the words of Pollock and Maitland "every acquisition of seisin, however unjustifiable, at once begets title of a sort, title good against those who have no older seisin to rely upon."

Limitation of action in reference to crimes also has its origins in very early practise. The notion that offenders must be punished, if at all, within a reasonable time after committing their misdeeds, appears intimately connected with various provisions for the restriction of self-redress. Among the earliest of these is the severer punishment permitted when the offender is caught red handed. According to the Twelve Tables a thief caught under such circumstances could be slain or scourged and turned over to his victim; otherwise the owner was limited to an action for damages. Traces of the same notion are seen in the rule of "hot pursuit," during which the accused may be visited with the most extreme penalty, and in the Lombard restriction of private vengeance to one year, after which the king must fix the punishment. Under Justinian *crimina publica* had to be brought within twenty years, with exceptions for apostasy, for parricide and for substitution of offspring, and with shorter periods for specific offenses. Canon law looked with disfavor upon immunity not resulting from ecclesiastical absolution; it emphasized the element of moral guilt. The Roman notions reappeared in mediaeval Italian law, but the French *Code d'instruction criminelle* was the pioneer in reviving the full Roman idea. It provided a prescriptive period of ten years for the prosecution and twenty for the penalty, in case its execution was delayed after sentence. Other codes of criminal procedure and penal codes have adopted similar provisions. There is no general limitation of prosecutions or penalties in English law, although for special offenses, such as treason, embezzlement, larceny and smuggling, an indictment must be found within a specified time. Most of the states of the United States as well as the federal government have statutes providing limitations for virtually all offenses, with the general exception of murder. As a whole modern legislation proceeds on the theory that the interests of society are best served by requiring criminal prosecutions to be brought within a reasonable time or not at all; and that nothing substantial is gained by keeping

an accused person or a suspect in long suspense.

Probably no limitation has operated uniformly as to all persons. In the Twelve Tables the mancipable property of a woman under tutelage was not subject to *usucapio* unless it had been delivered with her tutor's authorization. At a later time all those under tutelage were during its continuance exempt from *usucapio*. In the modern law the statute does not run against minors or the *non compos mentis* or in favor of those absent from the jurisdiction. Bracton for the first time in English law announced the broad rule *nullum tempus occurrit regi*, which still applies to all claims of the crown save statutory exceptions regarding realty. In republican countries the government and sometimes "the public" is substituted for the crown. The exemption is not available, however, without express enactment, to subdivisions of the state, such as municipal corporations.

For *usucapio* and prescription in the original sense, property, naturally tangible, was the sole subject matter. But the Twelve Tables recognized marital rights resulting from *usucapio*, and something of the sort existed in the early English law. Under Justinian a slave enjoying liberty in good faith for twenty years became free; a similar practise prevailed in the English and later Lombard systems. Under the *Forum judicum* fugitive slaves, even if belonging to the crown, could not be returned to servitude after fifty years. But Charlemagne denied the benefits of prescription to a fugitive slave and the inhibition extended to others through Germanic and feudal law. *Usucapio* of movables was recognized in the Twelve Tables but was not incorporated in the older Germanic law. In France the later Roman *usucapio* of three years did not become applicable because the reclaiming of movables was never permitted. After the fourteenth century a thirty-year prescription came to be established for movables.

From a very early period certain property has been treated as imprescriptible. Under the Twelve Tables stolen property was imprescriptible and also tombs, the latter affording later the nucleus of imprescriptible *res sacrae et religiosae*. A slave could not be acquired by prescription in early English and later Lombard law. The provision in the Twelve Tables which exempted from *usucapio* the five-foot space between neighboring fields was the forerunner of a rule which applied not only to highways but to public property in general. According to Gaius *usucapio* was not applicable to provincial soil

("since it belongs either to the Roman people or the emperor") or to a city's walls and gates. Justinian's Institutes makes imprescriptible the *fiscus* except when left by an heirless decedent. Taxes were never prescribed. Under modern law both civil and English public property is imprescriptible, but not the state's patrimonial property.

To acquire rights by prescription one must have possession, which in a legal sense includes physical control. By both civil and common law possession is either natural (actual) or civil (constructive) and the latter suffices prescriptively in each system. By both also the possession must be open and notorious. A clandestine possession confers no rights on the possessor because it affords no warning to the owner. The Twelve Tables imply, if they do not expressly state, the rule that *usucapio* requires continuous and uninterrupted possession for the prescribed period, for it is held that the wife's absence during three nights of the year prevents the acquisition of marital rights by *usus*. Justinian restates the rule and it reappears in both of the principal modern systems. This does not mean, however, that the same individual must continue in possession. Early Roman imperial legislation enabled an individual to claim the benefit of his grantor's possession, while Justinian gave the same effect to that of any predecessor. Such is the basis of the doctrine of "tacking," now generally prevalent. The Roman *Lex julia et plautia* forbade *usucapio* of property acquired by violence, and the doctrine was developed by the praetor; Justinian even made forcible recovery of one's own property a ground for losing it. English law goes less far but does require peaceable possession. Finally, possession must be adverse and exclusive, although if acquired by an agent or tenant it accrues to the principal's benefit. In the Roman law and its offshoots the possession usually must begin in good faith; that is, the possessor must believe himself the owner. The rule in the Twelve Tables forbidding *usucapio* of stolen goods was extended even to an innocent purchaser; but where the original possessor acted in good faith, a successor's knowledge that the property was another's did not affect the former's claim. Under the *Partidas*, *bona fides* was not required at all in case of thirty years' possession. The canon law deemed *bona fides* more important and insisted upon its continuance throughout. English law, on the other hand, does not require that the beginning of the user should be *bona fide*.

Under the law of Justinian the possessor for

ordinary prescription must have *justus titulus*—he must have acquired by one of the recognized modes of transferring ownership; if the transfer was in some way defective, possession with the other requisites might cure it. In the modern civil law the required "just and proper title" usually means a document purporting to transfer ownership. There is no such requirement in Anglo-American law. But the later Roman law likewise recognized extraordinary prescription by which in a longer period ownership could be acquired without any of the recognized modes of transfer. This also appears in the modern civil law.

The duration of the period of limitation varies greatly. In the Twelve Tables the longest period required was two years (and that for immovables only), which was reduced to one for a decedent's land not yet occupied by the heir. The praetor in a dispute over a movable granted an interdict to the possessor for the greater part of the preceding year, and a year was the first period of limitation which the praetor introduced. Constantine prescribed forty years for acquiring ownership; Justinian required three years for movables and ten for immovables or twenty if the parties were absent. Extraordinary prescription required thirty and sometimes forty years. The *Forum judicum* adopted the period of thirty years as to actions but required fifty for ownership; while the *Partidas* in taking over the limitations of Justinian has been followed generally by the modern civil law codes. The earliest English statute of limitations fixed thirty and fifty years for actions involving realty. In the statute of 21 Jac. I the period was twenty years for real property actions, six for contractual and four for tortious, except for slander, which was two. The shorter period for the latter two indicates a purpose to discourage litigation upon such grounds and to permit it only while the grievance is fresh. American state legislation, which generally follows the statute of 21 Jac. I, is restricted by constitutional provisions and must always provide a reasonable time for utilizing the remedy.

In civil matters the period begins to run when the party entitled to relief could have instituted his action; a legislative attempt to start it earlier was declared inoperative (*Webster v. Cooper*, 55 U. S. 14 How. 488). If the right is conditional the condition must have occurred, and where a demand is necessary the period runs therefrom. In penal matters under the continental system the period for prosecutions begins to run from the commission of the offense or from the last of several successive acts constituting it.

This is also the American rule. For penalties the period runs from the date of conviction.

In regard to the interruption of the prescriptive process there has been great variation in practise. Justinian fixed a longer period of limitation where one of the parties was absent from the province, and the principle is retained in the modern civil law. Formerly in England the right of action accrued so as to start the running of the statute only as to one "within the realm" and "out of prison"; but these exceptions have been repealed. Absence of the defendant from the jurisdiction will generally suspend the statute as to him. Under Justinian prescription did not run against those below the age of puberty. English law subjected to the running of the statute only those "of full age, of sound mind . . . and, if a woman, unmarried." American legislation generally makes absence of either of the first two a ground for suspending statute. In the Roman law the period was interrupted by an acknowledgment of liability on the part of one claiming the limitations benefit. In modern English law there must be a promise to pay the debt, either unconditional or accompanied by a showing of performance of the condition, or an acknowledgment from which a promise may be implied. The institution of proceedings by the claimant constituted what was known in Roman law as a civil interruption, and the concept has been retained in the two modern western systems.

LIMITATION OF ARMAMENTS. The importance of the limitation of armaments in furthering the cause of international peace has long been recognized. A nation in a state of industrial and military preparedness is much more willing to employ the processes of international adjudication in settling a dispute than a nation that has built up a powerful military machine eager to secure the initial advantage of striking the first blow. So long as the reduction of armaments does not take place, no machinery for the pacific settlement of disputes can be effective. Moreover the reduction of armaments would involve saving of enormous sums—sums which might well be used for more productive purposes.

Despite the economic burden of maintaining large military establishments no great power has been willing to run the risk of unilateral disarmament. The attitude of such a power toward disarmament whether unilaterally or by treaty is affected by the internal presence of munitions industries and military establishments. In the past at least some governments have desired to expand their navies as one means of increasing their foreign trade.

Theoretically, however, governments since the World War have expressed a willingness to reduce armaments by treaty provided the reduction would leave the relative security of each power unimpaired. Any limitation treaty removes or at least limits competition and uncertainty concerning armament levels and hence should add to the security of each power. Once achieved, the limitation of armaments even at a high level introduces a stabilizing factor into world politics and paves the way for genuine reduction in the future.

As early as the conclusion of the Seven Years' War and the Congress of Vienna attempts were made to secure limitation of armaments by treaty. The attempts failed, as did the efforts of the French government in 1831 and 1863. The initiative was taken next by the czar Alexander, who in his famous invitation to the First Hague Conference of 1899 stressed the oppressive burden of armaments and proposed that an agreement should be made providing for the "non-augmentation" of the armies, navies and war

budgets of the respective powers for a term of years to be agreed upon. This proposal was too advanced, however, and the Hague conference could do no more than pass a resolution stating that the "restriction of military charges, which are at present a heavy burden on the world, is extremely desirable for the increase of the material and moral welfare of mankind." The conference also passed a *vœu* that the governments examine the "possibility of an agreement" limiting armaments and budgets in the future. The Hague Conference of 1907 in addition to reaffirming the earlier resolution declared that "inasmuch as military expenditure has considerably increased in almost every country . . . it is eminently desirable that the Governments should resume the serious examination of this question." The rivalry between the Entente and the Triple Alliance, which led to the World War, prevented any such examination.

The experience of the World War led to renewed attempts to place some limitations on armaments. The Treaty of Versailles imposed drastic disarmament upon the defeated powers; it also declared (art. 8) "that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international obligations" and entrusted to the Council of the League of Nations the task of drawing up plans of reduction, which should be subject to reconsideration at least every ten years. Members of the League also undertook to interchange full and frank information as to the scale of their armaments and military programs.

The first concrete steps toward realizing a general arms limitation were taken, however, not by the League but at the conference convened by the United States in Washington on November 12, 1921, which considered also important political questions dealing with the Orient. At the beginning of the sessions the American delegation proposed a drastic reduction in navies with regard for existing naval strengths. On February 6, 1922, the British Empire, the United States, France, Japan and Italy—the five naval powers invited to the conference—signed a Treaty for the Limitation of Naval Armaments which was duly ratified and entered into effect on August 21, 1923. The effect of this agreement was roughly to establish parity in capital ships between the British Empire and the United States, with corresponding ratios of strength for the other powers.

The Washington treaty provided that between 1923 and 1931, when replacements might begin, the status of the battleships of the five powers should be as follows:

| | CAPITAL SHIPS | TONS |
|----------------|---------------|---------|
| British Empire | 20 | 558,950 |
| United States | 18 | 525,850 |
| Japan | 10 | 301,320 |
| France | 10 | 221,170 |
| Italy | 10 | 182,800 |

The British Empire was allowed a somewhat larger tonnage and number in capital ships than the United States because a majority of its ships were of an older type, while the American vessels were superior in gun power. The acceptance of these figures meant a reduction by the British Empire, the United States and Japan of about 40 percent of their capital ship strength, built and building. Altogether seventy ships, built and building, were scrapped, the United States surrendering the most, thirty vessels of 820,540 tons. Neither France nor Italy was asked to scrap any existing tonnage because of the relatively small strength of their capital ships.

It was further agreed that replacements might begin in 1931 and proceed so that by 1942 the capital ships of the five naval powers would be as follows:

| | CAPITAL SHIPS | TONNAGE | RATIO |
|----------------|---------------|---------|-------|
| United States | 15 | 525,000 | 5 |
| British Empire | 15 | 525,000 | 5 |
| Japan | 9 | 315,000 | 3 |
| France | 5 | 175,000 | 1.67 |
| Italy | 5 | 175,000 | 1.67 |

The size of each new ship was limited to 35,000 tons and its guns to sixteen-inch caliber. The treaty also limited total tonnage in aircraft carriers to 135,000 each for the United States and the British Empire, 81,000 tons for Japan and 60,000 tons each for France and Italy. Finally, it was provided that in 1931 the United States might arrange for a conference to consider desirable changes in the treaty to meet possible "scientific and technical developments." The Washington treaty was to remain in force until December 31, 1936; and in case none of the contracting powers should have given notice two years before that date of its intention to terminate the treaty, it was to continue in force until the expiration of two years from the date on which a notice of termination was given. Within one year of the date on which a notice of termina-

tion should take effect, all the contracting powers would meet in conference.

Although the Washington conference thus limited the number of capital ships and aircraft carriers it failed to limit the number of the lighter and faster auxiliaries, such as cruisers, destroyers and submarines, which some naval experts now consider more useful than battleships. Others hold the battleship to be an obsolete arm, expensive beyond its worth, useful only for fighting other battleships and the easy prey of the submarine and the airplane. Originally the United States proposed a limitation in cruisers and destroyers substantially on the same ratios as adopted for capital ships. The French delegation, however, declared that it could not accept the subordinate position in regard to light cruisers, destroyers and submarines which it had accepted in capital ships, on the ground that these cheap and effective arms are peculiarly the weapons of the smaller naval powers. France demanded a minimum of 90,000 tons of submarines, which equaled the combined submarine tonnage for Great Britain and the United States. In view of its peculiar susceptibility to submarine attack the British government declined to sign any treaty authorizing this large submarine tonnage for France or to consider any limitation on auxiliary vessels capable of dealing with submarines.

Nevertheless, the conference concluded a treaty (which France did not ratify) recognizing "the practical impossibility of using submarines as commerce destroyers without violating . . . the requirements universally accepted by civilized nations for the protection of neutrals and non-combatants." Any person violating the principle of international law that merchant vessels cannot be seized without warning or sunk without providing for the safety of passengers and crews was made liable to punishment "as if for an act of piracy."

Following the Washington conference a new naval competition arose among the great powers in the building of non-treaty vessels, particularly the 10,000-ton cruiser carrying eight-inch guns. By the beginning of 1927 the British government had actually laid down thirteen of these large cruisers, while Japan had built four, France three and Italy and the United States each two. The British had taken the lead in this construction in an attempt to regain their pre-war cruiser strength, which had been reduced from 114 in 1914 to fifty-six in 1921.

Meanwhile in September, 1925, the Council

of the League of Nations had established a Preparatory Commission for a Disarmament Conference. During sessions of the commission in 1926 and 1927 a basic difference arose between the Anglo-American group, which believed that naval limitation could be arrived at independently of land limitation and that naval limitation should be made by categories, and a group headed by France, which contended that land and naval armament were interdependent and that as far as naval disarmament was concerned the principle of global tonnage should be followed, each state remaining free within the general limitation to allocate tonnage between different types of vessels as it chose. France, not wishing to build capital ships because of their heavy cost, preferred to concentrate tonnage in light cruisers and submarines. The Anglo-American powers opposed global limitation on the ground that it would lead to a continuance of competition within the general tonnage figures. When agreement appeared impossible, President Coolidge took the initiative in calling a conference at Geneva to achieve the limitation of naval auxiliaries. His invitation was accepted only by Great Britain and Japan.

The Geneva naval conference convened in June, 1927. After an acrimonious debate it broke up on August 4 without having arrived at any agreement. The reasons for failure were the insistence of the British government upon the right to maintain seventy cruisers, a figure which the United States did not wish to have to equal in order to achieve parity, and the insistence of the United States upon retaining freedom to maintain large cruisers with eight-inch guns, which American naval men considered necessary because the United States' lack of naval bases compels long cruises without refueling or supplying. The British with bases scattered about the world prefer to concentrate on larger numbers of lighter vessels. The failure of the Geneva conference inevitably exacerbated feeling between Great Britain and the United States, and efforts to find a formula in the famous Anglo-French compromise of July, 1928, to which the United States was not a party, made matters worse.

With the advent of President Hoover to office the United States made another effort to secure naval limitation through the League Preparatory Commission. In a series of conversations in October, 1929, between President Hoover and Prime Minister MacDonald of Great Britain a basis was laid for an agreement upon the cruiser

question: the principle of parity was accepted by both governments and agreement was reached as to a method of defining parity.

The London Naval Conference, attended by the United States, Great Britain, France, Italy and Japan, was convened in London on January 21, 1930. After three months' negotiation a naval treaty was signed which not only amended certain provisions of the Washington treaty of 1922 but also provided for the limitation of all auxiliary craft belonging to the United States, Great Britain and Japan. So far as battleships are concerned, the three latter powers agreed to postpone the date for the laying down of new battleships from 1931 to 1936, thus creating a five-year holiday. They agreed also to scrap or otherwise dispose of a total of nine battleships within thirty months. Finally, the three powers agreed to limit tonnage for cruisers, destroyers and submarines as follows:

| | UNITED STATES | GREAT BRITAIN | JAPAN |
|------------|------------------------|---------------|-------|
| | (In thousands of tons) | | |
| CRUISERS* | | | |
| a | 180.0 | 146.8 | 108.4 |
| b | 143.5 | 192.2 | 100.5 |
| Destroyers | 150.0 | 150.0 | 105.5 |
| Submarines | 52.7 | 52.7 | 52.7 |
| Total | 526.2 | 541.7 | 367.1 |

* "a" includes cruisers with guns of more than 6.1 inch caliber.
 "b" includes cruisers with guns of 6.1 inch caliber or less.

This formula was designed to give parity in auxiliary vessels between Great Britain and the United States. For although slightly larger tonnage is allotted to Great Britain than to the United States, the latter government is authorized to maintain a superior number of large cruisers.

The London naval treaty was unable to impose any restrictions upon the size of the auxiliary fleets of France and Italy because of Italy's demand for parity with France and France's refusal to accept it. The possibility therefore remained that France and Italy as a result of competition would expand their fleets so as to menace particularly in the Mediterranean Sea the position of the British navy, now limited by the London treaty. To protect against such an eventuality the treaty contains a safeguarding clause under which each of the three signatories is given the right to exceed the tonnage levels established for cruisers, destroyers and submarines if in its opinion new construction

by non-treaty powers affects the requirements of its national security. In case one party invokes this clause the other two parties are free to make a proportionate increase in their own tonnage. Independent Franco-Italian conversations after the conference were equally ineffective by May, 1932, in securing an agreement between these two countries.

As a result of the Washington and London conferences the capital ships and aircraft carriers of the five leading powers are limited by treaty, while every category of war vessel in the three leading navies of the world is limited. This is something of an achievement. On the other hand, the cruisers, destroyers and submarines in the French and Italian navies remain unlimited and the levels at which the navies of the three leading powers are fixed are unduly high. To build the navy authorized in the London treaty the United States would have to expend nearly a billion dollars over five years. Finally, competition still remains possible even in the case of vessels limited by treaty. This fact was vividly demonstrated with the launching of the *Deutschland* by the German government in May, 1931. This so-called "pocket battleship," having a displacement of 10,000 tons, a speed of twenty-six knots and a cruising radius of 10,000 miles and carrying eleven-inch guns, meets all the technical requirements of the limitations imposed by the Treaty of Versailles; nevertheless, it is considered by some experts to be as powerful as many battleships of much greater tonnage. Apparently the only means of preventing the development of such new vessels is by meticulous definition of the specifications of the types limited.

Within the two other major branches of armaments—land and air—no limitation agreements have yet been concluded. Nevertheless, as a result of the six sessions of the League Preparatory Commission for the Disarmament Conference between May, 1926, and December, 1930, a draft agreement covering all types of armaments was concluded and placed before the conference called by the League Council for February, 1932. This provided a skeleton agreement but did not contain the figures at which armaments should be limited. The draft treaty provided for the limitation of (1) personnel in military, naval and air forces; (2) airplanes by number and horse power; and (3) total annual expenditure on land, naval and air forces. The supervision of the treaty was to be entrusted to a Permanent Disarmament Commission. The draft treaty con-

tained no provision for the limitation of land material, such as types of machine guns and rifles, nor did it attempt to fix the respective military strengths of each power. Moreover this treaty also excluded from limitation so-called trained reserves.

The problem of limiting land armaments is for a variety of reasons far more intricate than that of limiting navies. There are only a few types of naval vessels and these types are common to all naval powers. In the case of armies, however, two conflicting systems of recruiting are followed: the conscription system and the professional army system. The majority of the countries of the world employ the conscription system, under which all young men reaching a certain age are obliged to perform a period of military service. Upon the completion of this period of active training they return to civilian life but form part of a trained reserve liable to be called to the colors in case of any emergency. Other countries, notably England and the United States, follow the professional system, in which armies are voluntarily recruited for comparatively long periods of time. While this system may produce a highly efficient and mobile professional force it does not build up any trained reserves. In 1914 England could mobilize only 733,500 trained men in comparison with 3,580,000 mobilized by France under the trained reserve system. Germany in the same year was able to increase its army from the peacetime strength of 761,000 to a war strength of 5,000,000. The peace treaties required Germany and its former allies to abandon conscription in favor of the system of professional armies. Europe today therefore employs two different military systems; and for the purpose of a limitation agreement it is extremely difficult if not impossible to find a common denominator by which they may be compared. A limit on the number of men under arms at any given moment as established by the draft treaty means very little while trained reserves are excluded from limitation, unless the annual contingent of recruits is put under control.

As was demonstrated by the phenomenal development of machine guns and tanks during the World War, warfare is becoming rapidly mechanized; and an effective limitation agreement cannot therefore ignore the problem of material. Recognition of its importance led to the inclusion in the Treaty of Versailles of clauses prohibiting Germany from using large guns, tanks, military aircraft and submarines.

The obstacles confronting the limitation of material are formidable. The first is created by the problem of trained reserves. Nations following the conscription system cannot accept the same limitation upon material as nations maintaining professional armies, without automatically disarming their trained reserves. Secondly, no limitation of material can be effective if during times of peace governments are allowed to organize industrial establishments capable of turning out armaments and munitions in enormous quantities once war breaks out. If in one of two states which have agreed to maintain an equal number of tanks private enterprise manufactures as many tanks as it likes, the official tank limitation becomes illusory. A League of Nations committee has studied the question of limiting the private manufacture of arms; but so far no convention on the subject has been drafted. Such an achievement would be doubly useful, for if a method were found of restricting the profits of armament manufacture, one of the forces opposing effective limitation of arms would disappear.

The popular view that any highly industrialized nation can turn out munitions in wholesale fashion following the outbreak of war was disproved by the experience of Great Britain and the United States during the World War. Unless a policy of industrial preparation is deliberately adopted, there is a "conversion lag" of several years before a nation can be converted from a peacetime to a wartime basis. The object of any limitation treaty should be to extend this conversion lag and to prevent nations from adopting a policy of industrial preparedness. The armament establishments of each army must be limited and the manufacture of arms, whether by government or private enterprise, made to conform to this limitation. The draft treaty providing only for budgetary limitation of annual expenditures on arms is rendered largely ineffective by its failure to touch the material question.

Moreover an effective treaty must deal with the problem created by new inventions. Even should an agreement limiting the main existing types of arms be concluded, the balance would be upset and competition resumed if one nation invented a new weapon of war. Authorities such as Major Victor Lefebvre insist that it is only infrequently that new instruments of war are the by-product of industrial peacetime research. Rather they are the direct result of conscious military research, and moreover to convert an

inspired flash of discovery into a proved weapon active development is usually required. In other words, few military inventions would be made if governments abolished their military research laboratories and if the great international scientific organizations pledged their members to devote themselves to peacetime activities and to refrain from perfecting new devices for taking human life.

In the important field of chemical warfare the draft treaty provides for abstention from the use in war of asphyxiating, poisonous or similar gases and of all analogous liquid substances or processes. Bacteriological methods of warfare are to be unreservedly abandoned. Opinions differ whether the use of poison gas is less humane than the use of bayonets and bullets. Moreover it may be doubted whether a government which violates its obligation not to engage in aggressive war will observe an agreement not to use poison gas. It is also to be doubted whether a nation fighting in self-defense should be denied the use of any weapon deemed necessary to resist aggression.

Despite the obligation of article 8 of the Covenant of the League of Nations, which requires League members to exchange "full and frank information" as to the scale of their armaments, the majority of governments represented at the League Preparatory Commission declined to admit the principle of publicity in regard to material. Even should a government accept limitations upon material, it would be difficult without some form of international supervision to prevent it from evading treaty restrictions. Yet as the case of the interallied commissions in Germany showed, outside investigation into such questions may arouse intense ill will. All that the League draft treaty proposes is that any party may lodge with the Disarmament Commission a complaint that another party is violating or endeavoring to violate the obligations accepted in the disarmament treaty. The commission is to report on the subject but is given no authority to decide the dispute.

Even where agreement has been reached that effectives, including trained reserves, material and military expenditure, should be limited, there remains the fundamental problem of fixing the comparative military strength of each nation—the question of ratios. A theoretical basis for the solution of this problem was presented to the League Temporary Mixed Commission on Armaments in 1921 by Lord Esher. It proposed to limit the unit size of armies in each country to

30,000 men and to determine the number of units for each country by its population, industrial strength and strategic needs. Thus it was proposed to give France six units and Italy four. Because of the difficulty in deciding how many units each state should have, the plan failed of adoption.

Fearful of the superior industrial strength of Germany, the French representatives at the League Preparatory Commission advanced another theory, that of war potential. Under this theory a nation having an inferior war potential, or industrial capacity, should be given a correspondingly larger military force. The theory of war potential was based upon the unsound view that a nation having large industrial resources may convert them immediately to warlike purposes: it was the French army that stemmed the German invasion in 1914—not the superior war potential of Great Britain.

The two most practicable methods of fixing ratios are: first, upon the basis of the status quo; secondly, upon the basis of equality for the great powers. The insuperable difficulty with the first method is that some nations are unwilling to freeze the status quo. The application of this principle in 1914 would have meant the perpetuation of the supremacy of the British navy, which the United States would not accept; the application of the principle today would mean the perpetuation of the supremacy of the French army and air forces, which Germany and Italy will not accept.

The other alternative presents almost as many difficulties. If due allowance is made for the military needs of the French and Italian colonies, it is conceivable that at some time in the future France, Germany and Italy will admit the principle of equality in effectives and material. So long, however, as the political problems of Europe remain unsolved, so long as France fears that Germany wishes to upset the peace settlement of 1919, it will refuse to surrender its present military superiority. On the other hand, Germany is not likely to be satisfied with equality with France when a policy of alliances virtually places the armies of Belgium, Poland, Czechoslovakia, Rumania and Yugoslavia under French command. Naval limitation was achieved at the Washington and London naval conferences only after political confidence between the American, British and Japanese governments had been established. Similarly the fundamental question of limiting land armament cannot be solved until there is a reconciliation between France and

Germany and until international organization has been strengthened so as to provide each state with "security" against attack.

Realizing the difficulties of reaching an agreement according to the principle of either the status quo or equality, the World Disarmament Conference, which opened at Geneva on February 2, 1932, considered several new proposals. Here about twenty-eight governments supported the total abolition or the restriction of so-called aggressive weapons. It was argued that if weapons such as tanks could be abolished defensive fortifications and weapons would be strong enough to prevent invasion. Thus the abolition of aggressive weapons would automatically reduce the likelihood of aggressive war. Moreover this step would make possible an immediate saving in military expenditure, and it could be taken without attempting to solve the troublesome question of ratios. Opponents of the proposal declared, however, that it was impossible to distinguish between offensive and defensive weapons. During the Geneva debates the small powers contended that the battleship was "aggressive" and the submarine "defensive," the United States and Great Britain taking exactly the opposite position. It is stated also that a country called upon to defend itself must at some moment undertake a counteroffensive and that the only result of abolishing tanks and heavy artillery would be to prevent any decision and convert every war into an intolerable stalemate, entailing unnecessary loss of life. Moreover France could not abolish tanks and heavy artillery without at once reducing its superiority over Germany, since these weapons were denied to Germany by the Treaty of Versailles.

As its contribution to the disarmament conference the French government proposed the establishment of an international police force. The plan called for the establishment of an international civil air service to operate under League control all commercial airplanes above a certain tonnage. Likewise it called for the establishment of a small League army to be supplemented in time of need by national contingents. Finally, bombing planes would be exclusively in the hands of a League air force, while other "aggressive" weapons would be placed at the League's "disposal."

The French proposal to internationalize civil aviation had much to commend it. Under existing circumstances it seems impossible to limit military aviation because of the ease with which commercial airplanes may be converted for

military purposes. The creation of an international aviation company would meet this difficulty. Such a company would be interested not in advancing the ends of any government but in advancing commercial aviation in time of peace as well as war.

The other features of the project were a logical development of the principle of sanctions already embodied in the League Covenant. Nevertheless, in the present stage of international relations the French proposal is regarded by most governments as wholly impracticable. There is a danger that if an international police force is established before the system for pacific settlement of disputes is perfected, the force will become a means of perpetuating an unjust status quo and will fall under the control of a single power.

So far no proposal for the drastic reduction of any kind of armaments has met with success. This failure has been due largely to nationalist mistrust. A changed psychology will do something to remove this mistrust, but in the last analysis it is doubtful whether a new attitude toward this subject can be engendered until a world community perfecting new procedures and establishing new traditions has been developed. It would be a grave mistake, however, to abandon the present effort at disarmament until a world community has been established. Both developments must go hand in hand if either is to achieve success.

LINCOLN, ABRAHAM (1809-65), president of the United States. Abraham Lincoln, born in a Kentucky log cabin, was carried by the course of the westward movement across the Ohio River through Indiana and into central Illinois. His memory, however, long lingered fondly over his early days in Kentucky: "my state" he called it as late as 1856. Because of his humble origin the appeal of the frontier democracy which had elevated Andrew Jackson to the presidency should have gripped the young Illinois rail splitter. Yet thrown into political associations and soon into social contacts with a group to whom he proudly referred as "us Kentuckians," Lincoln chose to follow the standard of Henry Clay and to join the heterogeneous opposition which shortly became the Whig party. Even before it advanced positive principles or a definite program this party represented the combined forces of the propertied elements of the north and south, together with the traditions of wealth, intelligence and social standing. It was not at all surprising therefore that in 1843 when Lincoln was seeking nomination to Congress he was characterized by his political opponents as "the candidate of pride, wealth, and aristocratic family distinction."

Lincoln was early aroused by the inhumanity of the slave trade if not of slavery itself, but as he once said: "I bite my lips and keep quiet." He condemned the abolitionists as agitators who actually endangered the cause of freedom. During 1847-49 he served a single term in Congress, where he was active among the Wilmot Proviso foes of slavery extension; yet this did not prevent him from joining with a group of southern Whigs to name for the presidency General Taylor, who was a slaveholder, or from ridiculing the Free Soil party as being, like the Yankee peddler's pantaloons, "large enough for any

man, small enough for any boy." Even in 1854 when the Republican party was being created, he carefully held aloof from the movement and proclaimed the dying Whig remnant the true anti-Nebraska party. But by 1856 he had acquiesced in the inevitable and he took a prominent place in the Republican ranks. Meantime in his retirement from active politics Lincoln had been pondering the ethics of slavery and was becoming alarmed at the menace to "the white man's charter of freedom" which emanated from the ultra proslavery view that slavery was the normal status of the working classes. His "House Divided" speech delivered in 1858 sounded a warning of this danger. Nevertheless, he won the Republican nomination in 1860 because of his conservative views on slavery and was described by Alexander H. Stephens during the campaign as "just as good, safe and sound a man as Mr. Buchanan."

Both before and after his election Lincoln offered every reasonable guaranty to slavery as it existed in the southern states, but the Republican victory of 1860 was interpreted by the south as a sign that its peculiar institution was shortly to be attacked. The war which followed Lincoln envisaged as a conflict between two concepts of the role of labor. He had frankly declared his preference for a system "under which laborers can strike when they want to." He resented "the effort to place capital on an equal footing with, if not above, labor, in the structure of government." Southern secession constituted in effect an attack upon the rights of all working men; to him "the strongest bond of human sympathy, outside of the family relation, should be one uniting all working people, of all nations and tongues, and kindreds." There is little evidence that Lincoln foresaw the extraordinary industrial consequences for northern capital of a federal victory.

As a war president Lincoln found himself invested with dictatorial powers. Nor did he hesitate to use them. As stated in his own executive order of February 14, 1862: "He called into the field such military and naval forces, unauthorized by the existing laws, as seemed necessary. He directed measures to prevent the use of the Post Office for treasonable correspondence. He subjected passengers to and from foreign countries to new passport regulations, and he instituted a blockade, suspended the writ of habeas corpus in various places, and caused persons who were represented to him as being or about to engage in disloyal or treasonable prac-

tises to be arrested by special civil as well as military agencies, and detained in military custody. . . ." Despite these acts he sought to conciliate and control the most diverse forces. Generously disposed toward all southerners except the leaders of the Confederacy, he labored hard to please southern loyalists and at the same time to hold in check the rising tide of abolitionism in the north. More slowly than the dominant current of opinion there he moved toward a policy of emancipation. Northern Copperheadism had to be controlled; but while Lincoln permitted arbitrary arrests by important subordinates whose actions he could not afford to repudiate, he was only technically responsible for this limitation of the field of civil liberty and more than made up for this by restraining the forces which demanded the sweeping legislative and administrative suppression of freedom of speech and press. Perhaps there was no more significant item in his record than his action in revoking the order of General Burnside for the suspension of the *Chicago Times* and other papers, unless it was his wholesale release on parole of political prisoners by the executive order of February 14, 1862.

Lincoln's reconstruction policy was based essentially on the prompt restoration of the southern states to "their proper practical relation with the Union." The generosity of this program aroused the opposition of congressional spokesmen for the Republican party, who alarmed at the early readmission to Congress of the members of the seceded states before the attainment of the economic ends for which the war was being fought bluntly reminded the president "that the authority of Congress is paramount and must be respected; . . . he must confine himself to his executive duties . . . and leave political reorganization to Congress." This growing cleavage in the Republican ranks and the not unjustifiable insistence of the Democrats that the war had so far been a failure seemed to promise certain defeat for Lincoln in the 1864 campaign. The autumn, however, brought a number of notable victories in the field and Lincoln was returned to office by a handsome majority. That his reelection was likely only to complicate his problem of securing the continued cooperation of ardent northern leaders was clear from the developments of the ensuing winter and spring, when it became evident that former Copperhead critics were being attracted by his generous policy. To these and to conservative Republicans the martyred president

became "the Great Conciliator." But the northern radical Republicans, who at first could not conceal their relief at the removal of Lincoln from the helm, were soon creating the beginnings of the Lincoln myth, which credited him with a consistent and predestined devotion to the cause of abolition; by them he was proclaimed the "Great Emancipator" and thus he has remained for most Americans.

LINGARD, JOHN (1771-1851), English historian. Lingard and Hume were the earliest modern historians of England who drew their information from original sources, and Lingard was the first to tell its story with real impartiality, notwithstanding his Catholic connections. At an early age he was given a scholarship in the English Catholic College at Douai and during his stay of eleven years was thoroughly educated in the classics, modern languages, philosophy and theology. Returning to England in 1793 he was for a short time tutor in a Catholic nobleman's family and then served for some years as teacher in the newly founded Crook Hall, Durham. In 1811 he was appointed Catholic pastor in the little village of Hornby in Lancashire, where he spent the remaining forty years of his life.

The material remains of early British church history in the neighborhood of Crook Hall and Hornby drew him to the study of that subject and in 1806 he published *The Antiquities of the Anglo-Saxon Church* (2 vols., Newcastle 1806;

5th ed. London 1858). These interests combined with his desire to correct what he considered Protestant misunderstanding of his church led him to undertake a general history of England, the *History of England from the First Invasion by the Romans to the Accession of William and Mary* (8 vols., London 1819-30; 7th ed., 10 vols., 1883). His object of reconciling differences between Catholics and Protestants is recognizable through the entire work. Issued by a Protestant publisher, it was even examined for infelicities before printing by a clergyman of the Church of England. The appearance in 1819 of the first three volumes, covering the Middle Ages, established his reputation; but as each successive volume appeared, covering periods of greater controversy, the attitude of strict impartiality became more difficult to preserve; and with the appearance of the eighth volume in 1830, bringing the work down to 1688, he recognized the impracticability of continuing it along the same lines and devoted the rest of his life to successive revisions and editions of his great work, to the writing of articles and pamphlets and to correspondence on the church problems of his time.

In the deep divisions of opinion and policy among English Catholics it was to be expected that the moderate nature of Lingard's work would be offensive to many. Nevertheless, it was well received by the great body of both Protestant and Catholic scholars, and the pope himself at one time ordered two hundred copies for distribution. In the Catholic controversies of the time Lingard took little part but aided in the various efforts, culminating in the Catholic emancipation of 1829, to secure for the Catholics a better political and social position in England. The sustained impartiality and evident learning of his work, the clarity of its style and its wide popularity doubtless had much to do with the increasing liberality of popular feeling in England toward Catholics.

EDWARD P. CHEYNEY

LINGUET, SIMON NICHOLAS HENRI (1736-94), French lawyer, journalist and social theorist. Linguet, who came of a middle class family, had literary ambitions from early youth. At thirty he had already plunged deep into history, drama, verse, philosophy and politics. He had demanded reform of the legal system and of

taxation and had condemned the practise of sacrificing soldiers to make a despot's holiday. After winning the praise and support of Voltaire by his spectacular defense of some youths condemned to death in 1766 for the sole proved offense of reading the *Dictionnaire philosophique*, he became a famous lawyer admired for his eloquence and sought by distinguished clients. But in 1774 his legal career was abruptly ended by his disbarment as a result of his attack on the bench. Three years later he founded the important journal *Annales politiques, civiles et littéraires* (19 vols., 1777-92), which became a vehicle, supplementing his numerous pamphlets, for his unintermittent and versatile offensive against his contemporaries. The principal objects of Linguet's attack were the church, the rich, the economists and finally the philosophic ideal of political liberty. Keenly aware of the evils of the society in which he lived he condemned the remedies which were currently proposed. According to his political theory the state had no other object than to preserve property, defined by him as the claim of the few upon the labor of the many. Since property could originate and survive only through violence, the essence of the state was force. With vitriolic passion he flailed what he thought was the puerile idea that freedom could be won by the establishment of mere equality before the law. The *philosophes* and Anglo-manics who entertained this idea completely overlooked the real evil, which was economic inequality. But Linguet, who was analyst rather than reformer, could see no escape from the situation and pessimistically recommended passive acquiescence as the only intelligent course. His ideas were either derided or condemned as a defense of despotism. In 1780 he was imprisoned in the Bastille, from which he was released two years later under sentence of exile. During the period of his exile, the greater part of which was passed in England, he published his pungent *Mémoires sur la Bastille* (London 1783, new ed. by H. Monin, Paris 1889; tr. by S. F. Mills Whitham, London 1927) and through the *Annales* maintained a running commentary on European events. After the fall of the Bastille he returned to France, but only to be guillotined in 1794 as one who had consorted with tyrants and defended despotism.

In his perception that economic facts are more important in the life of the individual than political background Linguet was far in advance of any other thinker of his age. When in *Théorie des lois civiles* (2 vols., London 1767; new ed., 3 vols.,

Paris 1774), perhaps his most important work, he declared that men could not be really free if "they must go upon their knees to a rich man to gain from him permission to increase his wealth," he was crudely foreshadowing the doctrine of surplus value. His fame died before him, but his ideas had an important influence on Karl Marx. They are in fact more in keeping with twentieth century thought than with eighteenth. It is not surprising therefore that there are signs of re-awakening interest in Linguet.

LIPINSKY, VYACHESLAV (1882-1931), Ukrainian historian and nationalist leader. Lipinsky attended the *gymnasium* at Kiev and studied at the universities of Cracow and Geneva. Although by birth a Polish nobleman and by faith a Roman Catholic he identified himself in early youth with the cause of Ukrainian nationalism. In his first work, *Szlachta ukraińska i jej udział w życiu narodu ukraińskiego* (The Ukrainian nobility and its participation in the life of the Ukrainian people, Cracow 1909), he stressed the Ukrainian origin of the majority of the Polish nobility in the Ukraine and urged them to assume leadership in the movement toward a

Ukrainian renaissance. In 1918 he was sent by the hetman Skoropadski to Vienna as the first minister of the Ukrainian state; he continued for some time under the directorate which replaced the Skoropadski regime but, unable to agree with the political ideas of the new leadership, he resigned and spent the remainder of his life as a political émigré. In 1926 he was called to the Ukrainian Scientific Institute in Berlin, where he remained until 1928.

Lipinsky's chief claim to distinction rests on his original interpretation of the forces and ideals dominant in Ukrainian history. Departing from the traditional populist school in Ukrainian historiography, which interpreted the history of the country exclusively in terms of a continuous struggle of oppressed masses against the feudal exactions of a native and foreign nobility, he attempted to prove, first, that the recurrent uprisings of the Ukrainian masses were animated by the political ideal of the reestablishment of a Ukrainian state and, second, that the Ukrainian nobility played the most constructive part in the actual organization of these struggles. It was only after the collapse of the Khmelnytsky wars—the Ukraine's most heroic bid for political independence—that Ukrainian nobility succumbed to Polonization and Russification and the national ideal was deflected from the struggle for an independent state into the movement for cultural survival within the political boundaries of Russia, Poland and later also Austria-Hungary. It is the task of Ukrainian leaders, he insisted, particularly of the politically conscious nobility, to restore the original political ideal to the Ukrainian masses. Building upon his interpretation of Ukrainian history he evolved in his *Listi do bratv chliborobiv* (Letters to fellow agriculturists, reprinted Vienna 1929; first published in the collection *Chliborobska Ukraina*, Agricultural Ukraine, ed. by Lipinsky, 5 vols., Vienna 1920–25) an elaborate theory of the Ukrainian state, organized on a corporate basis and ruled by a monarchy based on a broad aristocracy, recruited from all classes of the people. Lipinsky's historical works were hailed by some as marking a new epoch in Ukrainian historiography, but his general interpretation and conclusions have been criticized by Hrush-evsky.

NATHAN REICH

Other works: *Z dziejów Ukrainy* (in Polish) (From the Ukrainian past) (Cracow 1912), a collection of studies edited and written largely by Lipinsky, some of which were reprinted in revised form in his *Ukraina na pere-*

lomi 1657–1659 (Ukraine at the turning point) (Vienna 1920); *Religia i tserkva v istorii Ukrainy* (Religion and the church in Ukrainian history) (Philadelphia 1925). *Consult:* Doroshenko, D., "Vjačeslav Lipinsky" in *Ukrainisches wissenschaftliches Institut, Berlin, Abhandlungen*, vol. iii (1931) 157–66, and *Ohlyad ukraïnskoï istoriografii* (Prague 1923) p. 209–12.

LIPPERT, JULIUS (1839–1909), German sociologist and historian. After receiving training in history Lippert taught in Bohemia and Germany and served one term in the Austrian parliament and several in the Bohemian legislature. His first important works were in the field of comparative religion, followed by studies in the history of the family and in material culture, the results of which he synthesized in his greatest work, *Kulturgeschichte der Menschheit in ihrem organischen Aufbau*.

Although his method and point of view align him with Tylor, Morgan, Spencer and other members of the classical evolutionist school of anthropology and sociology, Lippert anticipated modern writers in his recognition of the role of cultural diffusion and in his emphasis on the superorganic nature of culture. The determinants of cultural phenomena were to him never biological or psychological factors such as race, heredity, genius or instincts but always cultural, especially economic, factors as these are conditioned by historical and geographical influences. He assigned to ideas, particularly religious ideas, an extremely important role in cultural evolution and consistently stressed the interrelation and interdependence of social phenomena. Lippert demonstrated the economic basis and superorganic character of human marriage and shed light on the confused problem of the relation between religion and magic by his original treatment of fetishism. His work has received wide recognition and has had influence among sociologists in Germany, Russia and in certain circles in the United States.

GEORGE P. MURDOCK

Important works: *Der Seelencult in seinen Beziehungen zur althebräischen Religion* (Berlin 1881); *Die Religionen der europäischen Kulturvölker* (Berlin 1881); *Christenthum, Volksglaube und Volksbrauch* (Berlin 1882); *Allgemeine Geschichte des Priestertums*, 2 vols. (Berlin 1883–84); *Die Geschichte der Familie* (Stuttgart 1884); *Kulturgeschichte der Menschheit in ihrem organischen Aufbau*, 2 vols. (Stuttgart 1886–87), tr. by G. P. Murdock as *The Evolution of Culture* (New York 1931); *Deutsche Sittengeschichte* (Leipzig 1889); *Sozialgeschichte Böhmens in vorhussitischer Zeit*, 2 vols. (Vienna 1896–98).

sketch in *Deutsche Arbeit*, vol. v (1905-06) 25-34, tr. by A. W. Small in *American Journal of Sociology*, vol. xix (1913) 145-65.

LIPSIUS, JUSTUS HERMANN (1834-1920), German classical philologist and historian. Lipsius studied at the University of Leipsic and taught at the Nikolaischule in Leipsic from 1863 to 1877 and at the University of Leipsic from 1877 to 1914. His first writings were concerned with the Athenian orators. He revised the works of M. H. E. Meier and G. F. Schömann on Athenian legal procedures; but when Aristotle's treatise on the constitution of the Athenian state was discovered in 1891, he realized immediately that this work involved a change in the conception of Athenian legal procedures. His first efforts in this direction were contained in his revision (2 vols., Berlin 1897-1902) of G. F. Schömann's *Griechische Alterthümer*, originally published in 1855-59. His chief work, however, is *Das attische Recht und Rechtsverfahren mit Benützung des attischen Processes von M. H. E. Meier und G. F. Schömann* (3 vols., Leipsic 1905-15), which reveals a complete mastery of Attic sources as well as occasional utilization of other Greek legal data. As far as its method is concerned the book presents a commentary on the Athenian writers, particularly the orators, rather than a study of Greek law. The first volume is an introduction to the constitution of the courts of justice; the second deals with legal actions, which are classified as private and public and also in accordance with the authorities under whose jurisdiction they fall; while the third is devoted to legal procedures. The study is not concerned with the actual law or with the content of criminal and private law but rather with the question of legal actions and procedures. Actions moreover are described not from the point of view of their proper purposes but from that of competencies. As a result the work has only an antiquarian value and by no means affords an insight into the development of the legal aspect of Greek cultural life. Lipsius himself recognized this shortcoming, which reflects a lack not of ability but of proper method. In the preface to the last volume he suggested the desirability of a study of Greek rather than Athenian law, which, he maintained, should combine the methods of philology and jurisprudence.

senschaft zu Leipsic, Philologisch-historische Klasse, Berichte über die Verhandlungen, vol. lxxiii (1921) 41*-50*; Poland, Franz, in *Biographisches Jahrbuch für Altertumskunde*, vol. xlv (1924) 1-36, with full list of the works of Lipsius.

LIPTON, SIR THOMAS JOHNSTONE (1850-1931), British merchant. Lipton, who had but a few years of formal schooling, worked as a boy in his father's small provision shop in Glasgow. On his twenty-first birthday he opened his own provision shop, where from the first he applied those modern principles of merchandising then being developed in England, on the continent and in the United States: careful buying for cash, good quality, attractive display, advertising, cash sales at small profit and rapid turnover. He was a pioneer in the use of intensive advertising, including what are now called ballyhoo methods. Lipton was also the most important pioneer of the chain store system in England; as soon as his capital permitted he opened other shops in other cities, and the number of Lipton markets all financed by the reinvestment of profits multiplied rapidly in Scotland, Ireland and England. A central depot in Glasgow, later moved to London, carried on considerable manufacturing. Wherever possible the Lipton organization bought direct from producers and also, particularly in later years, produced many of its own raw materials and manufactured many of its own products. In 1898 the business was incorporated for £2,000,000 as Lipton, Ltd., the company owning in addition to retail provision shops many tea, cocoa and rubber plantations in Ceylon and factories and warehouses in London and elsewhere. Lipton was probably the most important and successful of the British merchants who applied modern capitalist methods to merchandising.

LIQUIDITY. This term when applied to an article of wealth or a credit item denotes the possibility of raising cash upon it by selling it or pledging it as security for a loan; in reference to a business concern liquidity is measured by the availability of cash, whether direct and immediate or indirect and involving the conversion of some assets into cash to meet ordinary or extraordinary demands upon it. The assumption in

both cases is that the conversion can be carried out expeditiously without sacrifice of values and with slight cost and disruption of operations. Liquidity must be clearly distinguished from solvency; a concern with assets of a current exchange value equal to or greater than its liabilities to creditors may be either liquid or illiquid, depending upon the character and distribution of its assets.

All the problems of liquidity for ordinary articles of wealth are present also in connection with liquidity of credit instruments, which can therefore best serve as the basis of a general discussion. A credit instrument may be liquid by virtue of the self-liquidating character of the transaction underlying the credit, the marketability of the collateral or the marketability of the credit instrument itself.

A credit instrument involving a sale of goods is said to be self-liquidating when it is assumed that the buyer can within the period of the credit sell the goods and thus acquire the funds necessary to discharge his debt at maturity. The principle of self-liquidation underlies the policies and practises of commercial banking. A commercial bank generally insists that borrowers' notes cover transactions or be secured by collateral which in the ordinary course of production and orderly marketing may at maturity provide the debtor with sufficient funds to repay the debt; that the margin of security be adequate to protect the bank during the full term of the loan; and that the collateral consist of warehouse receipts, bills of lading or similar documents conveying or securing title to non-perishable and readily marketable staple products or that it be a chattel mortgage or other like instrument giving a prior lien upon livestock which is being fattened for market. Of course the fact that the instrument is tied to a specific transaction does not assure its liquidation, first, because its face amount is consonant with the current price level of the commodity involved, which may be unduly inflated at the time by this and similar transactions, and, second, because its actual liquidating power rests not in the transaction itself but in the buyer's future operations or in lieu thereof in the seller's; the buyer also may meet his obligation with funds derived from an outside source and not from the sale of the goods bought. The liquidity of the instrument therefore rests ultimately upon the credit of the buyer and upon the marketability of the commodity; that is, in the ideal case upon the presence of ready markets with such frequent quotations of

price as to make the price easily and definitely ascertainable and the commodity itself easy to realize upon by sale at any time. If business conditions are stable and the purchase underlying the credit is not too speculative, the risk involved in credits of this type is small; for this reason such credits rank well in liquidity.

There is a related but different type of liquidity when the instrument is collateralized by readily salable securities but does not arise out of a sale in the ordinary course of production and marketing, does not possess a maturity related in any way to the turnover of goods and represents what is probably a speculative credit. The liquidity of such loans rests upon the organizational development of the market for the collateral; the size of the clientele of buyers and sellers, the frequency of sales and consequent continuity of market, the standardization of the commodity and of the terms of sale and the possibility of selling short and of buying and selling for future delivery and on margin. The outstanding example of such credits is the brokers' loan, collateralized by stocks and bonds in the financial center. Most brokers' loans are call loans; if change of price of the collateral jeopardizes the safety of the loan, the lender calls upon the borrower for additional collateral and, if the latter fails to comply, sells the collateral.

Another type of liquidity is based upon the possibility of the outright disposition by sale or discount of the credit instrument itself rather than of the collateral which may support it. This form of liquidity requires a highly organized market for the paper, a big purchasing fund in the hands of buyers and standardized credit instruments of convenient form and denomination. In such a market the holder may readily dispose of a credit instrument at a price equal to face value minus interest to maturity. It is obvious that liquidity of this sort results from the shifting of liabilities to other lenders and may therefore be designated as shiftability. For short term credit instruments liquidity of this type is assured by the existence of a broad discount market, generally provided by a central bank, and of acceptance and commercial paper markets, where bankers' acceptances and commercial paper issued by large and well established concerns are bought through brokers or dealers by banks or private individuals for the temporary investment of surplus funds.

While the liquidity of a business concern rests upon the liquidity of its assets, it depends more specifically upon a type of financial management

which assures the regular inflow of funds in time to meet maturing obligations. A commercial or industrial house will sell goods on such terms as will match in maturity the debts it owes for materials, supplies and the like; a bank will enlarge its holdings of paper maturing before the Christmas holidays, when heavy withdrawals of deposits are certain to occur. Thus instead of each instrument providing for its own liquidation one account, bill or note receivable matures and provides funds to liquidate a maturing account, bill or note payable. In banking usage this practise is called rotation of the portfolio.

The liquidity of an ordinary business institution rests not only upon its ability to meet obligations as they mature but also upon its possession of a reserve of assets readily convertible into cash to allow for unexpected demands. The necessity for reserve liquidity rests upon and varies directly with the variability of economic life: the presence of cyclical, seasonal and irregular fluctuations requires from time to time the conversion of assets into cash to meet fortuitous changes in economic circumstances. The problem of reserve liquidity for an agricultural, industrial or commercial concern is easily solved where it has well established banking connections; assets which it is not desirable to sell or which do not command a ready market may afford sufficient security for a bank loan to tide the concern over an emergency. A banking institution is as a rule much more vitally concerned with liquidity than is an ordinary business establishment; this is a direct outcome of the nature of commercial banking operations, in which demand liabilities are balanced to a large extent by assets of short term maturity. Moreover the liquidity of banks is vastly more important to the business community than that of its other constituents; for banks provide the mechanism which assures the smooth circulation of short term credits and serve as the central repository of liquid funds. The liquidity of its banks is an essential prerequisite for liquidity of all other business enterprise in a community; it is equally true, however, that the liquidity of the banks is based in the last resort upon the smooth functioning of the production and marketing machinery.

In general the degree of liquidity of the bank's assets should be in proportion to the probability of its needs for cash; thus the higher the proportion of demand liabilities to total liabilities, the more unstable the temperament of the community, the more homogeneous the circle of de-

positors and the larger the proportion of deposits owed to a few people or to other banks, the greater must this liquidity be. The liabilities which may cause a demand for cash differ in relative proportions as among individual banks in a country and as among the banks of countries as a whole, and the provisions for liquidity must vary accordingly. Of the two leading liabilities deposits bulk much larger than banknotes in the United States, Canada, England and Australia. In securing its liquidity an American bank is concerned therefore almost wholly with meeting deposit withdrawals. To do so the bank maintains an adequate cash reserve and selects carefully its loans, discounts and security investments. It is not necessary of course that all of these assets be highly liquid. The primary reserve, consisting of cash in vault and immediately available balances with other banks, should be sufficient to meet the probable maximum of ordinary daily net withdrawals; it should be supplemented by a secondary reserve consisting of highly liquid earning assets sufficient if liquidated to meet exceptionally large withdrawals due to season, sudden market turns or panicky runs for whatever reason. The secondary reserve may cover such items as government securities, first class listed active bonds, commercial paper and acceptances and other paper eligible for rediscount or for sale in the open discount market. Special provisions are made to meet the other liabilities: the ownership and pledge of United States bonds and lawful money to secure the immediate payment of national banknotes, the ownership and pledge of acceptable paper and securities to cover advances from correspondent banks and the Federal Reserve Bank and the pledge of collateral to support the customers' liability for acceptances executed for them by the bank.

The cardinal principle of English commercial banking as developed in practise and in the writings of its theorists was an insistence that commercial banks confine themselves exclusively to short term financing of a mercantile character and not supply fixed capital for industrial or other undertakings; it was argued that as long as a bank's assets consisted of cash and short term self-liquidating commercial paper the maturity and payment of one batch would provide funds for new loans and keep the bank's portfolio in a flexible form to meet the slight variations from time to time, and that the lending of any funds on mortgages would disrupt that smooth flow into and out of the bank and make it impossible

at times to meet demand liabilities. This doctrine, conceived at a time when bank liabilities consisted almost wholly of circulating demand notes and when securities and discount markets were young, poorly organized and undependable, became so strongly entrenched in theory and practise that it survived long after these conditions had passed and is still current at the present time. The English banks have therefore virtually no investment accounts and although they keep small primary reserves maintain a high state of liquidity through their large secondary reserves.

The American banks copied the English notion of commercial banking; the struggle to achieve liquidity through limitation of loans and discounts to short term self-liquidating paper was carried through the years by state and national systems and into the Federal Reserve, but in general it has represented an ideal impossible of achievement under American conditions for several reasons. The advances made by the thousands of local independent banks have been mainly to farmers rather than to urban distributors and in large part necessarily intermediate or long term loans secured, if at all, by growing crops, real estate or farm equipment, none of which has a ready market. The scarcity of capital under circumstances which called for the development of vast virgin resources compelled banks to extend capital loans, a practise to which they were led by the desire to make profits and by the appreciation of the duty of a bank to distribute credit in such a way as reasonably to meet the community's requirements. The prevalence of the open account, cash discount and single name paper system and the lack of a discount market made the liquidation of receivables through sale or rediscount very difficult, thus minimizing the difference in liquidity between capital and commercial loans. On the other hand, the improved organization of the securities market and the increased stability of earnings of corporate securities have raised their liquidity. In general as banks come to finance the ever widening diversity of economic activities it is impossible for them to abide by the mid-Victorian doctrines of liquidity. The portfolio must consist of a wide variety of paper and securities consonant with the "department store" type of organization and service rendered by modern banks. Banks must supply all the capital needs of an industry—for building and equipment of plant, purchase of materials and production and marketing of products; this they have been doing more and more, either directly or through affiliated insti-

tutions. On the continent the general bank has long functioned in this complete way, identifying itself closely with the institutions or industries it finances; and undoubtedly the English and American banks will gradually assume a similar role. Liquidity of the bank will thus become more involved with the stability and liquidity of the industry or industries financed.

The liquidity of one bank is generally dependent upon the liquidity of other banks in the system. Under normal conditions funds are not held idle outside of banks, and when deposited in banks they are quickly utilized in large part by loans and investment. Consequently when a bank contracts its holdings of acceptances and commercial paper, the debtor must either reduce his balance to pay off the paper or find a buyer elsewhere for a new issue to take up the old. If a bank calls its broker's loans, the broker finds another lender from whom he gets funds to pay the calling bank; if it proves necessary to liquidate the collateral, the buyer of the securities draws upon his balance, causing his bank to contract, or borrows funds elsewhere to pay for them. If a bank strengthens its cash position by borrowing from a correspondent, the latter may have to call other loans or sell securities or at least part with some liquid cash. It appears therefore that the improved liquidity of one institution may lower the liquidity of another and moreover that a simultaneous liquidation of call loans, commercial paper or other assets by all banks is impossible without sacrifice of values. In time of panic securities, both those owned and those held as collateral for loans, become unsalable in the hands of the banks; to sell would force a severe break in the market, with consequent disaster to customers and to the banks themselves. It is an interesting and significant fact that after the 1929 stock market crash in the United States the reporting member banks' loans on collateral, including both brokers' loans and direct loans to individual customers, amounted to substantially the same figure as before. In emergencies of this order it is highly advantageous if a central bank stands by with unused funds and lends freely to support the market. A basic principle of central bank policy as developed in the Bank of England is to stem panics by just such action; while in the pre-war panics in the United States the absence of such support was profoundly felt, in the 1929 panic the Federal Reserve Banks loaned freely to member banks, call loans remained liquid and interest rates did not rise above 6 percent.

In modern highly integrated banking systems the central bank is valuable as an agency assuring liquidity not only in times of panic and stress but also under normal circumstances. By rediscounting, lending or purchasing their assets from individual banks the central bank serves as the immediate or ultimate source of funds for the commercial banks of a country. In order to tap this source, however, the banks must so conduct their business as to have sufficient eligible and acceptable paper and securities and to keep their borrowings within the limit set by the central bank. The central bank, because of its public responsibility, tends to maintain a very liquid position. Its assets consist largely of gold and lawful money, the ultimate reserves of the banking system; of short term commercial paper, obtained by rediscounting for other banks or by open market purchase; and of short term government securities. The lending power of a central bank is much greater than that of an ordinary commercial bank; the only limitation upon its ability to issue notes, create deposits and rediscount or purchase paper is the danger of inflating the general price level or the securities market to a point at which the gold reserve is driven abroad or into hoarding, the reserve ratio is ominously low and a general financial collapse is imminent. Within these broad limits the central bank constitutes a defense of the liquidity of the system. Since it is a central bank extending credit to all parts of the country and to all lines of industry there is opportunity for a turnover of portfolio or the shifting of funds from region to region and from line to line as conditions require; but it need not rely upon such safeguards of liquidity, for it may freely create notes and deposits.

The extraordinary powers enjoyed by the central bank by virtue of its command of the pooled reserves of the country and of its right to issue notes do not protect it completely from the threat of illiquidity. The test of the central bank's liquidity occurs, however, not in meeting obligations in the domestic market but in responding to the call of foreign creditors in terms of the international currency, gold. Situations in which such a test cannot be withstood may be due to loans to foreign central banks or other foreign institutions which result in a continuous gold drain and become frozen; more often, however, the call from abroad upon the central bank's reserves merely reflects the position of the national economy, of whose liquidity it is the guardian, with reference to the world market.

The outcome is the abandonment of the gold standard, that is, the admission of international illiquidity, and the careful management of financial relations with foreign countries in order to attain liquidity on a new basis. It is the fear of being forced to depart from the gold standard which sometimes prevents central banks from assuring as much liquidity in the domestic markets as appears necessary. In such cases resort is had to ad hoc organizations, such as the War Finance Corporation after the World War and the Reconstruction Finance Corporation in 1932; these organizations are able to obtain long term capital funds and lend them on what would otherwise be frozen assets, thus relieving the necessity of forced liquidation and postponing payments until more favorable times.

LIQUOR INDUSTRY. The universal prevalence of alcoholic beverages in primitive African culture is sometimes explained by the scarcity and uncertainty of pure water. But the primitive Gauls and Teutons, who had no lack of good drinking water, brewed a dark beer for daily consumption. In primitive societies generally alcoholic beverages have been used variously as a common drink, in ceremonial festivals and to stimulate merrymaking. Thus the Kiwai Papuans of British New Guinea prepare a peculiarly stupefying beverage from the root of a native plant, a small quantity of which renders the drinker unfit for anything but sleep. The desert dwelling Amerinds concocted a very heady drink by chewing beans and roots in a mouthful of water, expectorating the liquid mash into a skin container and then setting the mixture out into the sunlight for fermentation. On the other

hand, some primitive African tribes brew their beer by a process of malting and mashing.

Ancient Babylonian records from the time of Sargon I depict the process of brewing beer from cereals and show plainly that beer was used as a household beverage. That the dispensing of liquor was a common practise in this ancient society is indicated in the Code of Hammurabi (c. 2100 B.C.), in which are contained decrees regulating the activities of tavern keepers. In Egypt as far back as the Old Empire the making of wine and beer was evidently common; the same was true among the ancient Hebrews, as evidenced in *Genesis* (ix: 20-21): "And Noah began to be a husbandman, and he planted a vineyard: and he drank of the wine, and was drunken . . ." Wine making was a major industry in Greek and Roman civilizations; indeed the whole Mediterranean area was almost one vast vineyard. The fragrance and taste of wines stamped their locality; wines from Lesbos, Chios, Sicily, Samos and Thrace were praised by poets and sought after by connoisseurs. Wine was a common retail and wholesale commodity and the subject matter of commercial treaties.

During the early Middle Ages beer and wine were produced for local consumption. Almost every manorial establishment had its brewhouse, while the wine presses were a source of feudal payments. The monks also were brewers and vintners. It was in the monasteries that the mysteries of the arts of brewing and wine making, which later became the basis of one of the most important handicrafts of the period, were developed. Early in the Christian era the monks had taught the primitive Gauls and Teutons to grow grapes and to ferment wine; so also they now taught the new class of craftsmen the art of wine and beer making. With the growth of the free cities and with the expansion of European trade the manufacture of alcoholic beverages became a leading industry, which was organized in the familiar pattern of the guild and town economy. Craft guilds established rules of apprenticeship, limited competition, set standards of quality and fixed prices. Merchant guilds controlled export and import trading, sought and obtained special privileges in trade centers, regulated commercial practises and as a result waxed rich and powerful. By the fourteenth century the trade in wine and beer had reached significant proportions. Thus a large part of the commerce of the Hansa cities was in beer and wine; it may almost be said that the prosperity of Hamburg was built on beer, for its alcoholic

wares even reached Asia by way of Novgorod. Wine flowed from the southern isles of the Mediterranean to the northernmost part of Europe. The beginnings of the English mercantile marine may be laid to the wine trade. After the wine merchants of Bordeaux had ceased trading in English ports because of the many restrictions imposed upon them, English merchants were forced to build their own ships to secure the wine England demanded. Duties on wine moreover were weapons in the struggle for national dominance, and eighteenth century England, for example, placed discriminatory duties on French wines in order to cripple the commercial power of its rival. Throughout Europe beer and wine were common beverages plentiful in supply and low in price.

It was during the Middle Ages too that distilled liquor was first produced. The distillation of liquids had been known to the ancient Chinese, Hindus, Assyrians and Greeks, but there is no record that the process was applied to the production of beverages. By the twelfth century, however, whisky was already in use in Ireland and probably also in Scotland; brandy appeared a little later in Spain and France; and in the fifteenth century it was brought from Italy into England and Germany. The same period also saw an increase in the number of different wine spirits. A Benedictine monk produced a wine spirit of rare taste, dedicated it to God and called it "*Benedictine, Deo Optimo Maximo*." It is interesting to note that the manufacture of whisky was one of the earliest capitalistic enterprises. Whisky distilling was made a free pursuit in England in the seventeenth century, and a discriminatory tax laid on malt and ale to encourage the consumption of spirits made from English corn created a profitable field of enterprise for whisky distillers.

Not unlike other industries the liquor industry was subjected to a superstructure of regulations. In addition to the guild rules there were various municipal ordinances and crown decrees, which, as contradictory as they were varied, reflected the interests of many political and trade groups. Some codes sought to safeguard the monopoly of the various crafts engaged in the liquor trade; others fixed trade practises and forbade technical innovations; and still others were designed for the protection of consumers. Since lords and nobles were interested in the traffic, it was natural that royal decrees should appear to add their weight to local ordinances. Such decrees usually prescribed

standards of quality, fixed prices and regulated the places of sale. Henry VII in 1495 empowered any two justices of the peace "to reiecte and put away comen ale selling in Townes and places where they shall thinke convenyent, and to take suerties of the keepers of ale houses of their gode behavyng . . ." (11 Henry VII, c. 2.). Taxation too was variously motivated, the usual purposes being to secure revenue, to make control effective and to impose discriminatory favors and disadvantages.

In modern times the liquor industry has occupied only a secondary role in the economic life of nations. In the United States, for example, the investment in the liquor industry in 1914 was only \$962,482,000, or slightly over 4 percent of the total capital value of manufacturing establishments, and wineries, distilleries and breweries employed 72,600 persons, less than 1 percent of the total industrial man power. With the exception of the Latin countries and such small areas as Tunis and Cyprus alcoholic beverages constitute a minute fraction of the import and export trade of modern nations. In France in the decade after the World War, while from 20 to 25 percent of the total exports of foodstuffs and drinks were alcoholic beverages, drink rarely accounted for more than 3 percent of the annual exports of the country.

The production of wine and spirits is highly localized. A line drawn to include Algeria, Morocco, Tunis, Italy, Spain, Portugal and all of France but its twelve northern and north-western departments would enclose more than 80 percent of the world's vineyards. In 1900 total world production was approximately 158,400,000 hectoliters, of which the western Mediterranean area was responsible for approximately 150,000,000 hectoliters. In 1929 total world production was 177,600,000 hectoliters, while the western Mediterranean area produced 151,500,000 hectoliters.

The natural superiorities of soil and climate are usually advanced as the basis for this high degree of localization. On the other hand, areas which are not now devoted to intensive viticulture might become so if climate and soil were the only considerations; California, Argentina, Chile, Cape Colony in Africa, and Australia are all potential wine centers. It is interesting to remember that in the ancient world the eastern Mediterranean area was rich in grapes and wine while today production in that region is slight. It would seem that at least part of the explanation must be sought in those historical factors

which have perpetuated wine and wine making as the traditional beverage and occupation of the inhabitants of the western Mediterranean area.

The manufacture of beer shows a similar concentration. The beer producing nations of the world are the United Kingdom and Germany. Until the World War beer produced by the United Kingdom, Germany, Austria and the United States (where the brewers were chiefly German) made up most of the world production; since the war, however, Austrian production has declined sharply, that of France and Belgium has greatly increased, while American beer manufacturing has been cut to about 30 percent of the pre-war figure because of the outlawing of alcoholic beverages by the Eighteenth Amendment. In 1900 the total world production of beer was approximately 237,354,000 hectoliters, of which the United Kingdom, Germany, Austria and the United States brewed 193,157,000 hectoliters. In 1925 the total world production (excluding the United States) was about 139,819,000 hectoliters, of which the United Kingdom, Germany and Austria were responsible for 87,022,000 hectoliters.

Until the late nineteenth century there was localization within the major producing areas as well. Because the acidic content of water is important in brewing, brewers concentrated in areas where the waters contained a large percentage of acid. It became apparent that beer spoiled easily in warm temperatures, so that plants were located largely in cool climates. Moreover as in the case of wines the taste and color of typical beers became associated with certain localities. Today, however, technical innovations have succeeded in placing both water and temperature under chemical and physical control, so that beer can be manufactured anywhere; other factors contributing to the shift in beer production have been the general availability of the raw materials used in brewing and the ease with which the needed technical information can be obtained. The result has been a fairly wide dispersal of beer manufacture in recent times. In the United States after the 1890's new breweries sprang up throughout the south, breaking down the monopoly of the midwestern brewers.

The distribution of the production of distilled liquor is less concentrated. In 1910 the large producers of distilled liquor were the United States, the United Kingdom, Austria, Germany, France and Russia. After the World War, however, Austria and Russia became small producers,

while the production of distilled liquor declined generally in Europe. In 1900 the total world production of distilled liquor was in the neighborhood of 18,075,000 hectoliters; in 1927 total world production, excluding Russia, the United States and Switzerland, was approximately but 7,734,000 hectoliters.

The figures of per capita consumption of the various alcoholic liquors show interesting variations in national tastes. The Italians drink a great deal of wine but consume very little beer or distilled liquor. Germans, on the other hand, favor beer and distilled liquor and drink relatively little wine; the inhabitants of the United Kingdom display the same preferences and prejudices; so did the American preprohibition population. The French drink wine, beer and distilled liquor with almost equal impartiality. As for Swedes, Norwegians and Danes, they drink large quantities of beer, considerable distilled liquor and but little wine. With the exception of wine the trend in liquor consumption showed a material decline between the years 1900 and 1929. It would seem that the world is becoming slightly less alcoholic.

At one time in England wine was red and sweet and beer was dark, heavy and bitter. Standards of quality were set by tasters, who acquired the dignity of a craft and merited the recognition of an official oath. Today there are numerous varieties in all types of alcoholic beverages as well as many ingenuities of production and variants of taste. Hence standards of quality are very uncertain. It is in many instances difficult to define adulteration. Early beers were made generally of water, barley malt, hops and yeast. The brewing technique was crude, so that a considerable body of solid material remained in the final product; the resulting dark and heavy beer was protected by English law against the competition of brewed beverages made by other processes or with different materials. In time, however, substances like sugar and unmalted cereals, which had formerly been looked upon as adulterants, came to be accepted in the manufacturing process. In the late nineteenth century there began an increase in the use of cane sugar, grape sugar, glucose and maltose for a part of the malt; it was found too that the quantity of hops could be diminished. Melted isinglass put in the ferment deposited a large part of the heavy matter and left the beer bright and transparent. Artificial refrigeration shortened the time required for ripening, thus further reducing the cost. Finally, the addition of carbonic acid gas gave

the beer an effervescence. The resulting new beer was light in color, low in alcoholic content, clear and sparkling. It rapidly became the national beer in the United States and has recently increased greatly in favor in Europe. To the few who cling tenaciously to the traditional beer, however, it is not genuine but adulterated.

Chemical advances applied to distilled liquors have so far failed to overcome traditional prejudice. A Canadian law requires that whisky remain in bond for a given period of years in order to insure the existence of wood matter in the beverage. Any one of the commonly known whiskies may be made by shaking water, alcohol, certain oils and flavorings together. The synthetic whisky thus produced has the same taste, appearance, smell and organic effect but it does not show a trace of wood; therefore it is still regarded as adulterated and not as an achievement of modern technology. The situation is similar in the case of champagne and the various wine spirits, despite the fact that Americans for the greater part of the last two decades have been drinking chemical blends instead of so-called choice liqueurs. Whether in this case the stigma of adulteration will disappear is uncertain, but on particular forms of adulteration there is general agreement. Beers which contain preservatives like salicylic acid, wines which have ether and liquors made with fusel oil are looked upon as deleterious to health.

The liquor industry in the United States as in the rest of the world is one of relatively small establishments, with the wine making plants lowest in the scale. The American Census of Manufactures of 1914 reported that in 318 wineries none employed more than 500 men and only 6 plants employed 50 workers or more. Of the 434 distilleries only 1 plant employed more than 500 men, while one fourth of the total number employed from 100 to 250 workers. Breweries, on the other hand, constituted larger units. In 1914, 3 breweries employed more than 1000 men; 9 had from 500 to 1000 men; while in all more than two thirds of the brewery workers were employed in plants with more than 50 employees. If the establishments are classified according to the value of the product, it is observed that more than two thirds of the wineries had products valued at less than \$20,000 each, while only 3 plants yielded products of more than \$1,000,000. Two fifths of the distilleries were enterprises turning out products valued at more than \$100,000 each. Of the 1250 brewing establishments 95 produced beverages worth \$1,000,-

000 or more, while fully 60 percent of the total manufactured products were valued at \$100,000 or over.

With the exception of the manufacture of sparkling wines, the industry is no longer a handicraft one. The extent to which machinery dominates is indicated by the fact that \$100,000 of capital in 1914 employed only 8 wage earners, a figure far below the average for the manufacturing establishments of the country. The brewing of beer especially is a mechanically controlled chemical process with the yeast, the air, the water, the temperature, the rate of fermentation, the alcoholic content and the amount of albuminoid material all under direct control. This has been achieved by the utilization of air filters, temperature gauges, chemical agents, yeast cultivation and artificial refrigeration. A further step in the mechanization of beer making was effected by the introduction of automatic bottling machines, which clean, cool, fill, cork and pack the bottles in a continuous process.

Since 1899 liquor companies have grown in size, the only exceptions being the wineries. In the United States there was a decrease from 965 distilleries in 1899 to 434 in 1914. During this period the value of the products more than doubled. The number of establishments producing malt liquors was 1507 in 1899 and 1250 in 1914; over the same period the value of the products increased 87 percent. The turn of the century too produced numerous combinations in the distilled and malt liquor industries in both the United States and Europe. Of the various combinations the German groups were quite successful in establishing a centralized, stable control. Development in the United States was less positive. Here the whisky manufacturers were the first to combine, forming various pools in the 1870's and 1880's, a national monopoly in trust form in 1887 and a giant corporation in 1890. The malting companies united to create a national monopoly in the late 1890's and beer producers soon followed their example with various local combinations. This movement toward monopoly was hastened by greatly expanded production as a result of the new processes and the entry of new enterprises, cut-throat competition, the speculative fever on the stock exchanges and the activities of shrewd promoters. The result was that brewing, malting and distilling companies became involved in a network of speculative finance. But if monopoly was ever obtained, it was short lived. Independent distillers and the small malt houses were able

to undercut the prices of the combines and win away their markets. The outcome was less than happy for all but the promoters, some fortunate speculators and those specialists who reorganize corporations. The liquor industry remained one of separately owned enterprises.

The industry was more successful, however, with its trade associations. In the United States there were and in Europe today there are well organized and efficiently conducted trade associations in all branches of the liquor industry. Such groups deal with the general interests of the liquor trade; in the United States the most important activity was the protection of brewers, distillers and vintners against hostile public opinion. In order to try to stem the tide of prohibition sentiment the American associations conducted lobbies in legislative halls, organized clubs, published magazines, subverted the press, gave contributions to political organizations and attempted to boycott the products of those enterprises whose officials were known to have taken a public stand in favor of liquor regulation.

With the recent growth of the industry it was inevitable that the liquor interests should make some efforts to control the sources of retail distribution. There were a number of considerations which prompted the creation of a close union between brewers and wholesalers on the one side and the retail stores (saloons and public houses) on the other. In the first place, the size of the financial stake which the brewers in particular had in their industry called for the maintenance of a permanent retail outlet for their wares. Second, the drinking habits of the American and British populations, which had grown accustomed to drinking their beer and hard liquor in public places, demanded the establishment of a great number of conveniently located saloons. Third, the saloon keepers were usually men of small means and incapable of financing themselves. Fourth, the mounting license fees compelled saloon keepers to seek the patronage and assistance of the brewers and wholesalers. The result was the building up of a system under which the retail distributors were nominally the owners of their saloons but in which actually they acted as the agents of the larger units in the industry. In Great Britain this relationship came to be called the "tied house" system; under it, as a rule, the brewer or wholesaler advanced the saloon keeper's license fees and in exchange took a chattel mortgage on the saloon furniture and fixtures. In effect this procedure acted as a complete check on the saloon keeper, for his refusal

to handle his patron's wares or his inability to manage his house brought about the termination of the financial support accorded him.

To a very real extent both brewers and saloon keepers found the system advantageous. The brewer possessed what amounted to a proprietorship control without the attendant responsibility, and the saloon keeper was enabled to borrow a considerable part of his working capital. It has been impossible to determine, however, whether the system was ultimately of real benefit to the brewers, for on the debit side there always stood the fact that many of them had millions of dollars invested in doubtful securities. It is true that some brewers seriously questioned the whole structure of the brewery-saloon relationship and advocated its abandonment and the substitution for the prevailing method of the sale of bottled beer through grocery stores and specialty shops; but it was generally appreciated that there were insuperable obstacles in the way of such radical reorganization. Such a change would have meant not only the development of a new system of distribution but also a recasting of the drinking habits of most consumers of alcoholic beverages.

In the United States the ratification of the Eighteenth Amendment and the passage of the National Prohibition Act precipitated a crisis for which the liquor industry was little prepared. Too many of its members had lulled themselves into a false sense of security with the belief that nation wide prohibition could never become an actuality. When the blow fell in 1920, however, liquor manufacturers and dealers were compelled to choose from among a group of equally undesirable courses. They could shut down their plants in the hope of repeal or modification. They could continue to operate as illicit breweries or distilleries. They could convert their plants to other uses. They could sell their establishments to other industrial enterprises. Or, finally, they could merely salvage their machinery and other equipment. Whichever course was chosen, the entrepreneur was certain to lose heavily.

No records are available to indicate statistically how the liquor industry adjusted itself to this trying problem. The distilleries had the greatest difficulties to face, for only 25 out of the 880 such plants recorded in the 1914 tabulation of the United States Bureau of Internal Revenue had been distilling alcohol from molasses and therefore conversion into factories for the manufacture of industrial alcohol was possible only in a very few cases. Most of the distilleries in fact

either shut down or dismantled their plants completely. The breweries were a little more advantageously situated, as is evidenced by the fact that, by 1921, 667 former breweries were producing some form of non-alcoholic beverage. A number converted their plants into establishments for the manufacture of candy, cheese, syrups, cider, ice cream, vegetable oils, egg powder and condensed milk. But while there occurred instances of profitable adaptation to the requirements of prohibition, the liquor industry suffered a great financial loss, for by and large there was not a sufficient increase of consumption to absorb the additional output of the converted breweries. Nor did the American public take quickly to the so-called cereal beverages or near beer which breweries were permitted to produce.

Despite the banning by the National Prohibition Act of all alcoholic beverages except medicinal liquors and sacramental wines the American public was not to go without its alcoholic drink. The technique of bootlegging was not unfamiliar to Americans, for long before prohibition high prices in the dry territories and high licenses in the wet had made the illicit traffic commercially advantageous. This had usually taken the forms of the diversion of industrial alcohol, fictitious labeling, the refilling of original bottles, the dilution of whisky with water and alcohol and the production of synthetic drink out of flavorings, alcohol, coloring and water. It is true that during the first two years of prohibition the American liquor industry struggled against great odds and that moonshining, smuggling and seizure by stealth and violence succeeded in providing only a small commercial supply. The total amount of alcoholic beverages produced in 1921, the first year of the prohibition experiment, as estimated by Clark Warburton, was 33,000,000 gallons of spirits, 54,000,000 gallons of wine and 136,000,000 gallons of beer. The industry had begun to adjust itself by 1923, when the total estimated production reached 219,000,000 gallons of spirits, 86,000,000 gallons of wine and 250,000,000 gallons of beer. Since that year its growth was steady until it reached 124,000,000 gallons of wine in 1929 and 225,000,000 gallons of spirits and 864,000,000 gallons of beer in 1929. A comparison with production for the fiscal year 1916-17 plainly shows that except in the case of beer the amount of liquor manufactured for the American drinking public exceeded the preprohibition supply. The 1917 output was 42,723,000 gallons

of wine, 167,740,000 gallons of spirits and 1,885,071,000 gallons of beer.

Ten years after the inauguration of the prohibition era the illicit liquor industry was probably as well organized as any in the American industrial scheme. The violence and the numerous killings attending it merely grew out of the necessary absence of a recognized institutional procedure for the adjudication of disputes; but violence as such did not impede the steady flow of beer and hard liquor from producer to consumer. The size of the establishments was small but plants were numerous, as is indicated from the fact that confiscations by federal officers in a year usually amounted to more than the total of breweries and distilleries in existence before prohibition. Illicit manufacturers were able to operate with impunity great fleets of trucks, sending them over the main highways for long distances. Indeed many of the breweries were large enough to make use of the most improved technical processes, and it was claimed for some that they had reduced the cost of brewing by a sizable margin. Although originally the illicit liquor traffic had been financed with reinvested profits and the revenues of various collateral unlawful enterprises, like prostitution, commercial extortion and gambling, later capital funds attracted by the evident success and stability of the industry were derived from legitimate financial channels. It appeared that the financing of a well established operator, particularly in the beer trade, presented no real difficulties. Nor did the outlawed saloon long stand in need of a substitute. In the place of the corner saloon there sprang up a group of institutions as numerous and as conveniently located as the old retail outlets—the speakeasies, road houses, night clubs, blind pigs and beer flats of the prohibition era—which like the old saloon were assured of economic stability because in many instances they had the physical protection and financial support of the brewers and wholesalers.

It is true that there existed considerable variance in the organization of the many phases of the industry. In Chicago, for example, the production, distribution and retail sale of beer and auxiliary commodities have been under a single control, making for a rather large and complicated undertaking and therefore requiring exceptional recourse to violence. In New York City, on the other hand, the brewing of beer, its wholesale distribution and its retail sale are separately handled. There is of course an understanding between the brewers over the division

of the market, and similar agreements probably exist among the wholesalers. In the import trade on the eastern coast there is a high degree of organization. Large ships owned, it is claimed, by international syndicates bring liquor to the twelve-mile line; here it is assigned to a smuggling group operating independently and is taken by them into ports of call; finally another group takes over the supply and sells it to wholesalers for retail distribution. A fair amount of cooperation apparently exists among the various parties.

The quality of prohibition liquor probably compares not unfavorably with much of the pre-prohibition supply. The larger breweries employ modern mechanical and chemical devices, although it is not unlikely that they may hasten the period of maturing in order to increase turnover; the final product may therefore turn out to be a somewhat "rank" beer. Distilled liquors are almost wholly synthetic blends, but there is sometimes sold in the cheaper speak-easies a deleterious whisky made either of incompletely denatured alcohol, unconverted wood alcohol or alcohol in which the distillation has been inexpertly performed.

There are various types of business organization to be found in the illegal liquor traffic. Most wine and considerable beer are made at home. As for the commercial undertakings, there are companies which hold government permits to operate denaturing plants, perfume factories, patent medicine laboratories or cereal beverage works but, using their permits as a screen, actually manufacture potable alcohol. Again, there are entirely legal organizations producing non-fermented, concentrated grape juice or wort which with relatively little trouble on the part of the domestic user can be converted into wine or beer. In a third group may be placed the restaurants and clubs which sell food as an adjunct to their retail liquor business. Finally, one finds a great number of frankly illegal breweries, distilleries and saloons which operate by virtue of friendly and pecuniary intercourse with the law enforcement authorities.

The essential elements of this wide flung illegal activity are the gang and its leader. Certain numbers in each such group, possessing business and administrative capacities, constitute the executive personnel and are in charge of technical operations. Others combine the functions of the police and the military and furnish protection for the leader and the liquor ring's trucks and act as trade agents, in this capacity establishing new contacts, extending the market and

eliminating competition. The usual methods are violence and intimidation; these are often flagrantly employed, and legal apprehension and punishment of the culprits are rare.

The gang leader in place of the socially recognized ownership of ordinary business operations maintains a kind of suzerainty over his properties and personnel. Transfer of suzerain rights and their sharing and extension are brought about not by the usual commercial practices of purchase and sale but by force of arms. Nevertheless, alliances and agreements are often established by consent and are sometimes put into writing; the breaking of contracts is seriously regarded and the penalty in such cases is usually death. The functions of the gang leader are those of the higher management of big business. He formulates general policies, negotiates with gang chieftains in other localities and handles public relations matters. This last is probably his most important activity, for the security of his authority and his pecuniary success depend upon his ability to conduct his enterprise without too much molestation and to obtain the needed "protection" from political leaders and the police. Protection is attained by a variety of methods: outright payments of money are made; personal favors to politicians, such as loans of money and privileged participation in trade profits, are awarded; and control over powerful political organizations, such as district clubs and local trade unions, is sought and obtained. A successful gang leader draws upon a variety of aptitudes—indeed they are not very dissimilar from those which go to make up the socially recognized captain of industry: pecuniary shrewdness, executive force, insensitivity to the conventional tabus regarding violence and a capacity for diplomatic manoeuvring.

LIQUOR TRAFFIC. Evidences of the international liquor traffic are to be found in the early histories of Egypt and Babylonia. In Greece wine soon became an important article of commerce and as early as 800 B.C. its export formed a part of the foreign trade of a number of the Greek cities. The Greek wine merchants sent their wares to such distant points as the Euxine, Scythia, Lydia, Iberia, central Asia and even to what are now the Kiev region, Silesia and Brandenburg. Under the Roman Empire the wine trade flourished: Italian wines were exported to almost all parts of the empire and the native wines of Egypt, the Euxine, Greece, north Africa, Spain and southern France were imported. Even with the decline of trade under the late empire the wine traffic did not cease entirely, for from the fifth to the eighth century Italian wines reached Russia by way of the Dnieper and the Volga rivers; also during the eighth and ninth centuries the wine and beer of Mediterranean cities were exported into northern and western Europe.

With the reversion to a local economy in the Middle Ages the liquor traffic for a time almost entirely disappeared. But by the thirteenth and fourteenth centuries shops for the sale of wine and beer were already in existence in the larger European cities, and the trade in these commodities had become so important that in Germany and England it was subjected to restrictive legislation. The growth of national states in the

fifteenth and sixteenth centuries was accompanied by a great expansion of the traffic. Wines from Spain and France, gin from Holland, beer from the German cities and ale, beer and whisky from England were important articles of commerce; naturally strong efforts were made either to identify the liquor traffic with national interest or to utilize it to strengthen other economic groups. By the Methuen Treaty between England and Portugal in 1703, for example, which was motivated by the representation of English cloth merchants that Portugal was likely to be a better market for their wares than France, Portuguese wines were admitted into English ports at a duty of £7 a tun, while French wines were compelled to pay £55 a tun; as a result the English, who had been large consumers of claret, now became drinkers of port.

The nineteenth century saw a relaxation of mercantilistic restrictions over the liquor traffic. As a result of Gladstone's great reduction of duties on wine in 1860 English consumption of continental varieties increased. About the middle of the century beer and *Branntwein* were among the leading export commodities of Germany. New markets for trade spirits were developed in the backward regions of the earth but with such devastating effect on the natives that international agreements were necessary to curtail such traffic, particularly in Africa. Toward the end of the century the consumption of alcoholic beverages greatly increased and it was not until the period following the World War that there set in a general decline, especially in the drinking of spirits.

In recent times, as the market for liquor has contracted, drink manufacturers have found themselves hard pressed to develop new outlets for their wares and liquor interests have therefore again sought the aid and protection of their governments. One of their most successful devices has been the invocation of the spirit of nationalism. The British are exhorted to drink empire rather than continental wines; in France Alsatian beer is favored at the expense of German; the Germans in turn are asked to drink their own *Sekt* instead of French champagnes; Argentineans are learning to prefer the products of their own vineyards to the once popular European wines. Nevertheless, liquor still plays an important role in the foreign trade of many European countries, particularly France, Spain and Portugal. France, the greatest wine producing country in the world, imports more wine than it exports; part of the imported wine is for

French consumption and part is blended with the finer French burgundies, clarets and the rest for export to northern European countries and Great Britain. Spanish exports of wine are large and the liquor interests have been very influential in shaping the government's foreign commercial policy. In Portugal wine making is the chief industry and accounts usually for a major share of the country's annual exports.

As a result of pressure brought to bear by the French, Spanish and Portuguese governments Iceland and Norway have been compelled to modify drastically their liquor laws. In 1921 Spain threatened a virtual embargo on Iceland's salted codfish unless the Icelandic prohibition against foreign wines was removed; the next year Iceland bowed before the demand and consented to admit Spanish wines with an alcoholic content up to 21 percent. Norway met with almost insuperable obstacles in her efforts to put into effect a national prohibition law, beginning with 1921, because of the existence of commercial treaties with France, Spain and Portugal under which Norwegian fish was to receive preferential treatment in return for similar rights accorded French, Spanish and Portuguese wines. In 1921 Norway gave way before French pressure and signed a new convention admitting French wines of less than 14 percent alcoholic content, under preferential rates, and a yearly shipment of 400,000 liters of wines and spirits of more than 14 percent alcoholic content to be used for medical, scientific and technical purposes. After prolonged negotiations similar concessions were made to Spain and Portugal, the former being allowed to ship annually 150,000 liters of heavy wine (more than 14 percent alcoholic content) and the latter 850,000 liters. In 1923 the section of the Norwegian prohibition law relating to the importation of heavy wine was repealed altogether.

Liquor smuggling on a large scale has been another problem that has arisen in recent times to vex governments seeking to maintain a rigorous policy of liquor control. The United States and the Scandinavian and Baltic countries have been notable sufferers in this respect. The extensive frontiers of the United States make it difficult to check smuggling; and while the precise amount of liquor goods illegally imported cannot of course be ascertained, the traffic must be large. It is true that the United States has gained the cooperation of a number of liquor exporting and mercantile nations, which have agreed to recognize American jurisdiction over

the liquor traffic on its bordering seas to a twelve-mile limit instead of the traditional three; also the increased and improved personnel of the American Coast Guard Service has made the landing of liquor less easy than formerly. But the National Commission on Law Observance and Enforcement (Wickersham Commission) has justly pointed out that the United States is particularly vulnerable because of her contiguity to Canada, despite Canada's law of 1930 which prohibits the declaration of withdrawals of liquor for direct exportation to her southern neighbor. Smugglers have merely shifted their bases of operations from Canadian lake and river ports to the islands of St. Pierre and Miquelon, the Bahamas, the West Indies, Mexico and Central America, all of which serve as depots for the running of Canadian whiskies into the United States. The commission's report says (*Report on the Enforcement of the Prohibition Laws of the U. S.*, p. 24-25): "In three years ending in 1929, while the reexports of whisky, all of which but a negligible few gallons had gone to the United States, had multiplied by between four and five, the amounts of Canadian whisky declared for export to the United States had remained stationary. One must, however, note the amounts declared for export to places where there was no substantial market except for smuggling into the United States. In five years ending in 1929 the declared exports of whisky from Canada to the British West Indies more than doubled, from Canada to St. Pierre and Miquelon multiplied almost by four, and to British Honduras multiplied by more than three. . . . It would be a mistake to assume that the cutting off of clearances of liquor from Canada to the United States has achieved its helpful intention. Continual increase in Canadian production, with no corresponding increase of Canadian home consumption, indicates the contrary."

In the Scandinavian and Baltic countries the smuggling of liquor presents perhaps even greater difficulties. Sweden can be reached easily by rum runners from Germany; and Denmark until 1928, when the privilege of free importation of spirits and wine was denied to all but a group of licensed firms, was at the mercy of the illicit traffic because of the fact that Copenhagen had long been a free port. A memorandum on smuggling submitted to the Finnish government in January, 1923, by the Finnish Prohibition League concentrated attention on the existing evil in the whole north European area with the result that Norway took the initiative in inviting

the cooperation of Sweden, Finland, Denmark and Germany for the creation of a common program. A conference at Oslo, held in June, 1923, was followed by a conference at Helsingfors two years later. This led to the signing of a multilateral convention in August, 1925, by Finland, Norway, Sweden, Denmark, Germany, Poland, Lithuania, Estonia, Latvia, Russia and the Free City of Danzig which sought to surround the international liquor traffic with serious restrictions. All spirits of more than 18 percent alcoholic content (in the case of Germany and of Russia the maximum was put at 22 percent) could not be exported to the signatory powers in vessels of less than one hundred tons; exports in vessels of more than one hundred tons and less than five hundred tons were to be permitted only when authorized by officials of the country of origin; every ship's master was to be required to keep a record of all shipments and present written declarations vouching for the legality of his wares; a twelve-mile limit was agreed upon for purposes of search and seizure. But smugglers found little difficulty in evading these limitations on their activities by the simple device of registering their vessels under the flags of nations not party to the Helsingfors convention.

In September, 1926, Finland, Sweden and Poland united in a request to the League of Nations for an investigation of the liquor traffic, particularly smuggling. Denmark, Belgium and Czechoslovakia soon joined the petitioning nations; the result was the reference of the subject to the Committee on Technical Organization in September, 1927, and the adoption of a plan a year later for a study of the illicit liquor traffic and the abuses growing out of alcohol consumption. Wine and beer were not to be included in the inquiry. By 1932 no definite recommendations for an international program had yet been made.

While matters arising out of the international liquor traffic have thus claimed the attention of many modern states in recent years, the problem of governmental sumptuary control over the local liquor traffic has been even more vexing and insistent; in fact in the period following the World War it has assumed the place of a major public question in almost every civilized nation in the world. Governments have instituted many devices to make possible sumptuary control, short of outright prohibition; and they have met with varied success. The most frequently occurring forms of control have been: high taxation, especially discriminatory in the case of strong

drink; high license and the limitation of the number of retail outlets (saloons or public houses); the establishment of quasi-public or limited dividend corporations for either the manufacture or the retail sale of spirituous drink or both; the creation of direct governmental agencies or government monopolies for the manufacture, importation, distribution and sale of liquor.

The employment of excise duties on liquor for the purpose of raising revenues has long been familiar in public finance policy; a tax on drink figured prominently in Alexander Hamilton's first fiscal program for the United States. Up to 1860 the American government imposed excise taxes on various forms of intoxicating liquors. During the Civil War rates were increased, and for the last two years of the struggle the average annual return accounted for 16.6 percent of the Union government's internal revenue receipts; from 1866 to 1915 the practice was continued, so that the average annual proportion of total internal revenues derived from the malt and liquor taxes ranged from 50 to 78 percent. War and post-war governments particularly have resorted to the liquor excise for revenue raising purposes. In France before the World War the excise on wine was 1.5 francs per hectoliter; by 1919 the rate had been increased to 19 francs and after being lowered somewhat during the following two years was increased in 1922 to 25 francs. By 1920 the French excise on spirits stood at 1000 francs per hectoliter. The excise on beer is 2 francs per hectoliter for each degree of alcohol. In the United Kingdom in 1913-14 the excise duty on spirits was 14/6 per proof gallon and on beer 7/9 per standard barrel; during and after the war the rates were raised so that since 1920 the spirits tax has been 72/6 per proof gallon and the beer tax 100/- per standard barrel. In 1930 the beer tax was fixed at 103/- with a rebate of 20/- under certain conditions. At the beginning of the twentieth century the United Kingdom was deriving 41.8 percent of total ordinary revenues from the liquor excise; in 1930 the proportion from the same source was 19.1 percent. It is important to note that the great increase in the English liquor excises during the post-war period was as much a conscious effort at sumptuary control as a revenue raising device, although English lawmakers also favored the principle of high license with accompanying limitation on the number of public houses.

In Denmark the government relied chiefly on the excise to bring the liquor traffic under public

control. In March, 1917, hard pressed by a decline in its foreign trade and forced to tap new revenue sources, it placed a so-called extraordinary tax on all existing stocks of spirits, the rate being made equal to the retail price at the time. During the war period the excise was raised until it stood at 20 kroner (\$5.36) per liter of spirits and 18 kroner (\$4.82) per 100 liters of beer. In 1922, determined to exercise a permanent hold on the industry in the interests of reduced consumption of strong drink, Denmark fixed the excise on spirits at 15 kroner per liter (changed in 1930 to 17 kroner) and levied direct taxes on the sales of liquor manufacturers, importers and retailers as well as on the liquor sold in restaurants, hotels and public houses. To further the governmental purpose of sumptuary control in 1923 Denmark licensed a single company to manufacture all the spirits for the country; the terms of the agreement called for a limitation of profits to 9 percent on the capital stock. The result has been a marked decline in consumption of spirits, the per capita consumption dropping from 2.18 proof gallons (United States standard) in 1913 to 0.32 proof gallons in 1929.

The licensing of the retail dispensers of liquor, i.e. the saloon keepers, was resorted to particularly in the United States and the United Kingdom. In the former the method met with only indifferent success; in the latter it has proved efficacious. Before the inauguration of national prohibition every state in the American union with the exception of Kansas and North Dakota experimented at one time or another with the licensing system. High license with only a slight attempt to supervise the saloons themselves was employed in great commonwealths like Pennsylvania, New York and Massachusetts; the usual restrictive measures called for a limitation of the number of local saloons on the basis of population, the posting of a heavy bond by proprietors, Sunday and election day closing and the prohibition of alcohol sales to minors and intoxicated persons. Low license was employed in other states and was accompanied as a rule by a more elaborate code for the regulation of the dispensing agencies. The character of the licensing authorities varied widely: in Massachusetts, except for Boston, the license commissioners were named by the mayor and aldermen of the cities and the selectmen of the towns; in Boston licensing matters were handled by the board of police commissioners appointed by the governor; in New York after the enactment of

the Raines Law of 1896 the licensing agency was a state excise commission; in Pennsylvania licenses were granted by the judges of the courts of Quarter Sessions. Despite this general preoccupation with the problem it is to be noted that the many licensing systems, whether they placed their chief reliance on high license or on elaborate regulatory codes, did not succeed in checking the growth of the saloon. Distillers and brewers found it to their interest either to subsidize saloon helpers or to advance in the form of loans the necessary sums for the payment of heavy license fees; where elected officials were in charge of the issuance of licenses, it was inevitable that the liquor industry should seek to control the local political machine or by heavy campaign contributions make it more amenable to reason.

In Great Britain, on the other hand, the licensing system, accompanied by a definite policy looking toward the reduction of the number of public houses and the restriction of hours of sale, has proved markedly successful. Thus the per capita consumption of spirits has dropped from 0.96 proof gallons (United States standard) in 1913 to 0.38 proof gallons in 1929, while the per capita consumption of beer has dropped from 33.3 gallons (United States standard) in 1913 to 19.7 gallons in 1929. The English have experimented with this mode of control for centuries; and out of a long series of codes, beginning with the licensing acts of the Tudors, there was finally evolved the act of 1904 and the Licensing Consolidation Act of 1910. The basic principle of English liquor legislation was thus put by the Earl of Balfour in 1904: "You will never get rid of the public house from this country. . . . What then should you aim at? Surely at this ideal, that the public house should be kept respectably, should be kept by respectable persons, and should be kept in such a manner as will make those who frequent it obey the law and conform to the dictates of morality" (quoted by Catlin, G. E. G., *Liquor Control*, p. 150-51).

The English scheme therefore provides for the granting of licenses by local justices of the peace, who are appointed for life by the lord chancellor; a strict supervision over the physical conditions of the licensed premises and a close examination into the financial and moral responsibility of the publicans; extinguishment of licenses in those areas where public houses seem in excess of the needs of the community; and state experiments, through the erection and operation of model public houses and even the

direct ownership of breweries, in an effort to determine how those characteristics of public drinking which are deemed socially desirable can best be conserved. The official regulations concerning conditions of sale and hours of opening of the public houses are explicit. Thus children under fourteen years may not be served at the bars; the sale of liquor to persons under eighteen years for on-premise consumption is prohibited; no sales on credit, except for off-premise consumption, are allowed; gambling in public houses is illegal. In London the hours of sale are limited to nine, between 11 a.m. and 11 p.m., with a break of at least two hours in the early afternoon, while on Sundays and certain designated holidays they are restricted to five. Outside London the hours of sale are limited to eight, between 11 a.m. and 10 p.m., with a break of two hours in the early afternoon; Sunday and holiday hours are similar to those in London.

Licenses are usually granted for a year, but the period may be extended to a maximum of seven years; after that time applications for renewal are treated as new licenses. A license originating before 1904 may not be revoked (except for cause) unless the owner is compensated out of a fund built up from a direct levy on all licensed places. That the program of eliminating unnecessary public houses has been pushed vigorously may be seen from the fact that in England and Wales alone, from 1905 to 1929, \$96,000,000 has been paid out of the compensation fund; also the ratio of public houses to population has dropped from 33.94 on-licenses per 10,000 of population in 1895 to 19.77 on-licenses per 10,000 of population in 1929. While the decrease in the number of licensed houses has been accompanied by an increase (from 6589 in 1905 to 13,526 in 1931) in that of registered clubs, many of which are organized solely for the purpose of supplying liquor to their members at all times, there has been a decided falling off in the total number of on-license places.

Australia and New Zealand have handled the liquor traffic in much the same way, that is to say, through high license and a reduction of on-license places; in the states of South Australia and Western Australia the extinguishment of liquor permits may be effected by local option. In 1923 France limited the number of places selling intoxicating beverages to that then in existence; no attempt has been made, however, to reduce the number of establishments already possessing licenses.

In Sweden the liquor traffic has been brought

under control through the creation of limited dividend corporations for the manufacture and sale of drink, the virtual rationing of the population and the prohibition of on-premise consumption except in eating places. Since 1865, when the so-called Gothenburg system was introduced, the Swedes have been experimenting with the possibility of checking the spread of the drink evil by eliminating the economic incentive in the liquor traffic. But the Gothenburg plan, operating through limited dividend corporations having local monopolies for the retail sale of brandy, was only partially successful because it did not cope with the manufacture and importation of spirituous drink and the sale of beer, wine and wine spirits.

Largely as a result of the activities of Dr. Ivan Bratt, who began in 1913 to build up a monopoly, in the public interest, of the distillation and wholesale distribution of strong drink, Sweden in 1919 radically modified the Gothenburg system and moved to eliminate private profit from every branch of the liquor industry. The Wine and Spirits Central, a limited dividend corporation financed by private capital but with its profits restricted to 7 percent annually, was invested with a national monopoly over the manufacture, importation and wholesale distribution of all spirits; some 122 independent private corporations, also of a limited dividend character and with their annual return restricted to 5 percent, were created to handle retail distribution; the state was to receive the surplus profits of the Central and the local distributing agencies.

There are two additional elements in the Swedish system of control. Spirits are sold by the bottle for off-premise consumption only; in licensed restaurants and hotels the quantity which may be sold each customer with his meal is limited. Also liquor sales to individuals for off-premise consumption are closely regulated: only possessors of pass books may purchase at the system stores. The applicant for a pass book is required to state his age, occupation and income and the size of his family and to provide convincing proof of his sobriety; if he is married and over twenty-five years of age he may purchase four liters every month. Bachelors, women and persons of small income are allowed from as much as three liters a month to as little as four liters during the course of the year. Wine and beer are sold freely, but the alcoholic content of the latter is limited to 3.2 percent by weight. Pass books are liable to cancellation if the holder is reported by the police to be a

habitual drunkard, if he has resold purchased liquor or if he has made excessively large wine purchases. As a result of this close surveillance of the nation's drinking habits the per capita consumption of spirits has declined from 1.82 proof gallons (United States standard) in 1913 to 1.24 proof gallons in 1929. Norway, after experimenting with the Gothenburg system for more than forty years and with a modified form of prohibition from 1921 to 1927, has sought to control the liquor traffic by means not unlike those adopted by Sweden; that is to say, through a national limited dividend company which has the monopoly over the manufacture, importation and wholesale distribution of spirits and a system of retail outlets, whose profits also are definitely fixed.

In Canada governmental control over the liquor traffic assumes still another form, that of monopoly over retail sales. After passing through the cycle of local option, provincial prohibition and dominion prohibition (the latter two methods were tried during the war period) the Canadian provinces have sought to cope with the problem by taking into their own hands the retail distribution of spirits. Quebec was the first to adopt the new system, in 1921; British Columbia joined in the same year, Manitoba in 1923, Alberta in 1924, Saskatchewan in 1925, Ontario and New Brunswick in 1927 and Nova Scotia in 1929; prohibition continues to exist only in Prince Edward Island and the Northwest Territories. While the form of control differs from province to province, the following characteristics are common to all of them: the manufacture of whisky, beer and wine is privately owned, but distillers, brewers and vintners are strictly supervised by provincial commissions; the retail distribution of spirits is a provincial monopoly, with provincial control boards in every case empowered to buy, sell and manage property, grant and revoke permits, hire and discharge employees and create policies; the on-premise consumption of spirits is nowhere permitted, all sales being by sealed package only. Within this frame there are of course wide variations, particularly as regards the sale of beer and wine. Beer may be bought by the bottle at government stores in all the provinces; from beer stores operated by brewers in all the provinces except Saskatchewan, New Brunswick and British Columbia; and by the glass in licensed taverns or beer parlors in Alberta, British Columbia, Manitoba and Quebec. Except in the cases of Ontario and Quebec wine can be acquired only

in the government stores and for off-premise consumption. Except in Manitoba and Saskatchewan there is no limit to the quantity of wine which may be sold a customer. Five of the provinces—Alberta, British Columbia, Manitoba, Ontario and Nova Scotia—approximate the Swedish system by requiring individual permits for the purchase of spirits; like Sweden all the provinces empower their liquor control boards to deny the purchase of liquor to habitual drunkards. The per capita consumption of spirits in Canada has decreased from 1.36 proof gallons (United States standard) in 1913 to 0.55 proof gallons in 1929.

Government monopoly for purposes of liquor control has not been unfamiliar to American history. The so-called dispensary system on local lines, under which municipal authorities had the exclusive right to dispense spirits, first made its appearance in Athens, Georgia, in 1890; and during the next twenty-five years similar agencies were functioning in a number of towns and counties in Georgia, Alabama, North Carolina, South Carolina and Virginia. In 1893 South Carolina undertook the establishment of a state wide dispensary scheme by which the state itself had a complete monopoly of the sale of alcoholic drinks. The system was operated by a board of control made up of the governor and two other persons, who purchased the liquor for the state and appointed local boards for the separate counties. The private manufacture of liquor in South Carolina was outlawed; the liquor to be dispensed was acquired in bulk, bottled and packaged and distributed among the county and city agencies for retail sale and off-premise consumption; the retail agencies on their part were strictly supervised as to hours of closing, the registration of purchasers and denial of sale to intemperate persons. Half the profits from the retail sale of spirits was to go to the county and half to the municipality. The profits from the state handling of the liquor were to be turned over to the South Carolina treasury to be used for educational purposes. In the fourteen years during which the state dispensary system was in existence the average annual return to the state was \$465,000. In 1907 decentralized county agencies were substituted for the state dispensary; in 1915 the county dispensaries were abolished and state wide prohibition was inaugurated.

A number of factors brought about the abandonment of the dispensary system in South Carolina. In the first place, it was used as a

football of politics: its offices were regularly employed to strengthen the personal machine of the governor. Secondly, the purchase of liquor at wholesale from private distillers made corruption inevitable: gratuities and rebates were accepted by dispensary officials. Finally, the high price of government liquor and the restricted hours of sale led to the appearance of a flourishing illicit liquor traffic made up of the usual bootlegging and moonshining and the operation of blind tigers and clubs.

State monopolies exist in Switzerland, Germany, Poland and Russia, although only in the case of the first named is the control of the liquor traffic the chief reason for the establishment of the monopoly. The Swiss began experimenting with a federal monopoly in 1874 and in the following period the manufacture of alcohol and liquors from potatoes, molasses, sugar and grain became an exclusive state concern; but the great growth in home distillation compelled a complete overhauling of the system in 1932. Under the new dispensation private distillers are first to be licensed and then gradually bought out; home distillation is to be taxed; the monopoly's control is extended over the manufacture, transit and sale of liquors distilled from fruit spirits; and wholesale handling is to be largely the concern of the state monopoly with legally fixed minimum and maximum prices, which may be paid the distillers. The cantons are given wide powers in handling retail sales; they may prohibit the sale of liquor for on-premise consumption; they may restrict hours of sale; they may tax hotels, restaurants and shops handling spirits. Interstate retail liquor sales, however, are placed under federal control.

Germany in 1922 created a federal monopoly over the importation, manufacture, exportation and sale of spirits. Private importation is permitted but is subject to very high taxation; all domestic manufacturing is on the basis of permits, which are used as tax devices. In 1924 Poland established a state alcohol monopoly vested with the right to buy and sell alcoholic beverages and to manufacture pure spirits. But production, as in Germany, remains a private enterprise, the distillers being taxed through licenses. Russia as early as 1894 sought to restrict the heavy drinking of vodka and at the same time to use the liquor traffic for fiscal purposes, when the retail handling of the beverage was made a government monopoly and government shops were set up for off-premise sales only. Private establishments might operate, but

they were in effect government commission houses and their numbers were limited. Distillation was in the hands of private manufacturers; rectification was performed at government plants. In 1913 one fourth of the annual state revenue came from the liquor traffic. During the World War the sale of vodka was entirely prohibited, and for a time the Soviet government made an effort to continue prohibition. But wholesale bootlegging and the appearance of a substitute vodka called samogon forced the gradual abandonment of prohibition and the establishment of a complete state monopoly in 1925. Since that time there has been an increase in the amount of vodka manufactured (although present production is well under pre-war figures) and an appreciable decline in the consumption of samogon. The significance of the part played in Soviet financing by the receipts of the vodka monopoly may be seen from the fact that revenues from this source grew from 587,000,000 rubles in 1926-27 to 1,542,000,000 rubles (13.3 percent of the total budget) in 1929-30.

LIST, FRIEDRICH (1789-1846), German economist. The son of a prosperous tanner of the free town of Reutlingen, List early absorbed the doctrines of the Enlightenment and of classical economics, finding in them an excellent weapon for combating the rule of an arbitrary bureaucracy and the restrictions of the lingering guild age. Under Wangenheim's ministry he found it possible to give full scope to his liberal political ideas as adviser to the Württemberg government, as professor in the faculty of economics founded at his suggestion at the University of Tübingen and as editor of several publications. With the rising tide of the German reaction, however, his activity soon came under suspicion. What above all caused most German governments to look upon him as a demagogue was his establishment in 1819 of an association of merchants and industrialists, the so-called *Handels- und Gewerbsverein*, as well as his advocacy of the abolition of internal customs barriers. When in 1820 he was elected to the legislature and on behalf of his native town petitioned the authorities for an extension of local self-government and for publicity in judicial procedure, he was sentenced to ten months' imprisonment for attempting to undermine the stability of public institutions. List fled abroad and led a wandering life for several years. In 1824 he returned to his native country, where he was promptly arrested; released upon a promise to emigrate to America, he sailed in 1825 for New York.

In the United States List engaged in various activities; he was a farmer, an editor of a German newspaper at Reading, Pennsylvania, a successful mine and railroad promoter and a keen student of the economic and political problems which beset the growing country. His experiences served to confirm the doubts which he had begun to entertain in Europe concerning the tenableness of Adam Smith's doctrines, and he concluded now that a protective tariff was indispensable to industrially undeveloped countries. At the suggestion of Charles Ingersoll, vice president of the Pennsylvania Society for the Promotion of Manufactures and the Mechanic Arts—the rallying point of the protectionist elements of the time—List prepared the *Outlines of Amer-*

ican Political Economy (Philadelphia 1827), his first attempt at a systematic formulation of his views.

Appointed United States consul in 1832, List returned to Germany and embarked upon an ambitious plan to organize a German railway system, a venture which although successful in itself proved a source of personal disappointment and even forced him to leave Germany for France. A prize offered by the French Academy in 1838 gave him an opportunity to rework his theoretical system and to give it a historical basis. The studies and experiences of these years he embodied in his best known work, *Das nationale System der politischen Oekonomie* (Stuttgart 1841; tr. by S. S. Lloyd, London 1885), appearing after he had settled permanently in Germany. Beginning with 1843 he published *Das Zollvereinsblatt*, devoted to the dissemination of his views, which were now supported by rising industrialism and respected by men like Metternich, Peel and Palmerston and began to exercise a decisive influence in molding public opinion in Germany. Material worries, however, combined with the opposition to his plan to establish an alliance between Germany and Great Britain hastened his self-inflicted death.

With the exception of Karl Marx no other economist has emphasized so strongly as List the close interrelation of the theoretical economic viewpoint and political factors. Economic doctrines had no abstract validity for him; he always examined accepted views and developed his own ideas in terms of concrete political areas at definite levels of economic development. He severely criticized the classical writers for failing to recognize the significance of the nation as the most important link between the individual and mankind. He saw the logical expression of the industrial and commercial supremacy of England in the economic principles of the classical school and deemed them unsuited to the needs of rising countries like Germany and the United States. The object of his writings accordingly was to present a theoretical system which should express the interests of countries occupying second or third rank but possessing the potentialities of first class nations.

Departing from the individualistic-cosmopolitan classical economics, which in its centering of economics around the theory of value revealed to List its atomistic-materialistic orientation, he made the concept of productive forces the core of his organic doctrine. Accordingly he opposed to the classical emphasis on division of labor his

emphasis on the cooperative aspects of the productive process in society. His dynamic approach and his interest in the development of the productive forces led him to champion the protective tariff as a means of furthering the exploitation of undeveloped resources and of enabling backward states to rise to the rank of a *Normalnation*. The road to normal nationhood was pointed out in his theory of economic stages. The first state to emerge from primitive conditions was the agricultural, followed by an agricultural and manufacturing state, which in turn culminated in the agricultural manufacturing and commercial state based on the complete utilization of productive forces. Once normal nationhood is reached, the educational function of the tariff will have ceased and free trade will prevail.

Both for his emphasis on the reality of the nation and for his advocacy of the protective tariff List is generally considered as the spiritual father of the Zollverein. He was also hailed as the prophet of advanced capitalism. The latter estimate is, however, only partially justified. For although he consistently urged the development of industrial resources and of the new means of transportation he believed that it was the duty of the state to regulate economic life as well as to curb individualism, and the subsequent over-industrialization would have seemed to him a distorted image of his ideal of a *Normalnation*.

LISTER, FIRST BARON, JOSEPH (1827-1912), English surgeon. After graduating in medicine from the University of London in 1852 Lister

went to Edinburgh to study surgery under James Syme. He became professor of surgery in the University of Glasgow in 1860, succeeded Syme at Edinburgh in 1869 and from 1877 to 1892 held the chair of surgery at King's College, London. Ignorant of the work of I. P. Semmelweis and O. W. Holmes on the prevention of puerperal fever and of Jules Lemaire's prior recommendation of carbolic acid as a chemical antiseptic, Lister, under the influence of Pasteur, after two years of experimentation on means of preventing suppuration in wounds published in 1867 his important papers (in *Lancet*, vol. ii (1867) p. 95-96, 353-56, 668-69), one of which was entitled "On the Antiseptic Principle in the Practise of Surgery." The intense and protracted antagonism to his innovation was due largely to the current ignorance of the germ theory, to the failure of other surgeons to attain similar efficacious results by the use of his methods and to rival techniques proposed by other contemporary authorities. Lister's erroneous insistence on the need for the antiseptic spray machine to create an antiseptic atmosphere surrounding the wound justified criticism and did much to delay the endorsement of his meritorious work, which, however, brought him international fame during his lifetime. Although the substitution of general asepsis for antiseptics in hospital practise was a direct development of his theory, Lister deplored the complicated and expensive precautions which it involved and persisted in his belief that the antiseptic method offered sufficient protection. Antiseptics remain an important aspect of surgical practise in military field hospitals, where it is difficult to achieve general asepsis.

BERNHARD J. STERN

Works: *Collected Papers*, 2 vols. (Oxford 1909).

Consult: Stern, Bernhard J., *Social Factors in Medical Progress* (New York 1927) chs. ix-x; Cheyne, W. W., *Lister and His Achievement* (London 1925); Godlee, R. J., *Lord Lister* (2nd ed. London 1918); Wrench, G. T., *Lord Lister* (London 1913); Dukes, Cuthbert, *Lord Lister* (London 1924); Garrison, F. H., *An Introduction to the History of Medicine* (4th ed. Philadelphia 1929) p. 588-92.

LISZT, FRANZ EDUARD VON (1851-1919), German jurist. Liszt was born in Vienna, the son of Eduard von Liszt, who later became general procurator. He made his career, however, in German universities; he was successively professor at Giessen, Marburg, Halle and Berlin.

Liszt achieved great fame as the leader of the sociological school of criminal law in Germany.

A Deutsches Reichs-Pressrecht (Berlin 1880) was followed by the first edition of the fundamental *Lehrbuch des deutschen Strafrechts* (Berlin 1881; 25th ed. by Eberhard Schmidt, 1927) and the founding in the same year of the *Zeitschrift für die gesamte Strafrechtswissenschaft*. In 1889 Liszt together with the Belgian Prins and the Hollander van Hamel founded the Internationale Kriminalistische Vereinigung (I.K.V.) in order to promote international activity in the investigation of the causes and the methods of control of crime. To serve the same purpose he later edited the *Strafgesetzgebung der Gegenwart in Rechtsvergleichender Darstellung* (2 vols., Berlin 1894-99), the first German exposition of the criminal law of all civilized peoples; this was the forerunner of the monumental *Vergleichende Darstellung des deutschen und ausländischen Strafrechts* (16 vols., Berlin 1905-09), in which Liszt was also a specially important collaborator. Liszt ventured too into the field of international law. Indeed his *Das Völkerrecht, systematisch dargestellt* (Berlin 1898; 12th ed. by Max Fleischmann, 1925) is a standard work on the subject.

Liszt was the initiator and champion of modern criminal law reform far beyond the borders of Germany. As the leading teacher of criminal law he gathered about him a large circle of pupils, many of whom now teach in Germany and elsewhere. In the criminological controversy of his time Liszt appeared as the advocate of clear sighted special prevention and as an extreme opponent of retaliation. He directed his attack toward the criminal himself: not the deed but the doer was to be punished. Among the many campaigns for specific reforms upon which he embarked may be mentioned his largely successful attack upon short term imprisonment.

ROBERT VON HIPPEL

Consult: Hippel, Robert von, and Lilienthal, Karl von, in *Zeitschrift für die gesamte Strafrechtswissenschaft*, vol. xl (1918-19) 529-34, 535-43; Hurwicz, E., "Franz von Liszt und die soziologische Strafrechtsschule" in *Neue Zeit*, vol. xxxviii (1919-20) 79-86; Goldschmidt, J., in *Archiv für Kriminologie*, vol. lxxiii (1920-21) 81-92; Dahl, Frantz, *Franz von Liszt* (Copenhagen 1919).

LITERACY AND ILLITERACY. The term literacy may relate either to a society or to the general mass of individuals within a society, according to whether its implied antithesis is preliteracy or illiteracy. In the first sense, a society becomes literate as soon as some group or caste within it begins to make written records.

In the second sense literacy denotes a condition which, with the possible exception of a few isolated instances such as the post-Diaspora Jews, has never acquired a normative value until the modern era. The analysis of literacy in ancient and mediaeval peoples must content itself with establishing the vocational and social groups in possession of writing and with speculating upon the factors tending toward its more general diffusion. A wide range of variation is revealed. Between the first introduction of writing among the oriental peoples probably in the fourth millennium B.C. and the decline of the Roman Empire, an imposing superstructure of learning, literature, science and philosophy had been erected upon the basis of literacy; but in the eyes of the cultivated classes literacy itself represented only the most elementary form of initiation. In any society developed beyond the stage where the ability to write is a sign of magical powers or an emblem of exclusiveness, literacy, once acquired, tends to assume the aspect of a faculty akin to sight and hearing and attention shifts to the objects upon which it is to be trained. The crucial problem, therefore, is to isolate the drives which in all civilizations have stimulated certain individuals to seek literacy and which in the modern period have impelled rulers and institutions to prescribe it.

Literacy, or what the ancients called the knowledge of letters, designates the ability to communicate through the medium of the abstract symbols of a script. Within such a definition there is room for a wide variety of emphases and interpretations. The Mohammedan peoples have in all ages tended to consider a person literate if he could merely read, while the ancient Egyptians, who worshiped their elaborate hieroglyphics as works of art, placed stress upon the capacity to write. Among all literate peoples prior to the invention of printing an important distinction existed between persons conversant with the calligraphic script, which was used for books, and those who knew only the cursive hand, which served for the ordinary purposes of business and social intercourse. Again it has been definitely shown that in the fifteenth and sixteenth centuries persons who could write were far outnumbered by those able to read. In particular it was long considered proper for women of refinement to be able to read books of devotion or romance as well as matters pertaining to household affairs but both unnecessary and ungentle for them to write. For all

people during the first three centuries following the invention of printing the compulsion for reading was distinct from that for writing. These varied interpretations are reflected today in the diversity of standards employed by different governments in collecting statistics on literacy. A realistic note has been struck in recent years in certain attempts to differentiate between literates and semiliterates, between effective and formal literates.

The development of the first systems of writing involved a process of conventionalizing pictographs, which are everywhere prevalent among primitive peoples, into an ideographic or semi-ideographic code. Wherever this took place, whether in Chaldea, Egypt, China, Crete or in a modified form among the Aztecs and the Mayas, it was accomplished by the presiding authorities of a highly centralized, relatively stable social and political organization; that is, by a royal or a priestly caste or through the cooperation of the two. The first uses made of writing are in line with its origins. The priests of Egypt and Babylonia inscribed on stone or clay the precepts of their religion; the kings of the same countries and of Crete, with an eye to their reputation with posterity, had the annals of their reigns published, sometimes on the flagstones which paved the palace temples, as in Babylonia, sometimes on their tombs, as in Egypt and Minoa. The business of the political bureaucracies early came to be transacted in writing: tax lists were drawn up; treaties were made; official correspondence was carried on—such correspondence as has been preserved in the Tel el Amarna letters of the fourteenth century B.C. The more complex the political and legal structure, the more the written documents multiplied: during the period when the whole Egyptian Empire was regarded as one vast economic organization under the administration of the court, an enormous number of people were required to keep the official accounts. These writers, whose stock in trade is analogous to that of the typist in modern society, although they sometimes functioned also as notaries, were the forerunners of the scribes of the Roman and mediaeval chanceries.

That the Egyptian aristocracy as well as the professional scribes was able to read and write is attested by the long prevailing custom of including among the burial objects papyrus rolls, by means of which the departed noble was to make manifest to Thoth, the god of writing, a command of the written word. But with the

growing commercial intercommunication during the second millennium B.C. the extension of literacy was the work primarily of the trading classes. The contracts signed by Babylonian traders as far back as the third millennium may be regarded as the prototypes of those numerous commercial documents which are to be found covering the centuries from 2000 to 1000 B.C., when Babylonian was the *lingua franca* through which merchants speaking varied languages communicated and made their written transactions. The final perfection of the proto-Phoenician alphabet around 1000 B.C. greatly facilitated written transactions and the keeping of commercial records, and during the period following the substitution of Aramaic for Babylonian as the international commercial language of the eastern Mediterranean the alphabet was transplanted to various cultures, such as the Greek, the Roman, the Arabic and the Indian, and in the process of adaptation to the needs of the different languages was gradually rendered more expressive. In a thriving commercial state such as fourth century Athens, the metics of the Piraeus, preoccupied with the practical demands of trade and shipping, used their literacy as a day to day tool, in a sense quite different from the more cultured citizen, who tended to regard literacy as the initial step toward a rather elaborate mental and spiritual culture. A similar utilitarian attitude toward literacy was manifested in a more ponderable fashion by the Korean shopkeepers and merchants of a later age, who adopted the easily written phonetic alphabet, while the scholars and government officials continued to struggle with the complex Chinese characters. In India at the present time the castes composed of merchants as well as of professional people reveal a higher rate of literacy than many of those above them in the social scale.

The first unmistakable evidence of a widespread popular literacy is in Ptolemaic Alexandria, although there is good reason to believe that the citizenry of Athens could in general read and write. From an analysis of various types of legal contracts it has been estimated that of the middle class populace of Alexandria 60 percent of the men and 40 percent of the women wrote Greek; to these must be added the considerable number of Alexandrians who wrote only Egyptian, which had been rendered less exclusive by the gradual modification of the cumbrous if beautiful hieroglyphs and the development, probably about 800 B.C., of the

cursive demotic script. An extensive reading public, a phenomenon which first emerged along with the commercial book trade in fifth century Athens, is indicated by the publication at Alexandria of large editions of chapbooks, *feuilletons* and allied types of popular literature. With the vulgarization of literacy in Athens and Alexandria the aura of magic which had continued even as late as the Homeric age to surround the written word was gradually dissipated. The increase in the size of the reading public was made possible by improvements in the technique of manufacturing papyrus, which could be manifolded far more easily than the clay materials of the Babylonians or the waxed tablets and potsherds still largely used in classical Greece for letters and accounts. Despite the technological improvements, however, the high cost of papyrus prevented its general use, while the parchment, which from the second century on gradually replaced it, was still more expensive.

The high percentage of literacy in such cultured urban centers as Athens and Alexandria cannot be taken as typical of classical antiquity as a whole. In the broad rural areas the mechanisms of oral transmission—the direct appeal to the eye and the ear—which characterize the preliterate tribal stage, were still operative with only minor modifications. The carpenter of Bethlehem, desirous of drawing to himself the fishermen of Judaea, traveled to them afoot and spoke to them as they drew in their nets. Even in the urban centers the fact that a large percentage of the people could read and write does not presuppose a premium upon literacy. Although Aristophanes derided the illiterate person as one devoid of the barest rudiments of culture, there is no indication that the ancient state, and little that the philosophers in their utopias, felt sufficient concern over the further extension of literacy to recommend official action.

This attitude of indifference is made explicit by Cicero: the general populace, if it should be so impelled by its daily needs, might become literate, but it was no concern of the aristocratic public servant steeped in Greek culture. That the Roman populace was so impelled may be inferred not only from the profusion of reading and writing schools (*ludi*), which supplemented the family system of instruction, but also from the extreme dependence of Roman civilization on general familiarity with the written word. A similar dependence in Athens may be revealed by future archaeological discoveries, which have already shown that Athenian laws

were proclaimed in writing, as had been the Code of Hammurabi in Babylonia; but the case of Rome is less conjectural. Not only were laws, treaties, decrees of senators and magistrates commonly published on stone, bronze or wooden slabs, but military orders were communicated in writing; soldiers wore armor or carried leaden sling bolts inscribed with letters; tiles used by the military forces in building their quarters were stamped with the name of the cohort; pottery makers cut their names upon their wares; announcements of official candidatures were painted on walls, as were advertisements of gladiatorial games and even of runaway animals; tokens (*tesserae*) for admission to public banquets and for the dole of grain bore the names and addresses of their holders; calendars and almanacs were prepared for the use of the farmers. At the beginning of the fourth century A.D. there were about thirty public libraries in Rome and several in the provinces. Among later emperors, such as Trajan, Alexander Severus and Diocletian, there is scattered evidence of an awakening sense of the advantages which might accrue to the state from a literate populace; but lacking any underlying theory, such sporadic attempts at dissemination of literacy may be regarded only as tenuous adumbrations of a still distant age.

The conditions of literacy in the Middle Ages are explicable in terms of the disintegration of the old Roman Empire and the simultaneous emergence of the Christian church as the civilizing agent of the western world. The body of sacred literature on which Christian dogma was built became the monopoly of the religious hierarchy; what the unordained man needed to know could be transmitted to him orally through the local priest. But the value of literacy for the hierarchy itself became increasingly apparent with the efforts of the church to imitate the administrative system of its imperial prototype. Moreover the molders of western monasticism, such as Benedict and Cassiodorus, not entirely liberated from the cultural standards of the Roman upper classes, incorporated the copying of manuscripts into the monastic routine. The scriptorium, with its patient scribe, became a common feature of every Benedictine as of every Irish monastery.

The cessation of economic intercourse and the transition to feudal anarchy during the early Middle Ages rendered obsolete important functions previously performed by literacy. Until the eighth century some commerce continued to be

carried on through the agency of Jews, Italians and Levantines; but after the closing of the Roman lake by the advance of the Arabs the literate account keeping merchant class disappeared and towns, at least north of the Alps, were virtually erased. The producer-trader of the Dark Ages who carried his goods a few miles to a primitive market place, where he haggled with other producer-traders, had no more need of the art of reading and writing than the inhabitants of the self-sufficient manor. The larger landowners and the more important lords and princes employed members of the clergy as notaries and scribes to keep their simple records. Until the crusades messages from one feudal lord to another were commonly conveyed by deputies who communicated them by word of mouth. The ambitious Charlemagne with his vast empire had exceptional reasons to regret his illiteracy; the Holy Roman emperor Henry IV seemed so remarkable to his contemporaries that they specifically recorded his ability to read a letter, "from whomsoever it had been sent." But for most lay potentates illiteracy involved little inconvenience. On the other hand, the idea of some cultural or spiritual initiation into the functions of the noble class was old in the feudal tradition; and as the relations of church and nobility became more closely knit, it was natural that the initiation might come to resemble clerical education. There is evidence that in the eleventh and twelfth centuries a great part of the nobility had acquired the elements of reading and writing Latin either at the monastic or cathedral schools, which existed for the education of churchmen, or from clerks resident on their estates. Isolated documents have sometimes been advanced to prove occasional mediaeval efforts to extend literacy to the masses: when analyzed, they usually signify only a renewed and unsuccessful attempt to exterminate illiteracy among the clergy, as in the case of Charlemagne's decree of 789, or an injunction to parish priests to teach their lambs to be good Christians—a discipline for which literacy was no prerequisite.

Italy, less clericalized than northern Europe, had managed, if less successfully than mediaeval Byzantium, to keep alive the ancient ideas of culture. With the rise of the universities of Bologna and Salerno there gradually spread throughout Europe an impulse which revived the legal and medical professions in their ancient form; the result was to extend the sphere of earthly functions which were felt to be rooted in a body

of written literature. A development still more far reaching in its consequences also appeared for the first time in Italy: as trade began to revive in the wake of the crusades and a new mercantile class evolved, the advantages of literacy for business purposes became once more apparent. It is probable that the Florentine merchant learned to read and write as early as the eleventh century. Two centuries later the Hanseatic merchants discovered the possibilities of the same instrument. These enterprising merchants who wished to emancipate themselves from the employment of priestly scribes were in fact pioneers in the struggle to separate educational facilities from church control. At first they apparently sought to gain entrance into the cathedral, monastic or parish schools; at a more advanced stage they brought about the foundation of municipal schools, which multiplied particularly in Germany, Holland and Denmark from the fourteenth century onward. Soon they found themselves in need of subordinates to keep their accounts and write their letters, and it became advantageous for lower strata to attend the reading and writing schools. Eventually they freed themselves not only from the priest but from the Latin tongue. From the fourteenth century on municipal and state documents as well as mercantile account books are written in the vernacular. Once the latter was conceived as a possible medium for writing as well as for speech, literacy lost much of its mystery as well as much of its difficulty. A Frankfort locksmiths' *Gesellenbuch* and numerous documents in municipal archives show that German artisans were not uncommonly able to write as early as 1400; and there is evidence that English artisans not only could write but were expected by their masters to do so. While Thomas More's estimate that "not three fifths of the English people" could read in his day was certainly not based on unimpeachable statistics, it is obvious that the dame, grammar, guild and charity schools were imparting a considerable degree of literacy. The regulations with regard to benefit of clergy indicate the same development. In England after 1351 the ability to read had entitled an individual to the privilege; when in 1489 the English government drew a distinction between members of the clergy and other literates, it appears to have been reacting against abuses resulting from the growth of literacy. Undoubtedly the late Middle Ages already reveal that tendency to use reading and writing as a tool which was to increase concomitantly with the progressive complexity of bus-

iness relationships and commercial intercourse.

To a certain degree all modern thought and activity with regard to literacy have been conditioned by the inventions of printing and of cheap paper, which made possible the slow transformation of western civilization into what Spengler has called a *Buch-und-Lesen Kultur*. Reading could never have become a common activity of the general public so long as the only book material remained the rare and expensive parchment and the only method of transmission the hand of the copyist. The careless, sometimes illegible cursive hand which in the fifteenth century rapidly replaced the Carolingian minuscules in itself reflects the inadequacy of the old mechanism of bookmaking, even for the restricted upper class circles who could afford books and had leisure to cultivate reading as an accomplishment. While it was on the whole to the learned and leisure classes that the religious literature, the romances and the humanistic writings composing the bulk of the incunabula were addressed, the inventions furnished the technical prerequisites for the genesis of an unlimited reading public, once conditions should impel the masses to learn to read.

The revolution which the emergence of these conditions constituted has been created by the coalescence of two factors: the shifting of emphasis to the common man, either because his interests were considered significant in themselves or because of his importance as a unit in a collectivity; and the increased stress on the written word as a medium of communication. These pressures were brought to bear by the Reformation. Precisely because it was a revolt against the authority vested in the institutional church the Reformation implied the invocation of a higher authority. In calling upon the Bible Luther took a course not unprecedented in the annals of heretical or semiheretical movements. The Waldensians, the Wycliffites, the Hussites, had likewise appealed from the personal to what the Jesuits contemptuously called the "paper" pope. Wycliffe and the followers of Huss had rendered the Bible into the English and the Czech vernaculars respectively; it had even been translated into German before Luther's time. The innovating force of the Reformation consisted in the extent to which Luther popularized the conception of the direct communion of all men with the divine through the written word.

To what extent the Reformation led in fact to the immediate extension of literacy is obscured in the mists of prestatistical times. It is

certain that it played the leading role in turning the printing press to the production of literature significant to the general public. Besides numerous editions of Bible translations in German, English, French, Swedish and Dutch the Reformation introduced an enormous supply of catechetical literature written in simple, easy language. It transferred the terrain of theological controversy from the learned tractate to the popular pamphlet. In the case of Germany it created the modern written language out of the speech of the market place and the peasant. Between 1516 and 1524 the number of presses printing in the German tongue increased ninefold; and before 1525 two thousand printings of Luther's writings alone had appeared. But the fact that the reformers at the very beginning of the warfare turned to the vernacular only serves to prove the previous existence of a wider sphere of literacy in the native than in the Latin tongue; as early as 1520 Hutten explicitly advanced this explanation for his abandonment of Latin. Perhaps the public addressed by the early reformers consisted in no small part of that merchant and industrial class which had already discovered the value of literacy for economic operations. Moreover in view of the generally demonstrated disinclination of the masses to seek literacy of their own volition at an appreciable cost of effort, any momentous change had to wait upon the organization of pressure from above as well as upon the creation of adequate schooling facilities. While Luther is generally considered the father of the German *Volksschule*, there is evidence that he, and certainly that Melancthon, divided between religious compulsion and the humanistic predispositions of the time, were interested primarily in secondary education. The decrees concerning popular education issued in the reformed German states during Luther's lifetime are remarkable for their sparing references to reading and writing. It was not until 1559 that a prince of Württemberg evinced a conviction that oral transmission was inadequate by insisting that reading and writing be taught and not until 1642 that such a function, from being a moral and religious duty, was transformed by a duke of Saxe-Coburg-Gotha into a political obligation.

But however tardily it may have become operative, the Reformation has been throughout the modern era a pervasive force in the propagation of literacy. The vitality of this force even today is demonstrated by the work of Protestant

missions in diffusing the Bible, now translated into four hundred different languages, among the unlettered peoples of Asia and Africa. Periodically recharged by pietistic awakenings or by the formation of new sects, the original impulse produced manifold movements in the seventeenth and eighteenth centuries for the eradication of the barriers between the common man and the fount of authority. In the Scandinavian peninsula, Denmark and Holland it constituted either the sole or the primary inspiration for the systems of parish and municipal schools which, even before the nineteenth century educational laws, made literacy a typical phenomenon among the natives of these countries. In England the first movement was organized in 1701 by the Society for Promoting Christian Knowledge, which "being touched with zeal for the honor of God and the salvation of the souls of the poor" founded charity schools to teach reading and writing. By the middle of the century, when the society was instructing about 50,000 children, the Wesleyans had begun to found schools; and from 1785 on the great Sunday school movement, initiated by Robert Raikes, taught reading and writing along with Methodist or Anglican religious principles. In Scotland the relation between the Sunday schools and the literacy of the poor cotter, who in Burns' poem "reads the Sacred Word," is direct. Humanitarian as well as religious teacher, Wesley wrote, edited and published a veritable library of literature suitable for popular consumption and including books of poetry, travel, etiquette, domestic economy, health and hygiene. The entire Wesleyan organization was converted into a gigantic book agency for the distribution of this literature, achieving such success that, according to one apologist, no Methodist home, however humble, lacked a Bible, a hymn book and the *Methodist Magazine*.

In most of the countries unaffected by the Reformation the mediaeval attitude toward literacy underwent relatively slight modification. The principal teaching order of the Counter-Reformation, the Jesuits, convinced that the Catholic hold on the masses was to be retained or recaptured only through the mediation of those in influential position, concerned itself almost entirely with the upper classes. Under the stimulus of competition in Germany, it is true, Canisius matched Luther's catechism with a Catholic document equally popular and some of the Catholic states made timid overtures toward the creation of schools. But no wide-

spread or successful attempt to disseminate literacy among the masses emanated from Catholic influence in any country prior to the nineteenth century, with the important exception of France. There a Catholic philanthropic movement, first manifested in the creation of teaching orders for the elementary education of girls, culminated in 1684 in the establishment by Jean Baptiste de la Salle of the Institute of the Brothers of the Christian Schools, which at its suppression in 1792 was instructing 36,000 pupils in reading, writing and the catechism. No doubt this order and similar agencies had some part in the growth of literacy in France during the eighteenth century; an audacious estimate of this growth, based on an analysis of marriage registers, indicates a rise from 29.06 percent for men and 13.97 percent for women in the years from 1686 to 1690 to 47.05 percent and 26.87 percent respectively between 1786 and 1790.

Probably, however, in France as in England and Germany the most notable extension of literacy in the early centuries of the modern era took place among the middle classes and was at first associated with the capitalistic revolution, the development of foreign trade, the improvement in systems of accounting and the repeated verification of the causative connection between pertinent information and economic rewards. Along with this process came a new stratification of literacy as well as of economic and social position. Since a favorable balance of trade in the mercantilistic state was thought to depend largely upon the supply of cheap labor, the entrenched interests discountenanced the teaching of reading and writing to the working classes, who might be lured by these instruments away from servile tasks and docile attitudes. Those who had attended a charity school or one of the fee charging reading and writing schools, such as the *deutsche Schulen* in Germany, the dame and grammar schools in England and colonial America or the writing schools in the cities of France, might "contemn," as an English writer said in 1763, "those drudgeries for which they were born." Not essentially altered when removed from the mercantilistic framework, this argument became perhaps the most important obstacle to the general dissemination of literacy. In its extreme form it inspired South Carolina in 1724 and several other colonies or states during the next hundred years to impose severe penalties for teaching the Negro to read and write.

It was in this climate that the apotheosis of

the diffusion of knowledge accompanying the popularization of natural rights philosophy was introduced. The "reading habit" was enormously expanded during the eighteenth century but, with a few exceptions, hardly beyond the limits of the middle classes. To their interests and predilections were addressed the new types of reading matter, the periodical, the daily newspaper, the novel, the libraries "devoted to things useful to mankind." The organized efforts of the English commercial booksellers to inculcate the reading habit were confined to the classes who could buy their wares and who had reason to hope for cultural or political improvement from perusing them. The stereotype of the "well informed man" appeared and deviation from it became stigmatized as a social delinquency, but the man was the bourgeois.

Despite the circumscribed limits of its immediate effect, however, the natural rights philosophy advanced the first elements of the ideology upon which the modern movement for the general dissemination of literacy has been based. Elevating the reasonable action and the earthly perfection of the individual to a height no less empyrean than Luther's ideal of religious salvation, it indicated a path to this goal scarcely more difficult than the reading of the Bible. In order to be saved from error man had only to read and know—a thesis succinctly expressed in Thomasius' *Einleitung in die Vernunftlehre* (first published in Latin in 1688), "wherein is pointed out, in an easy manner, comprehensible to all reasonable persons, no matter of what class or sex, the method of distinguishing between what is true, probable and false." Individual differences, inherited traits, counted for little or with Helvétius for nothing since external stimuli were all important in human development. While Voltaire, subscribing in general to this philosophy, might declare that it did not apply to the laborers on his estate, it inevitably focused attention upon the literacy of the masses, once it was fused with the idea that the relation of the common man to society was something besides economic. A temporary fusion was accomplished prior to the French Revolution, in the enlightened despotisms of Catherine II, Maria Theresa and Frederick the Great, although in the case of the last two religious and other considerations were heavily alloyed with enlightenment. But the revolution came with the advent of democracy.

While a long chronological gap intervenes between doctrine and fact because of the vicissi-

tudinous career of democracy itself, most of the important reasons for making general literacy a concern of the democratic state were crudely formulated by Condorcet, the most zealous advocate of popular instruction of the French Revolution. Drawing the implications of the democratic gospel of equal opportunity he showed, to use the words of Kant, that it was a "sin against the dignity of man, against humanity itself," to withhold from any individual the necessary tools for his own development. The second assumption which propelled the nineteenth century movement for compulsory literacy was associated with the transformation of the passive subject of monarchy into the active citizen of democracy: freedom from superstition, delusion, imposture and the disturbances of human passion—all to be attained through the diffusion of knowledge—became a condition of civic competence. Popular instruction became the conventional anodyne offered by democratic dogma for both the fears of the interests and the suspicions of the people. The argument for literacy gained strength with each additional movement or program to extend the suffrage; and it is significant that the utilitarians, the first loud advocates of universal suffrage in England, carried on a fervent campaign for the establishment of reading and writing schools. James Mill summarized the case by declaring that if a reading public were created in any part of the world, "the prejudices on which misrule supports itself would gradually and silently disappear."

The logic of democracy as expounded in England, America and France by the utilitarians, Price, Paine, Whitbread, Robert Coram, Benjamin Rush, Noah Webster, Nathaniel Chipman, Condorcet and Cermenin merged with the response of humanitarianism to the conditions produced by the industrial revolution. Urbanization, the deracination of peoples, the long hours attending the factory system, the absence of holidays, which had recurred at such frequent intervals in the mediaeval and early modern economies, and the division of labor, which, as Adam Smith pointed out, had obliterated the cultural value of daily work, had isolated the working classes from their traditional pleasures and vehicles of instruction. Some humanitarians, like Lancaster and Bell, whose monitorial systems provided a technique for mass production of literacy, the Anglican National Society (founded 1811) and the British and Foreign School Society (founded 1814) solved the problem by inculcating Bible reading. Others seeking to create a sub-

stitute for the pageants and spectacles of the village community wrote fiction for working class consumption. Brougham, the pupil of James Mill, attempted to apply the nostrum of the philosophers, the diffusion of knowledge. The net result was the appearance between 1810 and 1830 of enormous quantities of new reading matter modeled on the literature previously created for the bourgeoisie but reduced to a cheaper, more popular level. As the old regime had produced the *Mercure de France*, 1836 produced Girardin's *Presse*; Brougham's *Penny Magazine* of 1832 was the counterpart of the *Gentleman's Magazine* of 1731. That the masses themselves were becoming increasingly convinced of the value of reading is indicated by the extensive sales of the new literature.

Brougham is the typical representative of the point of view which finally overcame the opposition of the traditionalists and the economic interests and impelled the liberal state to assume the burden of promoting literacy through popular education. Addressing himself to the middle classes while organizing the instruction of the poor he sought to show the correlation between ignorance and discontent. When at the beginning of the eighteenth century the founders of the charity schools had defended Bible reading against the mercantilists and the Mandevilles as a method of preventing crime, their argument had carried little weight because the working classes, whether criminal or not, were still essentially economic robots. But rationalism and utilitarianism impinged upon the social consciousness in an era of popular tumult, riots and machine smashings. For these aberrations they presented both a diagnosis and a cure. Brougham himself, Hannah More and numerous other writers of popular tracts gave concrete evidence of the possibility of using the printed word to serve the interests of conservatism. Even so the forces of tradition were difficult to subdue. In 1802 a law was passed requiring that poor children "apprenticed" to factories be taught to read and write; select committees of the House of Commons from 1816 on revealed a "shocking degree" of illiteracy among the lower orders. But only the cumulative effects of mob turbulence and the new sources of terror arising from the extension of the franchise finally forced the interests to promote education as a means of teaching the working classes to "govern and repress their passions." The important advances in English elementary education during the nineteenth century came in 1833, one year

after the first Reform Bill, and in 1870, three years after the second extension of the franchise. The first official attempt to collect statistics on illiteracy was made in 1839, the year of the Chartist riots.

The forces affecting the growth of literacy in Europe had as a natural result of the transplantation of peoples and of cultures operated in modified form also in colonial America. Wherever a community of Dutch Reformed people settled or of Lutherans or of the German Reformed church or of New England Puritans or of Presbyterian Scotch-Irish, the influence of the church was exerted in spreading literacy; in colonial Massachusetts, Connecticut and New Hampshire public provision was made for vernacular schools, wherein the populace was initiated into the *New England Primer*, that abridged vehicle of Calvinistic orthodoxy which "taught millions to read and not one to sin." Agitation for general enlightenment of the masses began in the eighteenth century in the pamphlets of the radical democrats; but the resistance of the propertied interests combined with the influence of the frontier delayed determined consideration of the problem until after the first quarter of the nineteenth century. Following the introduction of universal suffrage in 1828, however, when the propertied classes were more susceptible to any proposal that promised to safeguard political stability, the democratic and humanitarian propagandists succeeded in popularizing the ideal of universal elementary education and ultimately in effecting the establishment of free, compulsory primary schools throughout the greater part of the country.

The first American statistics on illiteracy were collected by the census of 1840, one year after the English estimate, which had been based on the number of persons unable to sign the marriage register; in the outburst of liberal sentiment which culminated in the July revolution and produced the elementary education law of 1833 the French minister of Public Instruction had published as early as 1827 data derived both from the marriage register and from figures relating to conscript soldiers. As democracy became actualized, propelling a continuous trend toward universal instruction, the problem of illiteracy transferred from the realm of theoretical controversy to that of administration tended to become the monopoly of bureaucrats and statisticians or of private agencies cognizant of fields untouched by public education. While the figures are neither precise nor, as between coun-

tries, comparable, it may be stated with reservation that in England the percentage of illiteracy fell from 33.7 for men and 49.5 for women in 1839 to 5 and 5.7 respectively in 1893 and in France from 55.2 between 1827 and 1829 to 5.7 in 1894. In the United States despite the effects of immigration the rate had declined to 10.7 percent in 1900. Belgium, influenced by French political forces and ideology, reduced its rate from 51 percent in 1840 to 14 percent in 1894.

In the German states the eradication of illiteracy during the nineteenth century was motivated by a force no less compelling than democracy—the nationalistic fervor first engendered by the impact of the French Revolution. The stress laid, for instance, by Fichte upon the cultivation of the human resources of the nation implied the same policy toward literacy as did the drive to exalt the national literature by enshrining it in the hearts of the common people. Although greatly diluted in the process of transmission to the political authorities these ideals finally resulted in the establishment in Prussia and ultimately throughout Germany of systems of compulsory education, giving effective form to a principle which largely under the influence of Protestantism had been accepted in most of the German states by 1800. Since, in the words of Baron von Altenstein, the government assumed the responsibility of "making the common man's lot agreeable and profitable to him" without "raising him out of the sphere designated for him by God and human society," the dissemination of literacy encountered little opposition from the upper classes. It proceeded with few complications until in 1893 and 1894 the percentage of illiteracy among the conscripts enrolled in the imperial army was only .24. Since 1913 the German authorities have considered it unnecessary to take statistics.

During the course of the century, as the general levels of national culture became an object of attention, the literacy rate was widely regarded as one of its most significant indices. Economic, religious and political explanations for the difference in rates between northern and southern Europe were overlooked and the conviction grew that illiterate peoples were, if not inherently inferior, at least unredeemed. Under the influence of the assured threat to the national literacy rate and of the assumed threat to American standards of civic competence the United States Congress in 1917 passed over the president's veto a law imposing a literacy test upon

all immigrants and operating, as a precursor of the immigrant law of 1927, to exclude natives of southern and eastern Europe.

The literacy test for immigrants represented a borrowing from a practise already associated with suffrage laws both within and outside the United States. Throughout the greater part of its history the literacy test for voters has been used as a weapon against specific groups which for some reason or other were considered dangerous to the dominant group. Its convenience as a method of restricting the suffrage without violating the fundamentals of democratic dogma, since the latter could be interpreted as implying universal literacy, was recognized as early as 1795, when it was incorporated into the constitution of the year III in order to keep the *sans-culottes* from the polls. Under somewhat analogous circumstances certain of the South and Central American republics, notably Brazil, have resorted to the same device. In Europe it has been used chiefly in countries where literacy was largely restricted to the upper classes, such as Portugal, which in 1872 had an illiteracy rate of 82 percent, Italy, which in the same year had a rate of 69 percent, and czarist Russia; and in such countries it might justly be called "pedantic" or "mandarinal." In the United States it was first introduced in Connecticut in 1855 and two years later in Massachusetts, the occasion being the inpour of tumultuous Irish immigrants and the organizers of native American indignation being the Know-Nothing party. When the earlier devices for nullifying the effects of the Fifteenth Amendment were becoming outworn, most of the southern states, beginning with Mississippi in 1890, instituted literacy tests, usually combined with ingeniously phrased alternatives in the form of grandfather or property clauses, which it was hoped would exclude the Negro without affecting the illiterate white. Of the other tests which have been imposed in the last forty years in New York, Wyoming, Maine, California, Washington, New Hampshire, Arizona and Oregon the New York test, which is administered under the supervision of the state department of education and attempts to examine functional rather than merely formal literacy, is generally regarded as the most effective.

The countries outside the sphere of greatest literacy did not remain entirely unaffected during the nineteenth century by the formulation of the new standards. While America, England and France, unsatisfied with the promise of

future improvement held out by their compulsory education laws, were beginning to attack the problem of adult illiteracy, countries like Japan, Italy and the Balkan states, aspiring to gain a competitive status in the family of nations and linking the eradication of illiteracy with escape from economic exploitation, made attempts of varying success to create systems of universal elementary education. In the case of the minorities of the former Hapsburg, Turkish and Russian empires the movements against illiteracy, although until recent years they failed to make much headway, were an integral part of the larger technique of nationalist revival, which depended in its beginnings upon the dissemination of national literatures and upon the resurrection of the national languages. Similar manifestations have occurred among the Irish and the Flemish, who have sought to perpetuate their native tongues by making them written languages rather than merely spoken dialects. Conversely, the political entities embracing minorities have sometimes looked to the inculcation of literacy in the official language as a method of checking the centrifugal forces of a heterogeneous population.

In a spectacular fashion the World War focused attention upon the problem of illiteracy, which became a factor of immense moment in the propagandizing efforts accompanying the unprecedented mobilization of national resources. The recent American movement against illiteracy, including the immigration law of 1917, the proliferation of agencies for adult education, the holding of sectional conferences, the organization of the ardent National Illiteracy Crusade and the eventual creation of the National Advisory Committee on Illiteracy in 1929, may be traced to the discovery that 24.9 percent of the American soldiers were functionally illiterate and to the inference that a still larger proportion of the American public was immune to the propaganda being broadcast by newspaper and signboard. The political changes which followed the war have also operated to give impetus to the movement against illiteracy in the so-called backward nations. The new republics of Europe, subjected to the force of democracy, have been further spurred on by the prestige of western standards. In China the Mass Education Movement, which dates back to the westernization campaign of the first decade of the present century, began in the period following the war to conduct a more efficiently organized offensive against illiteracy. Its construction of a

simplified code of ideographic symbols in the most widely used popular dialect (*Pei-hua*), which has partially overcome the staggering difficulties of the Chinese written language, has been supplemented by a concerted movement to produce translations, new works and newspapers in the vernacular. But no civilized country with the exception of India is besieged by more forces antipathetic to the spread of literacy than China: the lack of responsible government, the bankruptcy of the system of taxation, civil dissension, undeveloped national resources, an enormous preponderance of rural population, heterogeneity of language, have all acted to prevent even the gathering of statistics on illiteracy. Turkey, facing a similar mechanical problem in the complexity of its script, has adopted a Latin alphabet of twenty-nine characters and through the establishment of national schools is making progress in educating its largely illiterate populace.

Perhaps the most sustained and comprehensive attempt yet made to "liquidate illiteracy" is being carried on in Soviet Russia. Until the time of Peter the Great the Greek Catholic church held somewhat the same monopoly of literacy as the Roman church in mediaeval Europe; *diak*, the Slavic term for churchman, became the designation of the scribe as "clerk" had in western Europe. In spite of the sporadic efforts of Peter and of Catherine, the former motivated by his conception of westernization and the latter by the ideas of the Enlightenment, to disseminate elementary education it may be assumed that in 1783 the percentage of illiteracy was at least equal to that of the rural population—about 94 percent. The attempts of various shades of humanitarian reformers to reduce this deplorable percentage provoked on the part of the repressive czarist regimes measures of retaliation, the violence of which was aggravated by the close actual interrelation between the intelligentsia, especially the *narodniki*, and revolutionary movements. According to the census of 1897 the percentage of illiteracy was 78. The modern movement, inspired by Lenin's dictum that without literacy "there can be no politics, there can be only rumors, gossip and prejudice," has set out to create the necessary foundation for the Soviet campaign of "political and economic enlightenment." Through the innumerable "liquidation points" which have been founded in community houses, factories, shops and village reading rooms the Soviet government is progressively reducing the per-

centage, 43.3, indicated by the census of 1926. Between 1913 and 1928 the circulation of newspapers increased from approximately 2,500,000 to 8,250,000. An interesting experiment has been made in the manner of dealing with the languages of minorities, many of which have under the Soviet government been committed to writing for the first time; by carrying on education in seventy different languages the government has complicated its own problems but greatly curtailed the difficulties confronting the illiterates themselves. Fascist Italy also illustrates the successful adoption by an antidemocratic movement of a technique tried and proved in the political milieu against which it is a reaction. It is probable that the percentage of illiteracy computed at 28 percent for 1922 is being progressively reduced as a result of the reforms undertaken under the supervision of Giovanni Gentile.

Modern statistics on illiteracy are available for little more than half the population of the world—the principal lacunae being in regions of Asia, Africa and South America, where literates undoubtedly represent trifling minorities. But figures on illiteracy even when derived from the most efficient of statistical inquests provide precarious bases either for comparison or for deductions as to their absolute validity. The margin of error, far from negligible in the case of the most comprehensive basis, the census, becomes magnified when the rate is obtained, as in England, from the marriage register, which in the year taken in the table concerned only 1.5 percent of the total population. Variations due to the minimum age considered are also significant: in Bulgaria, for instance, when the rate of illiteracy in 1920 is computed as a dividend of the total population, it is 55.54 percent; as a dividend of those over five years of age it is 50.47 and of those over ten, 46.75. A specific age group may reveal a rate widely divergent from the total rate: thus in Russia according to the census of 1926 only 4.3 percent of men twenty-four and twenty-five years old and 11.8 percent of women of nineteen were illiterate. In many countries, such as Russia, India and regions formerly under Moslem domination, sex affects the literacy rate: the Indian census of 1921 showed 16.1 percent of males over ten and only 2.3 percent of women to be literate according to the relatively stringent criterion imposed. Total rates also obscure the factor of regional distribution, giving no indication of the often tremendous disparity between urban

| POLITICAL DIVISION | DATE | GROUP COVERED | PERCENT- AGE OF ILLIT- ERACY |
|-----------------------|---------|---|---------------------------------------|
| Europe | | | |
| Belgium | 1920 | 8 years of age and over, unable to read and write | 7.9 |
| Bulgaria | 1920 | 10 years of age and over, unable to read or write | 46.7 |
| Czechoslovakia | 1921 | 7 years of age and over, unable to read and write | 7.0 |
| Denmark | 1921 | Of school age and over, unable to read and write | 0.1 |
| England and Wales | 1924 | Signing the marriage register by mark | 0.3 |
| Finland | 1921 | 15 years of age and over, unable to read or write | 30.1 |
| France | 1921 | 10 years of age and over, unable to read and write | 8.2 |
| Hungary | 1920 | 6 years of age and over, unable to read and write | 15.2 |
| Italy* | 1921 | Over 6 years of age, unable to read | 28.0 |
| Netherlands | 1918 | Signing the marriage register by mark | 0.3 |
| Poland | 1921 | 10 years of age and over, unable to read | 32.8 |
| Rumania | 1920 | 10 years of age and over, unable to write | 45.0† |
| Scotland | 1923 | Signing the marriage register by mark | 0.3 |
| Spain | 1920 | 10 years of age and over, unable to read and write | 42.9 |
| Sweden | 1921-22 | Liable to military service, unable to read and write | 0.2 |
| Switzerland | 1906-10 | Signing marriage register by mark | 0.4 |
| U. S. S. R. | 1926 | Above 7 years of age, unable to read and write | 43.3 |
| North America | | | |
| Canada | 1921 | 10 years of age, unable to read | 5.1 |
| Mexico | 1921 | All ages, unable to read and write | 62.2 |
| United States | 1930 | 10 years of age and over, unable to write in any language | 4.3 |
| South America | | | |
| Argentina | 1913-24 | Average of conscripts and enlisted men | 24.0 |
| Brazil | 1920 | 5 years of age and over, unable to read and write | 71.2 |
| Chile | 1920 | 5 years of age and over, unable to read | 40.8 |
| Asia | | | |
| India | 1921 | 10 years of age and over, unable to read and write a short letter | 90.5 |
| Japan | 1925 | Conscripts unable to write and figure | 0.9 |
| Africa | | | |
| Egypt | 1917 | 5 years of age and over, unable to read and write | 92.0 |
| Union of South Africa | 1921 | All ages, unable to read and write | 90.3 |

F. Abel and N. J. Bond, *Bulletin*, no. 4 (1929).

and rural illiteracy. Again, the amount of illiteracy figuring in the total may in large degree be the share of a particular group, such as the Negroes in the United States. Despite the reduction of almost 50 percent in Negro illiteracy between 1880 and 1920 as a result of the opening of public educational facilities to Negroes, the rate in 1920 still hovered around 22.9 percent. But even when these and other factors have been weighed, the statistics still fail to measure the numbers effectively rather than merely formally literate.

Once literacy has been generally diffused among the masses of a society, it tends to become indispensable to the social process and the nonconformist is penalized by isolation. Rousseau omitted reading and writing from Émile's youthful education, satisfied that Émile would seek these arts of his own accord as soon as he

came into touch with the literate world. Besides multiplying the uses of writing, the diffusion of literacy atrophies many of the mechanisms of oral communication which except in periods of general maladjustment spring up spontaneously in societies predominantly illiterate. The press superannuates the town crier; the peripatetic minstrel disappears as the circulating library grows. But while the individual in an illiterate society is likely to have more contacts with the group than the illiterate in a modernized society, these contacts are, in the ordinary course of events, limited to a narrowly circumscribed environment. As one of many social and technological factors accelerating communication, the diffusion of literacy has played an important part in the breakdown of barriers between atomistic groups and in the expansion of the range of stimuli to which the common man

is exposed. The faith of the early nineteenth century that "reason" and content would necessarily flow through the new channels of communication provided by literacy is still echoed: in twentieth century America strikes have been laid to uncontrolled passion and the passion itself to illiteracy. However misguided the faith appears when accompanied by its premises, it would be rash to say that the nineteenth century advocates of literacy were wholly wrong in their conclusions. The two outstanding recent revolutions have begun in countries with large percentages of illiteracy and perhaps in their campaigns for liquidation the revolutionary governments now established only prove their awareness of the human tendency to give assent to the written word, whether the word speaks for tradition or for innovation.

LITERATURE. Viewed as a whole a body of literature like a body of magic or a system of law is part of the entire culture of a people. The characteristic qualities that distinguish it from other literatures derive from the characteristic qualities of the life of the group. Its themes and problems emerge from group activities and group situations. Its significance lies in the extent to which it expresses and enriches the totality of the culture. Although the groups with which anthropology ordinarily concerns itself are preliterate, the functionalist standpoint as developed in anthropology is illuminating when applied to the setting of literature in a culture. Viewed thus literature is neither

an esoteric activity, as the formalists would contend, nor a purely instrumental activity, directed to external ends in the group life, as the extremist element in the Marxian school would have it. It is an integral part of the entire culture, tied by a tissue of connections with every other element in the culture; yet possessing a function of its own and ministering best to the life of the group where it performs that function with the greatest artistry and the deepest congruity with the basic assumptions and the accredited purposes of the group. And it should be added, to point the complexity of relationship, that these basic values are not something given but are the end products of a past in which literature has itself played a substantial part in the process of cultural construction.

Literature is thus both culture forming and culture ridden. Its connections with society are so integral and pervasive that there is a temptation within every sociological school of criticism to press to the conclusion that society is the play itself and not merely the backdrop against which the play is enacted. Certainly the range of social influences on literature is as broad as the entire range of operative social forces: the prevailing system of social organization—including the class structure, the economic system, the political organization and the deeply rooted institutions; the dominant ideas; the characteristic emotional tone; the sense of the past and the pattern of the future; the driving aspirations and "myths," and their relation to the contemporary realities. There is nothing in the compass of social life that does not play its part—small or large, directly or by deflection, immediately or by varying removes—in giving literature the impress of its surrounding world.

The sort of determinism which this involves is not, however, the rigid and mechanical determinism that has played havoc with the charting of relationships in the entire realm of social life. It cannot afford to isolate a single element in society—whether economic or ideological—and assign to it a causal role in the final determination of literature; nor can it premise an immediacy of relation between literature and the social factors or a quantitatively equal response to the impact of social forces. The whole of the social process—including material, conceptual, emotional and institutional elements—may be regarded as containing the potential determinants of the direction and character of

the literature of a period. At any time the pace and character of social and intellectual change sharpen issues, pose problems, precipitate conflicts and establish harmonies that are distinctive for that time; a "social situation" is brought into the area of operative influence which, in its selection of elements and in its orientation, is unlike any other social situation. And while this selective process is projecting certain dynamic and significant issues into the consciousness of the time and obscuring others, another selective process is at work, from the side of the writer, singling out those elements which have managed to produce an impact on him and weaving them into a pattern which is compatible with his standards of art and his view of human life. Where these two mechanisms of selection interlock in the work of a particular writer a point of contact is established between literature and society.

In terms of such a dynamic and selective process some justice can be done to the subtle and complex connections that link literature to the operative social whole. Critics who attempt to test the hypothesis of a socially determined literature by measuring the degree to which certain great writers were absorbed in the public issues of their day set up a mechanical unilinear determinism which they find no difficulty in destroying. Thus it might be shown that Chaucer's poetry is a poor mirror of the more obvious political issues of the England of his day, and that even Shakespeare was alive to the glory of the victory over the Armada but not to the realities of the enclosure movement. But such a line of inquiry assumes a simplicity that does not exist in the functioning of the social process. Any appreciable change in the social process communicates itself to the body of literature not directly but through a ramifying network of social relations, with every chance that its force may be multiplied or deflected in the devious process of transmission, or that its influence will be complicated, distorted or nullified by some other change arising elsewhere in the social process. For society is neither neat structure nor unobstructed process: it is a complex of end products from the past, of functioning institutions in various stages of development, of tangled idea and emotion, of hesitant purpose and frequent cross purpose. In such a milieu the surprising fact is not that there is so little clear evidence of the transmission of social change to the literary process, but that there is so much. In the case of particular

writers the relation seems of course even more erratic than in the case of a body of literature. For to what extent the social process will push its significant changes across the threshold of the writer's consciousness, and to what extent he will embody even that proportion in the emotional pattern that constitutes his artistic vision, can be explained only by the conjunction of his own biography with the history of the society.

The essential task of literature is to lay bare the foundations of human emotion: to this revelatory process the social forces can give only direction, impetus and an ideological impress. It is a commonplace of criticism that literature transcends the boundaries of the particular culture, that it speaks "the universal language of the human heart." Whatever the culture, its basic literary themes are the same—birth and death and love and jealousy, individual conflict, communal experience, triumph and defeat. They are linked to the biological bases of life, to its psychological invariances, to the necessities of the collective experience. It is significant that the literatures of the most varied cultures have meaning and beauty for an outsider even when their social organizations seem to him bewildering and their basic values absurd. For the artistic imperative to which literature is the response is universally operative. Everywhere the writer takes the stuff of experience in the life of the group and washes it in the powerful emotional stream of his personality. The drab incident is made vital, the abstraction human and dramatic, the idea imaginative. Homer's gods survive across the centuries because they are humanized; Dante's theme of divine love is made immediate and dramatic; and the group activity that is the theme of modern proletarian writing is translated into terms of its incidence on individuals. For the literary process society is only the river bed; the stream is the flow of human life.

In fact the two processes are scarcely as distinct as that. The emotional pattern of the individual writer, which could claim, if anything could, to be a primary datum, is as a matter of actuality socialized in the very process of construction, and the individual artistic vision is a selection from potential elements; the emotional response of the reader is the product, as Tolstoy points out, of a sort of social contagion and certainly proceeds in an emotional milieu already socially conditioned; the valuation of the writer and the guidance of the reader—

the dual task of a highly subjective body of criticism—proceed by canons which, to avoid being chaotic, must be socially rooted. Literature is whatever reaches through words to the human; but in the process the entire social realm must be traversed.

Literature is seen in clearest social perspective as an institution—a cluster of structure, usage, habit, idea, technique—the whole containing a principle of growth of its own but responding always to the change and stir in the varied life of the institutions with which it is interwoven. And as such it consists of a scheme of controls, through which it performs its social function by organizing the verbal expression of experience and thus integrating on an emotional level the activities of the group with its underlying view of life.

The basic material of literature is thus experience. But the experience that has found expression in literature has never been as broad as that of the entire culture. It is always a limited experience that is thus embodied—the life and the vision of life of particular groups within the culture. In the literature of Periclean Athens it is the experience of the male citizenry that is expressed, but not of the metics or the slaves or the women; in the literature of imperial Rome it is the experience largely of a leisure aristocracy and not of the industrial population or the serfs or, with some exceptions, of the provincials; in the literature of mediaeval Europe it is the experience only of a fighting, jousting and love making nobility; in the literature of China it is the experience of a high officialdom or of a petty bureaucracy, but not of the masses of peasantry. Sometimes the confines of expression have been determined by the class groupings, sometimes by the distribution of literacy and leisure, sometimes by arbitrary and traditional tabus. In fact literary history could be approached illuminatingly from the point of view of the forces that have drawn various groups and strata of the culture into or kept them out of the body of literary expression. In the western world there has been since the breakdown of feudalism a steady extension and widening of the limits, so that new groups have been continually drawn into the literary process—first, generally, as readers and then as writers. The entire period since the commercial revolution has been dominated by the rise of the middle class to the literary hegemony in the new capitalist nation states that

succeeded the feudal regime. And the anticapitalist revolutionary movements of the last hundred years have carried with them, both as result and as an integral part of their purpose, the opening of channels of expression for the experience of the underlying population—from the workmen's literature of Chartist England and of the France of George Sand to Gorki's delineation of the life of outcasts in czarist Russia on the eve of the revolution and the direct and unvarnished writing of worker correspondents in Communist Russia.

The large tidal changes in making new and untapped resources of experience available for literary expression have resulted from changes in class stratification. Another accession of experience, that of women, was made possible by the breaking down of the tabu which women's inferior economic position had placed about the masculine monopoly of writing; the timidity with which Jane Austen and Emily Dickinson wrote indicates the gap between their period and that of the present when it is often possible for a woman to have, in Virginia Woolf's phrase, "a room of her own." But tied up with these changes affecting class and sex groupings there have been shifts of intellectual horizon, contacts with hitherto unfamiliar cultures, reorientations in the effective moral codes, which have broadened and deepened the experience of the entire culture and which have uncovered new levels within the individual consciousness. The effects of the crusades and of the Renaissance on western European literature, of the geographical and scientific discoveries on Elizabethan literature, of the rise of urban life on the eighteenth century novel, of European expansion into the exotic regions of the Far East on late nineteenth century French literature, of the disintegration of rigid bourgeois morality upon the entire range of western literature at the turn of the twentieth century, as exemplified especially in Hardy, Ibsen and Dreiser, and of psychoanalytical research and speculation on the modern novel are instances of how the large and pervasive social forces uncover new strata of experience. The forces mentioned are of course in no sense primary or crucial; they are themselves merely links in the endless interlocking chain of causation and concomitance that constitutes the process of history; but from whatever source they proceed, the part they play in broadening, enriching or impoverishing the field of human experience constitutes their primary significance for literature.

Literature in turn in organizing this experience in language patterns heightens it as well; it selects and points out evocative values not appearing on the surface. But to do this consistently requires more than a philosophic or deeply human sense of values, although that is indispensable. It requires also a preoccupation, much like that of the philosopher or the scientist in his own realm, with the dramatic and significant in human behavior; a disciplining of sensitivity and perception; a familiarity with a far flung body of traditions; a mastery of a technique. In this sense literature takes on the apparatus and the conscious scrupulousness of the other arts. Vergil's desire, after years of constant polishing of the lines of the *Aeneid*, to destroy the whole poem at his death because some passages still remained inferior and Flaubert's balancing of *le mot juste* are merely the more familiar instances of an inherent pressure toward refinement in the literary process. The result is the differentiation of a specialized literary group from the main stream of the activities of a culture. Such a group tends to become intellectually ingrown and to narrow the field of its exposures. Euphuism and Gongorism, the schools of Donne and of Rimbaud, the barriers within which Joyce or the Sitwells or Gertrude Stein enclose their incommunicable symbols, are end products of the introversion that is implicit in every stage of the building of a literature. Here as elsewhere in the culture process the inner impulsions of a specialized discipline must be reconciled with the larger demands for growth and freshness.

Literature thus faces continually the need for rebarbarization. In terms of the response to that need many of the excursions into new regions of experience take on meaning. The most persistent of these has been the recurring cult of the folk and the folk mind. The folk itself is rarely drawn into the ambit of literary expression, except indirectly through the frequently sentimentalized mediation of "literary" treatment. But it does find its expression orally in ballads, tales, heroic songs, fables, proverbs, gnomic sayings and legends. Whatever its origin, this folklore or folk literature grows by repetition and accretion and constitutes at any time the larger proportion of the verbal expression of a culture. In periods before the formation of a literary language, as in Russia's dark centuries before Lomonosov, and among groups cut off by economic subjection, isolation and illiteracy from individualized literary

expression, as with the peasant populations of Europe and the American Negroes and hill folk, the folk literature is the only literature. Because such folk expression appears to rise straight from a deeply rooted experience and because it appears to be the product not of a single great individual talent but of successive generations living highly patterned and custom encrusted lives, writers and critics have found in it a vigor, an immediacy and a refreshing sincerity that they have commonly found wanting in the "literary" literature. Since the mediaevalist movement of the eighteenth century this admiration of the folk mind has played a large part in critical thought and in literary expression. That Goethe and Grimm expressed great admiration for the Yugoslav folk ballads was as characteristic of their day as the contemporary American interest in Negro spirituals. In fact many have found in the folk mind the source not only of the folk literature but ultimately of all literature. In the wake of the romantics nineteenth century literary theory held that the literature of mediaeval Europe was not the result of individual creation but was forged in the rich life processes of the mediaeval folk. This is now radically questioned, and the acceptance of Bedier's researches on the origins of the *chansons de geste* would indicate a tendency, at least in the case of the more sustained literary works attributed to the folk mind, to emphasize the creative role of particular individuals in gathering and fusing into an individualized expression what must in the beginning undoubtedly have been traditional folk material.

It is not difficult to find in the intellectual stream since the early eighteenth century the currents which have produced the emphasis on the folk mind. The cult of nature which found expression in the Lake poets as well as in Rousseau and the *philosophes*; the differentiation between the simple sincerity of the rural mind as contrasted with the civilization-contaminated life of the cities; the construction of a "noble savage" whose idyllic happiness flows from his obedience to "nature's simple plan"; the discovery by nineteenth century anthropologists of primitive civilizations, whose tightly knit cultural integrity lay in the dominance of custom and the supposed subordination of the individual to the group, and the idealization of the European peasant by intellectual and literary groups as far removed as Tolstoy and the Russian *narodniki*, Hamsun and the earlier Ibanez

—these were not so much the forces behind the folk cult in literature as themselves a related expression of deeper lying social forces. A function of rebarbarization similar to that which contact with the folk spirit has performed for the literary mind has been performed also by cults of the heroic, from the eddas and the Homeric heroes and the Prometheus legend to the Napoleon pattern in European literature and the superman philosophies of Carlyle, Emerson and Nietzsche. More recently a new primitivism has arisen, largely under the stimulus of anthropological researches into primitive art and sex life and imperialistic contacts with primitive groups, and constituting something of a literary Gauguinism. In another realm of experience many writers, following in the wake of the Freudian researches, have plunged into the jungle of the submerged and repressed sexual impulses; or have, like D. H. Lawrence in *Lady Chatterley's Lover* and James Joyce in *Ulysses*, broken down the tabus that, through moral codes and through the more directly institutionalized forms of censorship, have in the western Christian civilizations hedged about the exploration by literature of the physical sexual experience. All these literary allegiances—to the folk mind, to the hero cult, to the primitive mode of life, to preoccupation with sex activity—spring in common from the continually felt need for the rebarbarization of a literature in which the experience represented is continually threatening to grow thin. But they differ from the large movements which brought the experience of the middle class, the proletariat and women within the range of literary expression; they do not represent on the part of the writers a direct exposure to new areas of experience. They are derivative and vicarious. They have been as much escapes from experience as accessions of it.

Before a developed technique emerges in any literature even the best of individual achievement is but random expression, and whatever progress it has made in charting experience may at any time slip away again. In this sense the accumulated technology of literature—what may be called, in paraphrase of Veblen, the state of the literary arts—becomes part of the social heritage. All literary technique is concerned in some way with the manipulation of words and word patterns. The word, with its sound values and its emotional connotations, is the basic constituent of the technical apparatus, just as experience is the material to which it is

applied. Language may thus be regarded as implementing literature, and, as Bouleau emphasized, the richness and flexibility of a language will often condition the potentialities for greatness in the literature which is linked to it. The crude stage of the Roman language, as reflecting the undeveloped culture of Rome, at the point when Ennius first attempted to force it into the complicated literary molds of Greece, accounts in no small part for that lack of *ars* with which the more flexible Augustans taxed him. The emergence of literary expression in the vulgar tongues of the Romance nations had to wait upon the slow process of linguistic evolution in which the competing languages attained at least a rudimentary balance. The advance represented by the French in France and the English in England is inescapable without an understanding of the immediately preceding or accompanying climax in linguistic development. Much of comparative literary criticism has concerned itself with such contrasts of the basic linguistic materials and their effect upon literary expression. But on the whole it is probable that most of what seems thus in the nature of linguistic differences may be referred back to differences in the texture of the culture. For while it is conceivable that words should serve only as quasi-mathematical symbols of communication and that whatever emotional values they ultimately contain should derive from their technical handling and their literary patterning, it is actually true that the words themselves come already laden with pleasure values and with connotations out of the culture. It is upon this sensitive structure of connotation that the literary artist builds his superstructure of emotional values, and he often finds that because the words that he uses are already emotionally tinged they are not bare obedient instruments of his will but living things whose accents from the culture are hostile to his purposes. Language may thus be as much an obstacle as an aid to literary expression.

The literary technician arranges his language in word patterns, among thereby to achieve patterns of sound and thought which are emotionally evocative. Rhyme, rhythm, and assonance being in the first category, imagery and *idea* in the second. These technical elements may be combined into further patterns, as in the sonnet, the ballad, the classical ode, or the epic poem. These larger patterns may vary from a more or less rigidly determined mold,

such as the sonnet, to the larger literary types or genres, such as the drama or the novel. As technological forms these elements are products of a process of invention and development which must have involved a succession of individual experiments and adaptations, each building on the level previously reached. Brunetiere placed a good deal of hope in a natural history of literary forms and styles, but the suggestiveness of his prologomena was never fulfilled by the results of his research. With few exceptions the origins are lost in the mist of history, and the developments upon them proceed by almost imperceptible gradations or, obscured in the creative process, elude all attempts at isolating them. The origins of the early clusters of nature legends, which may be found in very similar forms in Egypt, Babylonia, India, Judaea, Greece and the Celtic and Teutonic tribes, their relation to each other and the method by which they reached their historical distribution are still extremely controversial. With the epic there emerged a highly developed literary form, which winnowed and re-sorted the ballad clusters that had grown up about the myth legend content. But the processes by which these ballad clusters were forged into the formal epics are only dimly charted, as is also the transition from the dithyramb to the tragedy and from the village satiric songs to the comedy. With advancing research the origins of the novel and the short story are being continually pushed back to a remoter antiquity.

All literature which is of any value is of course invention; but the fashioning of new literary forms and genres involves a special sort of invention which bears somewhat the same relation to the creative process that invention in the industrial arts bears to the economic arts. But there is a greater inertia in the literary process; there is not the same pressure which capital accumulation and economic competition exert upon technological invention; nor is there the same rate of obsolescence which technical advance forces upon industrialists. But the sharpest difference lies in the fact that every literary form becomes a vested interest. The pressure of the tried pattern tends to deflect the craftsmanship of each writer from the search for new forms to the extraction of all the implications that the existing ones hold. The operative considerations are aesthetic rather than utilitarian, and the continuous need for effecting functional readjustments to a developing, larger situation is not as apparent in literature as in

economics. In fact aesthetic and sentimental considerations often induce a reversion to archaic forms.

But while such a functional adjustment is not apparent in the immediate sequence of experimental changes in literature, it would be dangerous to conclude that it was not operative in the larger areas of change. In fact the great importance of the study of the genre in literary history lies in the relation which it bears to the cultural compulsions of the period. These compulsions do not operate unwaveringly and equally on individual writers: there is the obvious fact that every period shows so great a divergence of literary expression that there is often a greater affinity between two writers of different periods than between two of the same period. To that extent there is an element of significance in Lytton Strachey's remark that Pindar could have written under the Georges and Keats on the eve of Marathon. And in any period the process of literary experiment consists obviously of numberless innovations varying from tentatives toward a slightly changed form to heroic attempts at transforming an entire genre—each of these experiments responding to complex personal and often erratic motivations. The effect of the social forces of the period in determining the literary form is not a direct and unilinear one; it is selective. From the array of potential variations certain ones are over a period of time selected for survival. And the criteria of selection lie in the changing experience of the time. Changes in social structure and in ideological currents bring new experience, and this experience refuses to be crowded into the old forms. They are no longer adequate to express it. And the new literary forms that emerge out of the survival and persistence of certain experimental changes and the lapsing of others may be said to be functionally related to the new experience.

For example, the intensification of cleavages between social classes which tends to accompany a period of urbanization may result in the emergence of new forms or the reemergence of forms long neglected. The social realignments and tensions of seventh and sixth century Greece, which shattered the older tribal homogeneity, resulted in on the one hand a new and flexible type of personalized lyrical poetry, represented by Anacreon, Sappho and Alcaeus, and on the other the naturalistic satiric poems of Archilochus and Simonides of Amorgos. The further growth of the city-states stimulated the devel-

opment of two new literary forms, the choral odes and the dramatic poetry, both related to the activities of the city-state and to the social activities. The growing importance of urban life in the modern period, typified most strikingly in the activities of the Spanish towns, found its reflection in the picaresque novels portraying the urban sharpers who awaited their guileless victims from the country. The popularity of this genre in its French and English forms created a demand among the growing urban middle classes of these countries for a more wholesome use of the prose narrative technique. Thus the rise of the homely novel of sentiment and chastity, which became the hallmark of subsequent bourgeois culture, is best considered against the accompanying economic transformation rather than as a revival of the abstract novel form, which may be traced to the Hellenistic romances, or by the more archaeologically minded to Egyptian prototypes.

So closely is the literary form tied to the culture out of which it has grown that when another culture attempts to take it over there is a tendency toward a transfer of the ideological patterns of the older culture. Vergil, in an age which stood heir to the concepts generated in the long period of intellectual quest and spiritual restlessness that had intervened since Homer, attempted nevertheless to think of his hero and his problems after the patterns and in the atmosphere of the Homeric heroes. The mediæval fame of Vergil in its turn deflected Dante's portrayal of the Middle Ages; although drawing upon the ethos of its own age the *Divina commedia* strikingly reflected, often unconsciously, the pre-Christian world. Tasso was led by his love for older models to stray from the narrow path of sixteenth century Catholicism, and the Puritan hatred of Satan was curiously transformed in Milton. The unsuccessful attempts of Chapelain, Molière and the literary intimates of Richelieu to forge an epic worthy of the great heroes of France, and the loss of the epic may be the result of the transfer of the ideological pattern of a form which thrived in the soil of its own culture. The epic, the romance, which had been cultivated in another pattern of the pre-Christian world, and when placed in a Protestant setting, as is indicated by the reference made to Dr. Johnson's remark on the immaturity of Milton's familiarity with God.

If the forms and genres of literature respond to the social compulsions of a period, the responsiveness of themes is even more striking.

There are of course permanent human themes that run through the literatures of all cultures, but in each cultural situation the basic theme is clothed in a new form. This may be illustrated by the varied treatment accorded the theme of love. As Marx recognized, the sexual instinct is universal, but the forms of marriage and courtship vary with the underlying economic relationships. While not a few of the variations in the conception of love—at least as they are reflected in literature—seem adventitious, the relationship is generally clear. Infidelity, the recurring tragic theme of the ballad stage of society, becomes the spice of Restoration comedy. The love of the flesh, sublimated by the scholastic poets of the Middle Ages into love of God, remained to haunt the less unified generation of Petrarch and to delight the lusty burghers immortalized by Boccaccio. The mistress worshiped at a distance by the platonic troubadour in the last stages of feudal society was displaced by the insatiable Wife of Bath.

But the outburst in the fourteenth and fifteenth centuries of antifeudal satires and fabliaux which attempted to reveal the true character of woman in all its designing ramifications could not permanently supplant the tendency to sentimentalize the weaker sex. When the descendants of the insurgent burghers of those centuries became in their turn the intrenched middle class of the eighteenth and nineteenth, the genteel tradition of chivalry and sentimental love received a new impetus. It is significant, however, as a reflection of changing class ideals that the sentimental literature of the later period was intensely preoccupied with the institution of marriage and with the economic advantages of a successful marriage. Among certain of the romantic poets there is revealed a tendency to regard the woman as an intellectual equal, and with the growing social and economic emancipation of woman the modern novel is stressing the desirability of sexual as well as intellectual equality.

One of the crucial facts about a writer is his kit of values. This is recognized in criticism, where writers are characterized and classified in terms of their affiliation with one or another of a group of schools or literary philosophies, such as classicist, romanticist, realist, humanist, naturalist. These philosophies determine what they shall select for treatment and from what viewpoint they shall treat it. They represent the handle by which the writer grasps reality.

But they are not only instruments in the creative process; they are also embodied in the critical method of an age, serving to canalize the creative stream. They arise in response to social change. A comprehensive change in the social structures may call for a reformulation or reorientation of the prevalent conception of life. This is accomplished in a systematic fashion by the philosophers and through an imaginative and emotional projection by the artists and writers. The connections between the two groups may often be distinctly traced, as in the cases of Euripides and Socrates, Lucretius and Epicurus, Boileau and Descartes, the Schlegels and Schelling, Zola and Comte. The direction of influence is generally from the philosopher to the writer, but the influence is not necessarily one-sided; in reality both formulations may be followed back to the same source.

Conceivably any *ism* can constitute such a philosophy for an author. Any issue that has been long wrangled over may attain the dignity of a school and then of a movement, and after being fought for tenaciously may end by organizing literary expression. Actually there have tended to be certain relatively stable points of view that have served this purpose. Whether these points of view are permanent aspects of human thought, as has been claimed for classicism and romanticism, is very doubtful. Such a division of the field normally involves a straining and extension of each term, so that it becomes practically meaningless. But it must be admitted that there are discernible throughout literary history certain poles between which literary expression has oscillated. The power attributed to the gods and the invisible forces guiding human life measures man's estimate of the limitations of his own power. The sense of human power and self-sufficiency shown in the *Iliad* or the eddas, where the gods are symbols of the superhuman courage of the warrior, has never proved lasting. Homer is followed by Hesiod and the Eleusinian mysteries, *Beowulf* and the *Battle of Maldon* by *Sir Gawayne and the Green Knight*. The anthropomorphic is engulfed by the animistic, by a folklore of magic and witches and monsters. Instances could be multiplied from the ancient and mediaeval literatures of recurring cycles of humanism and supernaturalism. But even in those literatures the antithesis is oversimplified. And by the time of the Renaissance, in which so many historical traditions and fresh social forces converged and cultural boundaries were broken

down, the idea of polarity is no longer useful. In the heightened confusion each writer had to find or fashion for himself an artistic credo to serve as a center of stability. And if this credo narrowed his imaginative scope or distorted his vision of reality, it was only a hazard that has to be run in every imposition of a more or less formal philosophy upon an artistic process.

But every writer has not one but two philosophies—his more or less conscious artistic credo and, lying deeper than that, his often unconscious vision of life and scheme of values. The first is the rhetoric of his writing; the second its logic. Through the first he is assimilated to some "school" within the craft; the second fixes him in the setting of his larger world—his place in the social structure, his economic position, his orientation toward the vital issues of the day, his responsiveness to the contemporary aspirations and realities. In a writer such as a social *Weltanschauung* is likely to lie not on or near the surface but out of sight, where it is the more deeply embedded and the more difficult to quarry.

This more basic philosophy involves the relation of literature to the totality of society. But society is in this case too inclusive a term to be useful in analysis. It must be split up into elements which fall, to start with, into two main groups—those relating to social organization and those relating to ideology. In the first group may be placed technology, economic activity, the organization of the state, the structure of classes, social relations of dependence and domination, the important institutions and the distribution of power; in the second intellectual temper, emotional tone, ethical and religious conceptions, aesthetic achievements. The Marxist approach subordinates the second group to the first, making of it a superstructure (*Überbau*) which rests on the first as foundation. It is truer to say, if the inquiry is into the forces exerting an active influence on literature, that it is responsive to the whole of society, including not only the social organization but also the ideological structure, of which literature is itself a part. And it is responsive to the whole of society seen not structurally but dynamically, so that at any time it is only the elements that have been projected by change and conflict into the arena of operative forces that need to be considered.

Literature will be thus most responsive to the dynamic of a society in transition. Social

change is going on at all times in all social orders: there is no stationary state. But the sense of it and the compulsions it sets in motion vary in intensity just as change itself varies in pace. When the pace becomes sufficiently great so that it no longer represents merely variation within a social system but a sequence looking to its breakdown, the result is a transition society. By its very nature the period of transition has in it elements at once of disintegration and construction. It does not start until something that was a unity begins to break down; it does not end until something new that is a unity has been achieved. Between those termini the sense of wrack or the vision of construction, the stress of conflict, the emergence of order, leave a deep impress on experience. But it is a fevered impress, lacking the strength and firm dignity that arise out of an integrated culture. Routh points out that the *Iliad* shows the marks of having been written in a society that was a unity, the *Odyssey* for a conquered race in a society that had crumbled before the Dorian invasion. Petrarch wrote in an Italy whose Dantean unity—an ideological unity, not political or economic—was breaking up. Shakespeare wrote when Elizabethan unity was in the forging, with the moving vision of the emergence of a new collectivity—English nationality—before him; the metaphysical poets, descending the arc, wrote in the break up of the Elizabethan unity. There is in both the Elizabethans and the metaphysicals the feverish tone of a transition literature; in both a preoccupation with death; but while in the Elizabethans death was the great tragedy, it held for the metaphysicals a strange fascination. In the post-war disintegrative period of modern capitalist society, with the strong focusing of its contradictions, has come again an interest in death, represented strikingly by Thomas Mann and Robinson Jeffers; the one looking upon it as the soil out of which art and beauty spring, the other looking upon it as the final breaking through to reality—the only escape from the body of this life.

In the entire complex of forces making up a society the economic organization, and especially the class structure, have quite generally, under Marxian influence, been singled out as determining the form and the idea patterns of literature. Translating this into terms of a changing society it has been the dynamic of the class structure—the class struggle—that has been thus singled out. The assumption that this has

always affected literature directly is used only by the less critical thinkers of the school; the more considered position is that it attains its effects as a selective process and generally through the mediation of the ideological elements in society. The impact of society on literature lies in the dynamic convergence of both sets of factors—social organization and ideology—each influencing and influenced by the other. The richest body of material that has yet been uncovered for the study of this complex relationship lies in the history of the periods of economic transition in various cultures from the tribal social organization to the feudal, from the feudal to that of petty trade and industry and from that to capitalism. In the history of the capitalist social system the significant relationship is that between capitalistic enterprise, individualist thought and the romantic strain in literature. The present period, which is considered by Marxians to be a transition period representing the disintegration of capitalism, is being widely analyzed from this general point of view.

The processes by which literature has responded to the operative social forces are the ordinary processes associated with the life of institutions. Innovations and tradition, insurgency and the vesting of interests, cultural borrowing and native growth, the carry over of intellectual patterns, the compulsive power of myth—these processes, found throughout the cultural fabric, have also left their mark on literature, adding their purposes and rationale to its own. But literature is also an active instrument: through its evocative power it molds behavior, carries over the propaganda, conscious or unconscious, of its intellectual setting, plays its part in building and breaking social movements and creates beauty values to invest an old order or sanction a new.

The withdrawal of Gautier and the Parnassians from the daily preoccupations of men indicates the first serious disintegration of an age old convention regarding the position of the author in the social group. When language was first being forged through a process of isolating tonal and sound symbols for emotional experience, the creator of new words and new verbal rhythms experimented in the presence of his fellow tribesmen, gauging the success or failure of his experiments by the response of the listeners. Similarly the welding of discrete verbal clusters into sustained conceptual patterns, such

as riddles, charms and proverbs, was an organic development conditioned by the immediate interplay between the collectivity and the verbal-rhythmic craftsman, irrespective of whether he had acquired a specialized status as medicine man or priest or was still an impromptu entertainer and exhorter. In such a literature anonymity was the prevailing convention, since the emotional or religious value of the words rested upon their authority as expressions of the collectivity rather than as the personal creations of an individual.

Between this crude, more or less spontaneous literature, concerned primarily with the bewilderment of primitive man in the presence of the mysterious and hostile forces of nature, and the fully matured self-confidence of the anthropocentric epic lies a nebulous period of tribal development. At the end of the transformation emerged the clearly individualized figure of the tribal chieftain, around whose person revolved the major currents of tribal activity, political, military and cultural. Increasingly aware of his distinctive position in the tribe, he found a useful agent in the person of the literary craftsman, who had likewise come to occupy a more specialized status in the group.

Although it is no longer believed that the Homeric cycle was transmitted orally from one generation of bards to the next, the actual rendition in the court of the chieftain took the form of a recital accompanied by music and usually interspersed with formal, rhythmic dancing. At such a stage of literary development there was no clearly drawn distinction between the creative craftsman and the reciter who might graft on to an inherited body of literature a few embellishments of his own. Through such interpolations the Sanskrit epic cycle grew in the process of transmission to even larger proportions than did the original nucleus of the *Iliad* or *Odyssey*. The concepts of originality and plagiarism were the offspring of a much later, individualistic age. Even in mediaeval Europe the distinction which has sometimes been drawn between the troubadour who created the poem and the jongleur who publicly recited it is somewhat of an abstraction, since the troubadour was often forced by exigencies of fortune to publicize his wares in person, while, on the other hand, the jongleur often introduced into his recitation a not inconsiderable amount of his own handiwork.

The essentials of the relationship between the heroic chieftain eager for personal or family

glory and the craftsman who could clothe these yearnings in a beguiling rhythm of sounds and emotions are discernible in the varied disguises which this relationship took throughout antiquity and the mediaeval period. The element of direct, personal contact may be illustrated not only by the Homeric bards but by the recitations of the Sanskrit *sūta*, the Anglo-Saxon *scop*, the Scandinavian *scald*, the Icelandic *sagamann* and the Celtic *file*. In each of these settings the economic and social position of the bard was intricately bound up with that of the tribal chieftain. It is no coincidence that in Anglo-Saxon poetry the epithet for king is "gold giver," or that the thematic rhythm of many of the early heroic poems was dictated in no small part by considerations of how best to stimulate the tribal chieftain to a pitch of magnanimity wherein he would part with a maximum of gold bracelets and gold rings.

The regime of the tribal chieftain may give way, as it did in Egypt, Babylonia, India and China, to a centralized imperial bureaucracy; or, as it did in Greece, to a group of urban autarchies, at first tyrannic and later democratic. In the former case the literary craftsman becomes a rather indistinguishable element of the public cultural institutions, being assimilated either into the entourage of the court, as in China, or into the religious and commercial oligarchy of Babylonia and Assyria or into the priestly and scholarly circles of Egypt. The more individualistic role of the poet in seventh and sixth century Greece is a reflection in a different sense of the disintegration of the older tribal values of heroism and self-sufficiency. In a period of spiritual disillusionment, growing class antagonisms and political insecurity the literary craftsman was called upon to soothe the minds of troubled tyrants. The bibulous, aphrodisiac lyrics strummed out by Anacreon of Teos at the banquets of Polycrates, tyrant of Samos, are an example of escapism, comparable to the songs of Alcaeus and Sappho in strife ridden Mytilene. When toward the end of this long period of transition between the Achaean and Athenian civilizations the constitutional oligarchs were replacing the tyrants, Pindar served the aristocratic cause more intelligently by bringing the beauties of poetry from the banquet hall to athletic celebrations and civic ceremonies less remote from the restless populace.

The popularization of the Pindaric ode and the transformation of the rural dithyramb into

the drama paved the way for a literary form still better adapted to the amusement and edification of the democratic citizenry of Athens. Under Pericles the role of the literary craftsman underwent a significant modification. The outstanding dramatists, regarding themselves primarily as public spirited citizens, whether on the battlefield, on diplomatic mission or in the theater, preferred civic acclaim, as expressed in the decisions of the popularly elected judges, to pecuniary reward. Since the dramatic medium had introduced a new element of expense, namely, the training of the chorus and actors and the scenic staging of the play, the wealthier classes assumed this indirect form of patronage, while the citizenry itself sometimes contributed sums of money to the writers. Even after the collapse of the proud spirited collectivity in the early fourth century, there is only scattered evidence of a return to the systems of patronage characterizing the ages of Homer and the tyrants. The later Hellenistic empire, reaching its highest level in the Alexandrian culture, is comparable rather to the early bureaucratic type of state; in both the literary craftsman is essentially a public functionary, who, like Callimachus, may combine his delicate, amorous verse making with graver responsibilities as supervisor of the museum. There may be found, however, one practise reminiscent of earlier systems of patronage—namely, the encouragement offered by new centers of culture such as Ephesus and Pergamum to literary craftsmen who were publicizing the legends of the locality.

The infiltration of Hellenistic culture into Rome may be attributed primarily to the material encouragement given by Roman aristocrats of the type of Scipio Africanus to the early exponents of Greek literature, such as Livius Andronicus and Ennius. The utilitarian values of a highly developed literature as a training school for the Forum and as a source of distinctive class culture insured adequate support to the early teachers and practitioners of literature; and despite the violent opposition of the less privileged classes in Rome and the rural aristocracy Greek literature had by the time of Cicero become firmly established. A native literature was still, however, to be forged. With the school of Roman poets which flourished under Augustus the relationship of the literary craftsman to the ruler enters upon a new phase. While Augustus may be said to have been like the more primitive chieftain in his desire for glory or like some of the Greek tyrants in seek-

ing to divert the populace from brooding on lost liberties, his delegation of the literary dictatorship to a person of the type of Maecenas was an innovation. It created a closely knit literary circle, conscious of a homogeneity of mutually stimulating aesthetic ideals which enabled the writers to overlook rather easily the more workaday realities of the patron-client relationship. The active critical judgment of Maecenas, like that of Pope Leo x in Renaissance Rome or of Lorenzo de' Medici in Florence, was a determining influence on the work of the literary craftsman in quite a different sense from that exerted by the Anglo-Saxon chieftains assembled in the beer hall or of the Dorian and Ionian tyrants reclining at their banquets. With the passing of Maecenas and the Augustan literary circle and the rise of a parvenu class of rentiers and *fermiers*, eager to vest itself with the paraphernalia of literary culture, the more disagreeable features of the patron-client relationship became increasingly evident. The gibes of Martial and Juvenal at the poetasters who glutted the client market and at the insensitive, calculating patrons who hoped to buy at not too great outlay the immortality promised by poets are prophetic of a later age.

The main features of the evolution of Roman patronage are repeated in Renaissance Italy and early seventeenth century France. The desire of the fainéant nobility for immortality brought an increasing number of writers to the aristocratic and papal courts to haggle over the price of a literary commission. Despite their fulsome dedications the Elizabethans managed to escape this menial attitude, thanks in large part to the fact that many of the leading writers enjoyed a source of revenue from the booming theaters but also to the more intelligent interest of the English commercial nobility, which in addition to lending the prestige of its name often, as in the case of Spenser, secured congenial sinecures for the more promising poets. The easy familiarity characterizing the relation between writers and patrons in the neo-Augustan age of Dryden and Pope and the mutually stimulating contacts of the literary circle and the political aristocracy were paralleled not only in the group around Maecenas but also the French literary group dominated by Boileau and accorded for a time official state support by Colbert. But with the rise to power of the "barons of the bags" under Walpole and among the bankers of Paris, the atmosphere of sincere and

intelligent appreciation characterizing these literary circles was lost. The thunderings of Johnson in England and d'Alembert in France against the abuses of patronage mark the end of a literary institution which was being undermined by deeper economic currents than either assailant suspected.

Hitherto the literary craftsman had exercised an unmistakable function in the social process; he was an integral unit in the life of the leisure class, most at home in the highest political and intellectual circles. He had dramatized Socratic individualism; rationalized the Caesarism of Julius and Augustus; fired the spirits of the legions of William the Conqueror at Hastings; associated on terms of the closest intimacy with the sons of Frederick Barbarossa; followed the troubadour king, Richard Coeur de Lion, to the crusades; adorned the metaphysics of Thomas Aquinas; filled the Florentine populace with an unreasoning enthusiasm for Lorenzo de' Medici and the restless masses of London with love for the Virgin Queen. In the Sicilian court of the most idealistic and cultured of the Holy Roman emperors he had led the life of a highly prized bureaucrat, whose function it was to perfect new literary forms, such as the sonnet, more adapted to the rhythms of the popular tongue of modern man; at the courts of Marie de Champagne and Eleanor of Poitou he had sentimentalized a disintegrating feudal order and in an age of domineering women and crusading husbands evolved a ritual of love which elevated the lady of the manor to the level which befitted her; in the Wartburg castle of Count Hermann of Thuringia, the most illustrious and intelligent of the German mediaeval patrons, he had fired the spirit of Germanic chivalry.

During all this earlier period the literary craftsman proper, like the leisure class of which he was an integral part, was not deeply involved in the emotional life of the productive masses. To be sure, theatrical art, being by its nature more popular, had directed its appeal to a wider group. But genuine theatrical activity had been confined to a few periods—either periods of democratic enthusiasm, as at Athens, or of an incipient, untutored culture, as in early Rome; or periods marking the emergence of an unlettered class, such as the guild burghers of fourteenth and fifteenth century France. The non-theatrical craftsman, with a few negligible exceptions, such as the popular feuilletonists in Alexandria or the minstrels of the populace in India or the *Spielmann* in mediaeval Ger-

many, was the product and mouthpiece of a leisure class, which filled its earthly span with religion, warfare, politics, learning and love. The crumbs of literature which fell from its table to the productive masses went unnoticed.

By the time of Dr. Johnson and d'Alembert the older economic relationships had undergone a deep transformation: the full effects of the commercial revolution were already felt, and before their deaths the industrial revolution was gradually beginning to gain momentum. The happy experience of Addison and Steele with the *Spectator* and the *Tatler* and of Edward Cave with the *Gentleman's Magazine* had proved to the satisfaction of even the most skeptical eighteenth century book publishers that there was a reading public eager for congenial literature. Under the stimulus of the popular revivalist movements, such as Wesleyanism, and of the insistence of democratic utilitarianism on popular education, a progressively larger section of the productive masses was drawn into the literary process. At the same time the dominant groups within the new nation states became involved in an increasingly complex economic system, which computed its values in terms of price.

The effect of these basic economic forces on the literary craftsman was twofold. The dominant social groups, absorbed in their daily responsibilities in the system of entrepreneurship, found little place in their immediate circle for the man of letters. Deprived thus of his vital contacts with the dynamic elements in the social process no less than of his leisure status, he turned either in a spirit of resignation to the fainéant remnants of a precapitalistic age or, if of a more realistic temperament, set out to orient himself more accurately in terms of the various levels represented by the enlarged reading public.

Although he had assumed a professional status on the periphery of the price system the author's sense of immediate contact with the other members of his profession decreased. The small literary circle of Augustan poets and critics was a self-contained, exclusive unit. Critical standards, based on intricate rules of composition and presupposing an intimate familiarity with the rather inaccessible texts of earlier masterpieces, closed the gates in the face of the overpresumptuous. The Horatian idealization of the poet as a civilizer, a being apart, akin to Cadmus, was perpetuated throughout the Renaissance and served even later to discourage

the vulgar interloper. With the gradual release of individualism accompanying the break up of feudalism the task of the critical oligarchs became increasingly difficult, as can be gauged by the vehemence of Boileau and Dryden and Pope against the fumbling hangers on in the republic of letters. With each new stage in the spread of individualism the impossibility of the task became more manifest. The declining appeal of ecclesiastical and military careerism sent a growing number of recruits into literature, ill adjusted to their social system but unfitted also for their new profession. At the same time the implications of the newly proclaimed doctrine of the "career open to talents" were drawn by an ever mounting number of ambitious and penniless youths. With no organic group center around which to cluster writers followed the general drift to the cities, where they broke up into artificial groups bound together by the miseries of Grub Street or at a later date by the Bohemian atmosphere of the Parnasse cénacles.

The proliferation of literary and intellectual groups was accompanied by an unprecedented demand for printed edification and amusement. The older public ceremonies which hitherto had beguiled and as a rule edified the populace—religious rituals on the Acropolis and at Chartres, gladiatorial contests and circuses, festas and endless saints' days, mimes and miracle plays, tournaments and bear fights—were fast giving way to the industrious drabness of Manchester. While the middle class turned in ever increasing numbers to the mirror of literature in search of an idealized reflection of its virtues and ambitions, those in the smoky tenements sought in literature only a brief opiate from the day's drudgery. The majority of modern writers, like the majority of modern readers, have been drawn from the contented middle class. Through the medium of the novel author and reader, turning from kings and nobles, have peered into the everyday lives of their neighbors, gazed upon the pleasant face of nature, shared their ideals of love and earthly fame, discussed their problems of love and marriage. The success of the early novelists, notably Richardson and Jane Austen, soon established a mold which has required but little modification in its adaptation to the demands of large scale literary production. To the more determined of the standardized profession of letters have been accorded wealth and veneration, and to the less talented at least their daily bread.

The escape from this prevailing preoccupation with homely matters has been furnished by the literature of adventure and illicit romance, which lightens the drudgery looming in the shadow of Manchesterism. The children of those toilers who at an earlier stage found diversion and comfort in the exploits of Jacob and Gideon turned to the new supplies of adventure distilled from the lusts and crimes of an industrialized society or the lawless adventure of a frontier in process of exploitation. Reynold's penny romances of the 1830's, the paper covered volumes of Nick Carter and Jesse James, the pulp magazines of the subway age, have brought flashes of release to the millions who have preferred to forget their own lives.

Like the submerged group of readers, a small literary layer much nearer the apex of the social pyramid has sought escape in a variety of ways from middle class standardization. Shelley, Matthew Arnold, Flaubert, Ibsen, Shaw, the latest group of formalists—all these and many more have reviled the standards of Philistinism and of Philistine literature. The romantics sought escape in a neo-Prometheanism or mediaevalism or pantheism or revolutionary oratory; the Parnassians sought it in the religious literature of India and Persia and early Greece; the de Goncourts and their maladjusted French and English followers in the literature and art of the Orient; the symbolists in the nebulous melopoeia of delicate, half formed images; the formalists in the ferreting out of new verbal masses and rhythmical patterns; the transitionists by blasting the word itself.

This upper group has in the nature of things been the most articulate in rationalizing its pretensions and predilections. The modern conception of literature may be said to be in large part its handiwork. It has been openly suspicious of literary mass production and amused by the lower reaches of literary output. Against the modern traffic in books it has sought to set up standards based on literary tradition or aesthetic rationalism. Unconvinced by the utilitarian argument from numbers, it denies that "pushpin is as good as poetry" and measures its audience in terms of centuries rather than publisher's sales. The attempt of this self-conscious group to leaven the inert mass of functional readers by familiarizing them with laws of taste of a less ad hoc nature has not materialized. The dogmatic assurance of "Augustan" criticism, buttressed by the prestige of

a functioning social group, finds in the modern period a few nostalgic exponents, but ex cathedra judgments, even of a Brunetière or an Eliot, have only a limited carrying power. For among the inalienable natural rights of the modern individual is that of knowing what he likes. The attempt of the impressionist critics to tell him why he likes it or why he should like something else more seemed for a time, in the hands of an Addison or a Hazlitt, to give promise of elevating the public taste. But the unpretentious, conversational tone of the impressionist critic soon came itself to be commercialized and vulgarized. The growing lists of the publishers on the one hand and the growing numbers of those who want to write on the other have resulted in the tremendous expansion of the group of literary intermediaries known as book reviewers. Ranging from esoteric literary reviews to boiler plate columns and to rural weeklies, the realm of criticism has come to display as violent cleavages as are found in the reading public and among the authors who try to anticipate its tastes. In an age of blurbs, literary teas, book clubs and Christmas trade publicity the critic's impressions of the adventures of his soul among masterpieces tend to gather irrelevant values; while the lamentations of the minority which still persists in thinking of the intrinsic values of literature grow proportionately fainter.

The dual problem of sociological criticism—the social conditioning of literary creation and the impact of literature on society—has received varying emphasis and neglect in the long history of critical exploration. Greek criticism was cut off from any real consideration of the creative process, either in social or psychological terms, by reason of its contempt for any non-Greek variant and its tendency to take its own body of literature for granted. When Aristotle formulated his doctrine of mimesis, or the imitation of nature, the Greek masterpieces were already in existence. The rules of literary composition, set forth in the *Poetics* and the *Rhetoric* and repeated with minor variations by the long succession of Aristotelian critics, were at the outset arrived at in large part by an inductive process of analyzing existing models. But once arrived at they were universalized, and in the hands of an intelligent literary craftsman these axioms of composition were deemed adequate to convert the world of nature into the realm of art. The intricacies

and problems of the intermediate personal process were minimized and glossed over. The major energies were directed to a classification of types of literature and the differentiation between faults and merits in composition. The tendency to ignore the processes of personal creativeness was emphasized by the fact that Greek literature was collective in inspiration and traditional in form, and that since his material lay in the tribal tradition the poet was merely the craftsman molding it into literary form by well attested rules.

The influence of the Aristotelian approach lay over western critical thought for two thousand years. Some of the later Hellenistic aestheticians, notably Longinus and the neo-Platonists, stressed imagination in the creative process and revolted against the sovereignty of overformal rules. But although its importance was revived by modern thought, the movement was at best a minor insurgency. In Rome, where the task of the critic was bound up with the profession of the teachers of rhetoric, the rules of composition became increasingly meticulous. But they were oriented primarily toward preparation for the public career. In the hands of a critic who was himself a literary craftsman, like Horace, the rules were fashioned into an *ars poetica* in which the factor of *ingenium* was taken for granted and forthwith dismissed. Neither in Horace nor in the numerous Horatians of Renaissance Italy and seventeenth century France was there any sustained interest in any portion of the literary process except the end product. The new interpretation given to the Aristotelian mimesis by certain Renaissance critics, such as Vossius, according to which the masterpieces of antiquity took the place of nature as the proper object of imitation, left even less reason for concern with the complexities of the creative process. The Atheno-Roman logic of *barbaroi*, reinforced by the thrill of the classical revival and the consciousness of succession to the ancient tradition, enabled the sixteenth century Italian critic to generalize and prescribe with the assurance of old. This critical absolutism persisted even into seventeenth century France, which conscious of its intellectual hegemony in Europe was persuaded that the mantle of Rome had settled with providential fitness on its shoulders. The deeper lying drives, the cultural and intellectual forces at once stimulating and conditioning the task of writing, remained outside the realm of exploration.

But the second aspect of sociological criti-

cism—the impact of literature on society—was given rather extended attention. Plato wished to banish poetry utterly from the Republic because it could be intoxicating to its victims and interfere with the more serious pursuits of life. And without sharing Plato's passionate outburst against the poet the classical world agreed that literature had a marked social incidence. The poet was *morum doctor*, and the orthodox version of his social function is expressed in Horace's *delectando pariterque monendo*. The Achaean heroic type presented in Homer, combined with the more mature wisdom characterizing the gnomic poems of the Seven Sages, the odes of Pindar and the dramas of Sophocles, presented undoubtedly a pattern of self-reliance and moral restraint that may have been found useful to the stability of the Greek politics in periods of transition and disintegration; the hold that Euripides had on the imagination of the Hellenic world served something of the same function in the direction of political amity as Shakespeare is said to have served among English speaking countries; and the tory diatribes of Aristophanes against the individualism of Euripides as an important factor in the disintegration of the older tribalism are evidence of how the Greek mind was occupied with the social impact of literature. In other cultures similar instances may be cited—the attempt made in the *Bhagavadgita* to bolster the Indian caste system by propaganda stressing its justice and sanctity and directed to the farmer, the soldier, the shopkeeper; and Vergil's idealization of a farmer's life in a period of chaotic agrarian unsettlement as well as his intent to fashion a glorious heritage for an empire freshly welded out of dynastic struggle. The common element in most of these cases is the consciousness of the effectiveness of literature as a force making for order or revolt in a changing social organization or political system.

With the victory of Christianity a rigid moral and political instrumentalism—implicit, when it was not a conscious policy, in the new religious philosophy of life, and reacting against the decadence of Greco-Roman life in the empire—destroyed pagan literature where it could and placed its imprimatur only on what was edifying and expedient. The instrumentalism of an *ecclesia militans* was followed in due course by a diluted but oppressive moralism, finding its strongest expression in sixteenth century Catholicism and insurgent English Puritanism, which represented the extremes of moral revival

in the interests of religio-political struggle. And the endless harping on the moral beneficence of literature that is found in late Renaissance Italian criticism, along with the patient defense of literature by Sidney and the Elizabethan critics and by Congreve a century later, may be interpreted as a response to this pressure.

It is in eighteenth century critical thought that a distinct conception of the social conditioning of the literary process first emerges. The confluence of several appreciable forces, all working in the same direction, may serve as an explanation: the early environmentalism of the Renaissance and seventeenth century thinkers; the emergence of centralized nation states, building, and building upon, a feeling of nationality; the spread of literacy and literary effort; the growth of a middle class, emotionally bound to a native tongue and a native culture and skeptical of the fervor of the classical revival as embodying an aristocratic snobbishness. All these forces combined to produce a movement of literary criticism which threw its major emphasis on the organic unity of the national literature with the national culture. Wotton and Hume in England, Dubos and Condillac in France, Kant, Hamann and Herder in Germany, may be selected as exemplifying the variety of approaches to the problem. The movement took at first the form of a debate as to the relative merits of the "ancients" and the "moderns," and later the mediaevalist strain, represented in England by the writings of Hurd and the Wartons and in Germany by Gottsched's and Herder's continuation of an older mediaevalist strain, harked back to the glories of the national literary past. But neither the bitterness of the Battle of the Books nor the pressure to bolster the national pride against the Gallic pretensions to cultural hegemony is of primary significance: the chief importance of both lies in the fact that they suggested the outlines of a critical method which related the body of literature—of both a nation and a period—to the conditioning geographical, racial and political factors. From this followed the position, adumbrated in the Elizabethan period by Daniel's *Defence of Rhyme*, and given characteristic expression in Warburton's answer to Shaftesbury's criticism of Hebrew poetry: no literature, insisted Warburton, could be judged except as the critic placed himself in the position of the audience for which it was intended. The underlying assumption of this group was that a literature which had evolved organically out of

the matrix of a society held more possibilities of greatness for that society than did an alien importation.

This early insurgent environmentalism was developed more scientifically in the nineteenth century and became the prevailing conception of literature. It was used to good effect by the romanticists in their struggle to displace the classicist position. Chateaubriand's mediaevalism had had considerable contemporary influence; and Madame de Staël, who was conversant through Friedrich Schlegel with Herder's literary nationalism, published studies of the German temperament and literature in her *De la littérature considérée dans ses rapports avec les institutions sociales* (1800) and her *De l'Allemagne* (1813), which were received with acclaim and were widely imitated. Along with the even more brilliant outpourings of the creative romanticist poets and dramatists, they marked the overthrow of the long entrenched classical absolutism. Rousseau's dictum that the only absolute truth was that there was no absolute truth had by 1830 been transmuted into a generally accepted axiom. Romanticists such as Wordsworth and Hugo developed a critical interest in the creative process of the individual writer, for the study of which a path had been blazed by the sensationalist psychology of Locke, by the emphasis placed by Shaftesbury on the dynamic and emotional elements in the literary creative mind, by the speculations of Home in England and Baumgarten in Germany on the nature of the creative process—developed more systematically in Herder's analysis of *Idiotismus*—and by the vogue of individualism and sensibility ushered in by Sterne and Richardson. This interest, taking the form of the cult of the genius and emphasized to the exclusion of all other factors, combined eventually with the complete formalism of the "art for art" school. The environmentalist position, on the other hand, building on Darwinism and Comtism and on the sharpening of scientific method, was extended to a more precise analysis of the social forces conditioning literary creation. Its most characteristic expression is found in the famous trilogy of Taine, in which he classified the environmental influences under *race*, *milieu* and *moment*. Brunetière displays even more markedly the tendency of this later type of environmentalism to eventuate in a reassertion of superpersonal standards.

The emphasis of the scientific critics on broad environmental determinants and the preoccu-

pation of the more introspective of the romantic poets with the individual creative mind were accompanied by a third approach to the literary process. Although thoroughly conversant with the environmentalist position the democratic humanitarians and socialist utopians of 1830, reacting against the *laissez faire* indifference of the Benthamites, emphasized the role of literature in the task of fostering the spiritual and emotional welfare of the unprivileged masses. The sentimental humanitarianism which had begun in the eighteenth century and received a stimulus from the writings of a number of the romantic poets, as, for example, Shelley and the early Wordsworth, deeply colored the conception of literature voiced by Saint-Simon, Proudhon, Fourier and Comte in France, Kingsley and Ruskin in England and Bielinsky and Chernshevsky in Russia. This emphasis on the social role of the literary artist is essentially a perpetuation of the older classical and Renaissance attitude adapted to the social problems of an industrialized society.

In reaction against this exclusive concern with the civic functions of literature a group of younger writers headed by Gautier set out to shift the emphasis back to what it regarded as the essentials of literature. The various forms assumed by the art for art movement among the successors of Gautier, especially in France and England, sought to focus attention on the peculiar problems distinguishing the work of the literary craftsman from that of all other types of thinkers and writers. This led both to the cult of the genius and to formalism, which devoted itself exclusively to problems of literary technique. In both cases the pretensions of the scientific environmentalists to explain away literary masterpieces were repudiated. This anti-environmentalism has varied from the annoyance of Whistler to the reasoned skepticism of Pater and to Croce's emphasis on intuitive phantasy as the only genuine factor in the creative process.

Until recently these varying conceptions of literatures, which may be traced from Plato to Cocteau, have proceeded on the whole undisturbed by authoritarian intrusion. The victory of the Bolsheviks over the White armies in 1920 and the subsequent consolidation of the U.S.S.R. have brought the question of literature out of the realm of theoretical abstraction and converted intellectual polemics into revolutionary partisan warfare. As an insurgent movement Marxism directed its major efforts

to the overthrow of bourgeois society according to the scientific system laid down by Marx and elaborated by Engels. The necessity of propagating the cardinal doctrine of the class struggle had directed attention to the potentialities of the written word as a revolutionary weapon, but the question of the origins and function of literature in its higher ranges was not a pressing one. Dialectical materialism in laying out systematically the materialistic foundations of the ideological superstructure developed the environmentalist position with marked precision; but Marx himself did not attempt to apply its methodology overrigidly to the masterpieces of literature. A devoted reader of Aeschylus and Shakespeare, he also found relaxation in contemporary bourgeois literature, especially in the works of Balzac, which he intended to criticize at his first leisure. He felt no hesitancy in emphasizing, in the appendix to *The Critique of Political Economy*, that "certain periods of highest development of art stand in no direct connection with the general development of society, nor with the material basis and skeleton structure of its organization." Later Marxian scholars, of the type of Labriola and Plekhanov, have also been inclined on the whole to emphasize that the dependence of literature and the arts on the underlying modes of production is less directly traceable than is the case with political and legal ideologies and institutions. Since even to the present day no systematic attempt has been made to subject the workings of the creative process itself to the methodology of dialectical materialism, the Marxian interpretation of literature has laid itself open to the same charge that Saint-Beuve brought against Taine's environmentalism—namely, that it tended to ignore the technical and psychological elements distinguishing the literary craftsman.

The October thrust to power basically altered the emphasis of Marxism; unlike Engels or Liebknecht, Lenin was confronted with the task of organizing a proletarian culture. Between the present and the ultimate goal of a classless society was to be a period of transition of indeterminable length. Unlike Trotzky, Lenin refused to conceive of this period as essentially a brief and uncultured interlude of blood and sweat. The deterministic implications of Marxism insured that the struggles of the immediate future would inevitably reflect themselves in a new culture, while the dialectical elements indicated that the fostering of culture, especially in the realm of the written word, would

forward the consolidation of proletarian power. In such a program the role of bourgeois literature became a consideration of state.

Although Lenin, like Marx, felt no hesitation in expressing his fondness for the bourgeois masterpieces of the past and even his preference for Pushkin over the revolutionary poet Maikovsky, the activities of the various heterodox literary groups carried over from the aesthetic circles of the late empire continued to bring to the fore the question of bourgeois literature. In the early period of military defense and consolidation little attention was paid to the "decadent bourgeois" groups which assembled in the cafés to discuss the ramifications of imagism and formalism. The attitude of patronizing tolerance toward them which persisted even after the cessation of civil war is typified in Trotsky's lecture to the formalists, wherein he attempted to orient their abstract views against the concreteness of dialectical materialism. Most of these schools, like so many of their counterparts in post-symbolistic bourgeois societies, were essentially one-man movements and died out naturally with the death of the leader; while in other cases the leaders of the asocial extremists found themselves gradually drawn from the poetic laboratory closer to the factory.

The problem of the bourgeois "fellow travelers" continued, however, to be a storm center. Since it was widely assumed that Marx and Lenin had established the fact that bourgeois literature was a reflection of bourgeois society, it followed that the writings of an ex-bourgeois group constituted a hindrance if not a danger to the carrying out of proletarian ideals and proletarian program. The struggles of such groups as the All Union Association of Proletarian Writers (V.A.P.P.), the *Na Postu* and the aggressive Proletcult of Bogdanov to set up a cultural dictatorship directed to the eradication of subversive bourgeois literature and art, took the form primarily of attacks on the "fellow travelers." In 1924 the government in order to put an end to introverted literary polemics, issued a series of formal resolutions repudiating the pretensions of any group to literary hegemony, laying down the broad principle of free competition of aesthetic ideas and recommending to the proletarian groups that they learn from the better trained bourgeois literary craftsmen the refinements of technique and at the same time inculcate them more zealously with the essentials of proletarian ideology.

The reversal during the 1926 crisis of the

government's earlier position may be attributed to the impolitic behavior of the "fellow travelers" themselves. Convinced, like many engineers and intellectual experts of the period, that the persistence of the NEP was the herald of a return to the old order, the spokesmen of the right wing literary groups were heartened to express in literary forms their newly revived hopes. Confronted with what bore the marks of a major crisis the government retaliated by organic pressure which soon communicated itself through efficiently functioning Soviet channels not only to critical but to mass opinion. Auerbach, personifying the hitherto restrained rancor of the antibourgeois groups, became the literary man of the hour. The bourgeois suspects continued as editors of their literary magazines but unimpeachable proletarians were introduced as assistants. The books of the "fellow travelers" continued to be published, but the universal chorus of disapproval, ranging from critical journals to factory literary circles, drove the authors either to silence or to more unequivocal participation in proletarian programs.

The sense of increasing security, which mounted with the startling success of the Five Year Plan, and the growing indications of a more genuine proletarianization of the bourgeois literary group led on April 23, 1932, to an official resolution liquidating the V.A.P.P. and its affiliated branches which had persisted in their literal minded version of proletarian culture and literature. With the growing sense of well being, there has been manifested recently a general disposition to relax. As the second Five Year Plan draws nearer, there begins to appear even a tendency to suggest the dangers of hyperasceticism and exclusive preoccupation with superpersonal values. At a stage when some of the non-exploitational amenities of bourgeois life—love, romance, flowers, silk—find gracious apologists, the boggy of bourgeois literature is being gradually laid. Stalin like Marx finds relaxation in Shakespeare, whose works he recommends as correctives to the overprolific manufacturers of ill constructed social tracts.

The role of the Russian Revolution in bringing literary theory from the library and seminar to the public forum has extended to most of the larger countries of Europe and America. The proletarian movements have varied in strength, ranging from that of Germany through those of Austria and Hungary to those of the United States, France and England, where the goal of

the dictatorship of the proletariat seems as distant as it must have seemed to Engels. But even where the actual movement is weakest the widespread interest in the Five Year Plan and the growing hold of proletarian ideology on critical and intellectual circles have given a new orientation and note of actuality to the various conceptions of literature. Especially in those countries such as the United States and England where the methodology of historical materialism had not already become part of the climate of opinion, the possibilities of the so-called Marxist interpretation of literature have attracted not a few literary critics and historians.

The problem of the proper attitude for proletarian literary groups in these various countries toward "the fellow traveler" revolutionist writers who seek affiliation with them has been solved on the whole in essentially the same spirit as in Russia itself. The dangers from the ideologies of right wing socialist groups as represented by Kautsky and Vandervelde and of dissenting communist groups, such as Trotsky's, are of course much stronger and have been fully appreciated by the International Union of Revolutionary Writers. The criticisms heaped by the conference at Kharkov in 1930 on Henri Barbusse's journal *Monde* for opening its columns to ideological renegades are sufficient evidence of the unwavering attitude displayed toward any vital manifestation of heterodoxy. But almost as serious as right wing heresy from the point of view of the more intelligent leaders of proletarian literature is left wing sectarianism, which insists on closing the door tight against all would be revolutionary writers of bourgeois or petty bourgeois origins. The necessity of reeducating the revolutionary affiliates and of gradually eliminating false ideology is stressed as one of the primary responsibilities of the genuine proletarian writer groups. Outside of Russia the best organized groups of proletarian writers are to be found in Germany, Austria, Hungary and China, although the nicely balanced attitude displayed toward bourgeois revolutionary writers by the proletarian literary groups of Japan was especially commended at the Kharkov Conference, where plans were laid for extending the influence of the International Union of Revolutionary Writers to the backward colonial areas which were beginning to display increasing signs of a revolutionary activity. Although the United States played a comparatively insignificant part at the conference, the intervening two years of depression have swelled

considerably the ranks of bourgeois writers sympathetic with the proletarian movement. In a number of cases the attitude displayed by members of this group toward the question of bourgeois literature has been more uncompromising than that of the less inexperienced Russian leaders. Moreover, in the ever growing literary skirmishing over the implications of class literature, the tendency to identify Marxianism with economic determinism has produced not a little confusion and disagreement as to the most valid conception of literature.

LITTLETON, SIR THOMAS DE (c. 1407-81), English jurist. Littleton was the son of a distinguished Worcestershire family. Little is known of his early life. In 1450, having already achieved distinction at the bar—he had been escheator and undersheriff of Worcestershire and recorder of Coventry—he became the first reader to the Inner Temple; in 1455 he was appointed king's serjeant. He seems to have taken no part in political struggles and was little disturbed by the changing fortunes of York and Lancaster. From 1466 until his death he was judge of the Court of Common Pleas.

Littleton's reputation rests chiefly upon his treatise on *Tenures*, one of the first books printed in London and the first and perhaps the most famous treatise on English law. This must have been written shortly before the close of his life, for it was published in 1481 or 1482. More than seventy editions appeared before 1628, when Coke published his scarcely less famous *Commentary upon Littleton*, and about twenty subsequently; of Coke's commentary twenty-five editions appeared.

Littleton's *Tenures*, unlike the earlier treatises of Glanville and Bracton, is a purely English work, dealing only with the common law of England. It shows no trace of the influence of civil law codes or writers. It was the first attempt at a scientific classification of land rights and

gives a thorough description of English mediaeval land law before the recognition of equitable rights. The book became not only the foundation of the law of real property in England but also the textbook through which for almost two centuries students received their introduction to the law. Although Littleton refers to some reported cases to illustrate the principles which he lays down he works chiefly by means of typical, hypothetical cases. Exhibiting no ontological or philosophical curiosity, it is a book for lawyers only and as such is a superb performance, simple in style, orderly in arrangement and precise in expression.

LITTRÉ, MAXIMILIEN PAUL ÉMILE (1801-81), French philosopher, scholar and politician. Littré began to prepare for a medical career, then turned to the study of philology and linguistics. Of a deeply ingrained republican persuasion, he participated with the university youth in the revolution of 1830. The problem which his many sided interests presented was finally solved by his entry into political and scientific journalism. His most important productions as a writer were his works on the French language, particularly his *Histoire de la langue française* (2 vols., Paris 1862; new ed. 1863) and *Dictionnaire de la langue française* (4 vols. with supplement, Paris 1863-77). In social thought he is of significance as an organizer rather than as an innovator. About 1840 he entered into association with Auguste Comte and thereafter became Comte's most prolific and perhaps most distinguished French disciple, contributing greatly through his articles in the liberal paper *National* to the exposition and popularization of positivistic ideas. The form of positivism to which Littré adhered was that expounded in Comte's first great work, *Cours de philosophie positive*. After Comte became interested in the propagation of a religion of humanity Littré repudiated him and remained faithful to the original scientific principles of positivistic philosophy, for the dissemination of which he founded the *Revue de la philosophie positive* in 1857. On certain points Littré differed even from Comte's first phase. He accepted Comte's two fundamental laws, that of the three stages and of the evolution of the sci-

ences in the order of decreasing generality. Lacking the profound mathematical training of his master he inclined, however, to view their operation as a biological process which advanced by slow, imperceptible transformations. In the history of civilization he accorded science a more important place than did Comte; but in the history of knowledge, while he embraced Comte's view of science as the final goal of intellectual progress, he believed that scientific problems must be clearly demarcated from those of metaphysics. As a writer on political subjects and as a moralist Littré was even further from Comte. His essential political tenets were liberalism and anticlericalism; and he occupied himself in later life with the highly practical problem of advocating a republican, lay, centralized government in France—the type of regime which the Third Republic was to realize. A rationalist in ethics, he held that the notion of justice, traceable to an innate respect for human equality and susceptible of unimpeachable logical demonstration, is the supreme principle regulating moral relations. The publication of his “*Des origines organiques de la morale*” (published in the *Revue de la philosophie positive*, 1870) and of the *Dictionnaire de médecine* (ed. by Littré and C. Robin, Paris 1855; by Littré alone, 1884) gave rise to charges of materialism. Monseigneur Dupanloup resigned from the French Academy upon Littré's entrance in 1871. In that year Littré was elected deputy from the Seine to the National Assembly, where he sat on the left. Through this position and through his writings he influenced the founders of the policies of the Third Republic, particularly Gambetta and Paul Bert, both of whom accepted positivism. The deep imprint of positivistic ideas, particularly with regard to scientific and ethical instruction, on the educational system inaugurated by the Third Republic and constructed by Bert in collaboration with Ferry and others shows Littré's influence, as the mark of post-Kantian ideas in the system can be traced to Charles Renouvier. No other thinker except Renouvier contributed so energetically as Littré to the shaping of the official philosophy of the Third Republic.

RENÉ HUBERT

Works: Littré's principal books on social subjects include: *Application de la philosophie positive au gouvernement des sociétés* (Paris 1850); *Conservation, révolution, et positivisme* (Paris 1852, 2nd ed. 1879); *Auguste Comte et la philosophie positive* (Paris 1863, 3rd ed. 1877); *La science au point de vue philosophique* (Paris 1873, 5th ed. 1884); *Études sur les barbares et le moyen âge* (Paris 1867, 3rd ed. 1874); *Fragments de philosophie positive*

et de sociologie contemporaine (Paris 1876); *De l'établissement de la Troisième République* (Paris 1880).

LIVERPOOL, FIRST EARL OF, CHARLES JENKINSON (1727-1808), British statesman and monetary theorist. Liverpool's official and political future was determined by the fact that as a young man he became private secretary to Lord Bute. Thus he entered the company of the King's Friends, became an undersecretary of state in 1761, obtained a seat in the Commons and by ability as well as by influence climbed to many important offices, attaining the peerage as Lord Hawkesbury in 1786 and an earldom in 1796. When Bute retired from the Commons, Liverpool succeeded him as leader of the King's Friends. Under North he performed competent work as secretary at war (1778-82). Despite a certain odium in which he was held because of his reputed intimacy with the king he greatly influenced commercial policy under the younger Pitt. His thorough grasp of economic matters, reflected even in the fragmentary speeches of the *Parliamentary History*, made him Pitt's invaluable adviser; and the Irish Propositions, the French Treaty, the trade relations between the British colonies and the United States and Pitt's financial schemes were all in part fashioned by Liverpool's counsel. He was on the committee of the Privy Council which succeeded the old Board of Trade (1784-86) and in 1786 became president of a reconstituted Board of Trade and Plantations. In this office his dominant aim was to safeguard the shipping industry in the belief that despite the loss of the thirteen colonies England's power would be enhanced if she could retain the navigation of the New World. For this reason he opposed the abolition of the slave trade and radical changes in the navigation acts.

Liverpool's greatest contribution, however, was in currency reform. He was the leading advocate of gold monometallism, and it was mainly through his literary and personal efforts that the gold standard, which had already existed in England de facto, was given legislative recognition, first in the acts of 1774 which called for recoinage of gold coins and limitation of the legal tender of silver coins to payments not

exceeding £25 and later in the act of 1798 which prohibited silver coinage; the law of 1816 largely reaffirmed the principles enunciated in preceding legislation. His *Treatise on the Coins of the Realm* (Oxford 1805) presents the most convincing argument for the gold standard; it was republished by the Bank of England (new ed. by G. W. Birch and H. R. Grenfell, London 1880) during the bimetallist controversy of the 1880's.

LIVESTOCK INDUSTRY. Because of their importance to man cattle, sheep and hogs have constituted a vital factor in all civilizations. In antiquity they were an element not only in the food supply but also in artistic and religious activities. Today the American or European husbandman engages in the breeding, feeding and marketing of animals whose forbears were treated as gods or mythological heroes by the peoples of ancient civilizations. Up to recent times the livestock industry was definitely of a primitive nature. It was nomadic and pastoral and any commerce which resulted from it was never on more than an intracommunity basis. Animals were not bred carefully; although they were slaughtered for their meat they were utilized equally for their hides and wool, tallow and bones.

The livestock industry of the modern world is a direct result of the growth of towns, the industrial revolution and the oversea expansion of the late eighteenth and the nineteenth century. These changes in the economic life of the West made necessary the development of additional food resources, and new capital appeared to provide the means for the expansion of the livestock industry on more or less systematic lines in the great new lands of the Americas, Australia, New Zealand and South Africa.

Within these areas in the latter part of the nineteenth century there were a number of in-

fluences at work to speed the process of growth. The pioneer settlers leaving behind them the towns and villages of the seaboard penetrated into the great plains regions to carve out new homes and to engage in commercial agricultural enterprises. Here they found the conditions most suitable for the development of a livestock industry: corn and other grains sufficient to fatten livestock could be grown on the grasslands; in the range country there was ideal pasturage for millions of head of cattle and sheep. The entry of the railroads into the pioneer fringes provided transportation which linked the stock farms or ranches with the markets. The invention of refrigeration made possible the storage of meat supplies at centers after slaughter as well as the year round operation of packing plants; the latter in turn created a continuous market for the producer. The appearance of the modern canning industry permitted the utilization of livestock products in canned foods which could be kept indefinitely without deterioration. With the perfection of an adequate financing mechanism there emerged the large scale livestock industry with which the modern world is familiar. The result of all these factors has been that the peoples of the West, particularly those of the new plains countries and the industrialized nations of western Europe, have become consumers of meat stuffs in large quantities and that consequently beef, veal, mutton, lamb and pork have become significant in international trade.

Cattle. Beef cattle are the bulwark of agriculture. On the ranges and pampas they convert vast quantities of grass and forage into high grade meat, the value of which is greater than that of any other commodity which might be produced from the same raw material. Beef cattle fit admirably into the modern agricultural scheme: they require little care; they are not easily carried off by disease; and their proportionate consumption of cheap roughages and high priced concentrates is admirably suited to the crop rotations of ordinary farms. Besides their manure makes possible the retention and renewal of the richness and mellowness of the soil. Almost one tenth of the gross farm income of the United States comes from the sale of cattle, which at the peak of prosperity in 1929 amounted to about one billion dollars. This was almost as great as the income from hogs and over six times the income from sheep.

The estimated world population of cattle is in the neighborhood of 600,000,000 head, which

is as large as the total for sheep and two and one half times that for hogs. In commercial importance North and South America are the outstanding cattle regions of the world, although Asia, where cattle are comparatively unimportant for world trade, has a cattle population greater than that of North and South America combined. The following are the figures for the principal cattle countries with the year of census or estimate in parentheses: India (1928), 184,555,000; United States (1930), 57,978,000; Asiatic and European Russia (1930), 53,800,000; Argentina (1930), 32,212,000; Germany (1930), 18,033,000; Australia (1929), 11,301,000. Although the cattle of the United States number only one tenth of the world's supply, this country produces more beef than any other nation. This is largely due to the fact that the cattle of the United States are raised almost entirely for their meat; moreover by the use of pure bred sires beef production per unit of breeding stock has been increased to a point reached in but few other countries.

The tendency to greater density of cattle population in certain areas than in others is due to feed and climatic conditions and to the existence of a variety of racial customs regarding the consumption of beef and dairy products. A supply of proper feed is one of the limiting factors having a bearing on the density of cattle population. Thus in Argentina the production of cattle has developed rapidly since 1900, in considerable measure because of the discovery that animals could be stocked easily on the rich natural forage grasses of the country. Young steers are raised on grass until they are two to two and one half years old and are then removed to special alfalfa pastures for a fattening period of six months. Similarly, in the western plains area of the United States pastures have been found especially suitable for the grazing of cattle; while in the American corn belt a relatively dense population has been established as a result of the large supply of grain available for fattening purposes. In fact nearly 30 percent of all the cattle in the United States are to be found in the seven corn belt states of Ohio, Indiana, Illinois, Iowa, Missouri, Nebraska and South Dakota. There are also considerable numbers of beef cattle in the sugar beet and sugar cane regions of the United States, where these feeds have also demonstrated their suitability. While cattle may be found in both cold and hot regions they thrive best in the temperate zones.

In the United States cattle were introduced

into Florida, the lower Mississippi valley and the southwest by the Spanish and into the Atlantic coast section by the English and the Dutch. After considerable expansion in Virginia and the Carolinas cattle production was pushed out by cotton. Since the beginning of the nineteenth century cattle raising has constantly moved toward the west, seeking the areas of cheapest production. The early nineteenth-century agrarian migration started cattle grazing in the Ohio valley, and cattle were driven over the Alleghenies to eastern markets. As corn production increased, this fattening area developed and cattle breeding was centered across the Missouri River. After the Civil War and during the decades of the 1870's and 1880's a scarcity of cattle in the north, due to the growth of the industrial population, and a surplus of cattle in Texas led to the driving of great herds north along what came to be a series of famous cattle trails; the era of the range cow country was thus inaugurated. As the railroads pushed west the cattle were driven to the termini, grazing as they went, and shipped east either for fattening in the corn belt or for slaughter in the packing plants of Chicago and Kansas City.

From 1870 to 1905 cattle ranching underwent a gradual metamorphosis. It was during this period that the western cattle industry was in its most picturesque phase. Covering a vast area which included the states of Texas, Oklahoma, Kansas, Nebraska, Wyoming, Montana, the Dakotas, Colorado and New Mexico; sparsely settled, ruled over by a hard riding and frequently lawless cowboy clan; a country of limitless plains and mighty rivers and stocked with wild game, western United States was exactly the place where great herds could roam with perfect freedom. Ranches not infrequently possessed as many as 80,000 head of cattle. Of the many customs that came to be associated with the industry on the open range the spring and fall round ups were the most interesting. The spring round up, lasting several weeks, was for the purpose of gathering together all the cattle for their enumeration, identification and distribution; the calves were branded and castrated; the mature steers were separated from the rest of the herd and moved to good fattening pastures until the fall. When the steers were between four and six years old they were trailed out and driven to the railroad termini.

Cattle thus existed on grass during both summer and winter. During the summer drought often played havoc with the herds; in winter

storms were the chief danger, for the cattle would then drift for miles in the snow and die by the thousands. It was not unusual for one fourth and sometimes one half of the herds to perish in this fashion. Losses from disease, from theft (or "rustling," as it was called) and from attacks by wild animals were also heavy.

This great and haphazard business of cattle raising, as it was carried on in the 1880's particularly, had all the marks of impermanence. Beginning with the second half of the decade a change began to manifest itself; following the terrible winter of 1887 the cattle boom definitely collapsed. The ranges had become overstocked as a result of the entry of great numbers of inexperienced persons into the industry. English and Scottish investors led on by oversanguine promoters had poured huge sums into the region to capitalize new ranching ventures. Quarantine laws passed by a number of western and central states prevented the free movement of the steers on the range; similar restrictions on the part of foreign governments cut sharply into the overseas demand for the plains cattle. The steady encroachment of homesteaders and sheep herders upon the open grazing lands and the resultant fencing of the range limited the cattlemen's field of operations. Inadequate credit facilities made the situation more difficult and the cattlemen, unable to withstand all these forces, were compelled to bow before the new conditions.

Since the early years of the twentieth century the cattle industry has undergone profound economic changes. The rising costs of land and fencing, higher freight rates and heavier taxes and capital charges have compelled the introduction of more efficient methods in the production of cattle on the range. To insure a water supply wells have been sunk, reservoirs built and windmills and gas engines installed. The use of pure bred and registered bulls has improved the quality of the herds. Finally, the industry has become definitely specialized with, broadly speaking, the following four general divisions: the maintenance of breeding herds which produce the calves; the production of stockers which are raised on the range and then shipped to the corn belt for finishing on grain; the fattening of these so-called feeders by farmers of the corn belt; the production of grass fed cattle on the ranges.

There are three systems in common use in the United States for the handling of these beef bred herds. Under the "straight beef" system the steers are grown out as cheaply as possible,

This method is adapted to regions where pasturage is plentiful and inexpensive, as in the United States, where it is the most widely practised form of beef production. Under the "dual purpose" system the cows are milked and the calves are raised on skimmed milk and supplemental feeds. This method is to be found most frequently in the general farming states. The "baby beef" system is a highly specialized method particularly adapted to the corn belt, where there exist both a good supply of feeds for fattening and ample pasture for the summer maintenance of the breeding cows with their calves. In these operations cattle growers naturally need the assistance of financial credits. In the United States particularly there has been developed a distinct agriculture credit mechanism having characteristics peculiar to the industry (*see* CATTLE LOANS).

The general methods of marketing cattle have shown little change in the past thirty or forty years. The great majority of the cattle marketed are usually billed direct by the owner, individual shipper or cooperative shipping association to a livestock commission firm located at a central livestock market. Upon their arrival the commission firm sorts the cattle and sells them to the slaughterer or speculator. There are, however, several other modern methods of marketing, of which the most important are: the direct sale to country drover for shipment to central market; shipment to central market through cooperative associations; shipment to central market direct; direct marketing to local butchers; direct sale either to a packer buyer or a speculator in the country or on the range to cooperative associations or on mail orders. Since the World War there has been a great increase in the numbers of cattle marketed through cooperative associations of livestock producers and through direct buying on the part of meat packers.

Sheep. Sheep raising has always been one of the world's chief pioneer enterprises. More than 600,000,000 sheep are distributed throughout the six land areas, the latest sheep populations for the leading countries being as follows: Australia (1930), 106,117,000; Asiatic and European Russia (1930), 100,600,000; United States (1930), 50,503,000; Union of South Africa (1930), 49,240,000; Argentina (1930), 44,413,000; India (1928), 35,506,000; China (1929), 35,000,000; New Zealand (1930), 30,841,000; United Kingdom (1930), 24,743,000; Spain (1929), 19,950,000. Within the past generation

the number of sheep has decreased in Argentina and the United Kingdom and increased in Australia, New Zealand and the Union of South Africa; there has been no significant change in the sheep population of the United States since 1900.

The distribution of sheep is materially influenced by the two general agricultural conditions of range and farm production and the two marketing conditions of the demand for wool and the demand for mutton and lamb. Of the ten leading sheep nations cited above Australia, Russia, the United States, the Union of South Africa, Argentina and New Zealand represent newly settled regions in most of which sheep production is still on the extensive or range basis; in China, India and the United Kingdom production is on a farm flock basis, where the flock is simply one element in the farm economy. Range production still persists in parts of Spain and in Hungary, while in the rest of Europe the farm flock method is generally common. Countries situated farthest from the world population centers emphasize the growing of wool because of its low transportation costs and its non-perishability. On the other hand, countries close to densely settled regions emphasize mutton and lamb production. Thus the largest volume of high grade wools comes from Australia and New Zealand, while the best quality carcasses are produced in the United Kingdom. In the United States the farm flocks in the corn belt and in the eastern and southern states carry largely mutton blood, while range flocks are chiefly of wool breeding.

Sheep were introduced into the American colonies at an early date and until 1850 were kept largely for their wool. During most of the nineteenth century because of the expanding needs of the New England textile mills the industry remained on a wool basis; and the number of western sheep, which were grown for this purpose, increased greatly. This was true particularly from 1870 to 1900. On the other hand, in the east the appearance of large manufacturing populations created a demand for mutton, with the result that sheep were grown for meat.

Range sheep, particularly in the southwest, were of low quality although they possessed traits that made it possible for them to survive in periods of long drought. On the northeastern edge of the range, in eastern Montana and Wyoming and in the Dakotas, the lambs could be stocked on the luxuriant grass and sent east as

feeders. The western sheep, very much like the range cattle, were run in large bands on the open public domain throughout the year. The industry was almost entirely in a pastoral stage; there was no investment in land or buildings; and the only capital outlays required were a camp outfit for the herder, which cost from \$200 to \$400, and the sheep, which were worth \$2 a head.

Like the cattle raisers the sheep raisers began to feel the pressure of range constriction on their industry and found it imperative to buy or lease lands in the grazing areas. In some cases this meant the acquisition of a sufficient number of small holdings in order to control watering places; in others it implied the purchase or lease of the greater part of the range. But the range operators had to give up the struggle and recent years have seen a steady reduction of their flocks. Today range sheep are to be found in the winter in the desert lands where water is available from the melting snow; in the summer they graze in the mountain regions.

Because of the increase in operating expenses the raising of sheep for wool alone has become unprofitable. The growing demand for mutton and wool, however, has made it possible for range operators to change from a strictly wool basis to one including lamb and mutton. As a result there has been developed a type of ewe capable of producing a good market lamb and a readily salable grade of wool. Another modern development is the practise of marketing at a younger age. This has been stimulated by increased costs of production and a greater public demand for lamb in place of mutton. Today the sheep industry is made up of these three divisions: the growing of sheep for wool; lamb production; and the fattening of lambs.

The financing of sheep operations differs only in detail from the financing of cattle. Sheep as security for loans are not regarded with the same favor, because the loss from weather and the depredations of wild animals is likely to be greater. There are, however, two favorable factors in the case of sheep: their early maturity and marketability and the income from the spring wool clip. Sheep credits come as a rule from commercial banks, wool warehouse companies and the livestock loan companies, some of which make a specialty of sheep loans. The usual credit is from two thirds to three fourths of the value of the flock. Up to 1923 credit facilities were adapted to the needs of the feeder or finisher rather than to those of the grower. But with the passage of the Agricultural Credits

Act, establishing Federal Intermediate Credit Banks and authorizing the formation of privately financed national agricultural credit corporations, the financial requirements of the rancher and livestock man began to be served more adequately.

Since the World War there have been two periods of heavy sheep marketing during the year: the months of May and June, when the native lambs weaned fat from their mothers are shipped; and the months of August, September and October, when the range lambs appear. This is a clear break with earlier practise. Before 1900 the meat packing industry was not organized to handle fresh mutton and lamb in the summer, nor was there a considerable consumer demand for these products. But the seasonal cycle of sheep marketing has been greatly modified by refrigeration. Of the total receipts of sheep in the United States approximately 75 percent are marketed at the public stockyards of the country; the concentration of slaughter is at four of these markets: Chicago, Kansas City, Omaha and Jersey City.

Hogs. Hogs constitute one of the most important sources of meat for human consumption and figure prominently in a proper agricultural economy. The hog is a highly efficient feeding machine: it is a user of foods unfit for man; it requires less grain per pound of meat than any other animal; and most of its carcass can be prepared as cured meat. It also helps maintain the fertility of the soil and is responsible for better farming practise because of the necessity for seasonal rotation of leguminous or nitrogenous pasture crops. The raising of hogs is easily within reach of every farmer because of their rapid multiplication and early maturity and because of the small capital investment required for their production. The amount of corn marketed in the United States in the form of hogs is in the neighborhood of 40 percent.

The world population of hogs is approximately 260,000,000. The leading producers are: China (average 1909-13), 76,819,000; United States (1930), 53,238,000; Germany (1930), 19,944,000; Brazil (average 1921-25), 16,169,000; Asiatic and European Russia (1930), 13,200,000. There are three types of agriculture in which hog raising plays an outstanding part. The first of these is corn growing, particularly when the crop becomes more important as a hog feed than a grain for human consumption. Hogs are therefore to be found in great numbers in the world's three great corn belts—central United States,

the La Plata region of South America and the Danube basin of southeastern Europe—where there has been developed a special type of hog which will convert the grain into pork and lard in the cheapest way possible. This is the so-called lard hog, a class which includes most American swine. The second type of agriculture involving hog raising is associated with the dairy industry, where hogs are grown extensively in order to utilize such by-products as skim milk, buttermilk and whey. The use for feed of these by-products in conjunction with small grains is common in the west north central states of the United States and in Canada, Ireland, Denmark, Holland, Sweden and Latvia; the type of swine produced on such a diet is the so-called lean, or bacon, hog. Potato growing, the third of these main types of agriculture, is predominant in Germany and Poland. In countries other than those mentioned in this paragraph the raising of hogs for commercial purposes is unimportant, although considerable numbers may be fattened for home slaughter on refuse from the kitchen garden and field. The hog production of the American cotton belt states, of the countries of southern Europe and of China is of this nature. Hog raising is insignificant in north Africa and southwestern Asia, because Moslem religious practise bars the use of swine for food.

The early Spanish explorers brought hogs to the gulf coast of the United States and the English settlers introduced them into the New England colonies and Virginia. Following the War of Independence the settlement of the Ohio valley led to the establishment of pork packing centers at the river towns, the chief of which, Cincinnati, became familiarly known as "Porkopolis." Artificial refrigeration was unknown and the packing season was limited to the winter months, when fresh pork was made available for city consumption. The continuance of the westward movement was responsible for the rise of Chicago as the leading hog market in the middle west; not long afterward markets sprang up along the Missouri River to take care of the hog supply from the farms in the western plain country. The advent of refrigeration in the 1870's released pork production from its seasonal dependence and insured to the consumer a constant supply of fresh meat and to the producer a ready market at all times of the year. The so-called razor backed hog, tall and long bodied with a long head and long ears, familiar to the America of the early nineteenth century, was a far different animal from the improved

type of lard hog of modern times, which has been produced by a process of crossing pure bred boars with mongrel sows.

Since 1900 hog production in the United States has remained centralized in the corn belt. Because hogs are used so largely to convert corn into pork, the hog profit on the production side depends upon the existence of a proper relation between the prices of the two commodities. This has been called the corn-hog price ratio and for a number of years 11.67 bushels of Number 2 corn were equal in value to 100 pounds of hog on the Chicago market. This relation between hog and corn prices has produced the so-called hog cycle, of four or five years' duration, during which production has gone through a regular round of expansion and contraction. As Larmer (*Financing the Livestock Industry*, p. 39-40) has described it: "Breeding at any given time is determined by the profit made from hogs during the preceding year . . . about one and a half years after hog prices touch their peak in relationship to corn prices, hog breeding reaches a maximum. This produces a surplus of hogs a year or more later. . . . Breeding, however, does not reach a low point until some time after the hog-corn price ratio has begun to rise again. . . . The relatively short swing of the whole cycle is due to the fact that the volume of hog production can be accelerated very rapidly. . . . Contrasted with cattle, hogs are bred young and reproduce before they are one year old. This is made possible by a gestation period of only 110 days. Moreover . . . hogs produce litters averaging six to eight pigs, and through careful feeding a sow may produce successfully two litters of pigs each year."

Two other factors, both of which are peculiar to the industry, influence hog prices: the existence of a large export surplus and the fact that a considerable portion of the annual product goes into storage. Changes in foreign markets are naturally bound to affect domestic hog prices. Again, because only 60 percent of the hog crop is marketed in the six months following every November, cold storage is necessary for the remainder. The meat packer is therefore called upon to act as the risk carrier while he takes care of the storage function from a time of plenty to one of deficiency.

Fully 80 percent of the hogs marketed in the United States pass through the public stockyards, the largest of which are located in the corn belt. The five principal hog markets are at Chicago, East St. Louis, Omaha, Kansas City

and Indianapolis. The United States Department of Agriculture lists the following as being the most important present day methods of marketing hogs: (1) producer shipments, including shipments to central markets, direct sale to packers and slaughter and sale of products by farmers; (2) local sale to the country drover or buyer, to the packer buyer and to the local butcher; (3) cooperative marketing through shipping associations and through auction sales.

More than half the hogs marketed in the United States are sold by the producer in the country, the rural buyer being the most important single marketing agency at work here. His strength has been based on his ability and willingness to buy small lots, to pay cash and to assume the entire risk. The recent appearance of the cooperative shipping association, however, has begun to cut seriously into the country buyers' activities, because these groups are also willing to buy small lots and at a lower cost. Because of these apparent advantages of cooperative shipping the cooperative marketing of hogs is increasing.

The prospects for the livestock industry throughout the world are bound up with the future of the food supply. There are many factors to be considered, a large number of which cannot be estimated statistically. It is certain, however, as R. J. McFall points out (*The World's Meat*), that the livestock industry will expand and consolidate on the basis of increased efficiency, which is necessary not only in production but also in the marketing process. Those who state that meat is seriously decreasing in importance as a food have overlooked the fact that there has been increased consumption in Europe during the past century in spite of the fact that meat was growing more costly than grains. It is unlikely that sheep production will continue to be confined solely to the pioneer fringe. Hog production may be expanded in certain areas of South America, Africa and southeastern Europe, while with the increase in dairying there will probably be an expansion of hog raising as a subsidiary industry. The production of beef will in all likelihood become more closely linked with general farming and with dairying. Much land which is today fit only for pasturage can be made more profitable and used for breeding herds. In the most highly cultivated areas it is likely that the less efficient types of livestock will give way to the more efficient. More intensive animal husbandry may require more labor per unit. The future of the

livestock industry is dependent not so much upon some changing fashion in human diet as upon a process of readjustment to the economic changes which are rapidly forcing all human activities to a new and lower price level. The rewards of the future will go to the most scientifically operated food industry.

LIVINGSTON, EDWARD (1764-1836), American jurist, diplomat and statesman. After successful practise at the bar and three terms in Congress, in 1801 Livingston was appointed mayor of New York and federal district attorney. He reformed the rules of procedure of the mayor's court and published in 1803 a volume of opinions delivered therein. Livingston removed to New Orleans in 1804. His fame as a jurist rests largely upon his elaborate penal code, which foreshadowed nearly every reform in penology in the last half century. Sir Henry Maine called him "the first legal genius of modern times." After six years in the House of Representatives and two in the Senate Livingston became in 1831 secretary of state under Jackson. He wrote Jackson's nullification proclamation and conducted important negotiations concerning the Maine boundary and the young Latin American nations. From 1833 to 1835 he served as minister to France. Charged to secure payment of the American spoliation claims, Livingston found the French authorities intransigent but conducted the negotiations with dignity and ability until convinced that the effort was futile.

LIVINGSTON, ROBERT R. (1746-1813), American jurist, statesman and scientist. Livingston was one of the drafters of the Declaration of Independence and chairman of the committee which drafted the first constitution of New York. In France and America he fostered experiments in steam navigation, contributed largely to Fulton's success and invented a steam engine. He introduced merino sheep into America, studied breeding and popularized gypsum as a fertilizer. Chancellor of New York from 1777 to 1801, he organized his court, formulated its procedure and by his decisions and rulings laid the foundations for the equity jurisprudence of that state. First federal secretary for foreign affairs from 1781 to 1783, he organized the de-

partment well, conducted it skilfully and directed the peace negotiations, thus preparing the way for the federal Department of State. In the New York Convention of 1788 he secured the passage of a resolution that no vote should be taken upon any part of the federal constitution until the whole had been considered, thereby preventing its defeat by the concentration of the opposition upon the most unpopular features. As minister to France from 1801 to 1804 he was instructed by Jefferson to purchase New Orleans. He was offered the whole of Louisiana, and as a result of negotiations during the time he was awaiting the necessary powers he secured the territory for the price of 80,000,000 francs; when Monroe arrived with the necessary authority, the treaty was ready for signing.

L., "Chancellor Robert R. Livingston" in *American Scenic and Historic Preservation Society, Annual Report*, no. xvi (Albany 1911) p. 311-30.

LIVINGSTONE, DAVID (1813-73), British missionary and explorer. Livingstone was sent out to Africa in 1840 by the London Missionary Society. When in 1851 he discovered that the Arab slave trade was spreading far into central Africa and blighting the prospects of missionary effort and all other civilizing work, he became convinced that this "open, running sore of the world" could be healed and the civilization of mid-Africa promoted only by Europeans present on the spot. Henceforward he persistently advocated a policy of commerce, colonization and Christianity. His historic journey across the continent (1854-56) and his Zambesi expedition (1858-64), which discovered Nyasaland, were undertaken with the purpose of finding a practicable route for colonists and traders into the interior. His search for the sources of the Nile (1866-73) was also prompted by the idea that geographic knowledge was a necessary prelude to commerce and colonization. He returned to Britain in 1856-57 and again in 1864. On both occasions his simple personality, his speeches and writings together with the fame of his exploits aroused public interest in the campaign against the slave trade and thus determined to

a considerable extent the character of the British attitude toward central and east Africa. Largely as a result of the deep impression he made on public opinion the British government was stimulated to secure in 1873 a treaty from the sultan of Zanzibar prohibiting all export of slaves and closing all public slave markets throughout the latter's dominions. The settlement of missionaries and traders in Nyasaland (1875-80) followed by the establishment there of a British protectorate was the direct outcome of his doctrine. The pursuit of the slave traders inland was one of the primary motives for the occupation and acquisition of British East Africa (Kenya and Uganda) which began in 1890. Only Cecil Rhodes has influenced British policy in Africa to as great an extent as Livingstone. It may be said that the best features of British administration from the Sudan to the Zambesi have been inspired largely by his idealistic attitude toward the African people.

LIVY (Titus Livius) (59 B.C.-17 A.D.), Roman historian. Born at Padua Livy passed his life almost entirely at Rome, where, averse to a public career, he devoted himself to study. Although a moderate republican he was a friend of Augustus. Among his productions were philosophical and rhetorical works of popular character, now lost. His principal work, consisting of 142 books, is the history of Rome, *Ab urbe condita*, extending from the origins of the city (753 B.C. according to Varro) to the death of Drusus in 9 B.C. It was probably interrupted by the

author's death. Thirty-five books are now extant; the first ten go almost to the end of the Third Samnite War in 293 B.C. and the twenty-first to the forty-fifth extend from 218 B.C. to 167 B.C.; that is, from the beginning of the Second Punic War to the end of the Third Macedonian War. The remainder are known to us only as brief summaries.

Livy is famous among the ancients for his love of truth. The part of his history that has been preserved is not, however, that which best testifies to his worth as a historian. He never made direct use of documents nor did he always apply criticism to the written sources upon which he based his work. The Roman annalists whom he follows (as Valerius Antias and Licinius Macer) are in general among the later and less truthful. His Greek source, Polybius, however, whom he follows for the history of the struggle between Greeks and Romans, is of greatest value. He lacked concrete vision of the development of Roman power, topographical knowledge that would render his accounts of wars and battles comprehensible and a thorough knowledge of ancient Roman public law. His worth is in his style and in the clarity of his narrative, which make his work an epic of Roman glories, the more effective since they are combined with a stirring and almost fearful perception of the decadence of his time.

In antiquity Livy's fame was very great, even though his work was current chiefly in larger or smaller compendia; in the Middle Ages he was celebrated by Dante as "Livius who does not err"; in modern times there has taken place a strong reaction, beginning even before Niebuhr, against the authenticity of his statements. Although these have been necessarily submitted to severe criticism, his work will nevertheless always remain of great importance as a source of ancient Roman history and as suggestive testimony of the ancient grandeur of Rome.

LLORENTE, JUAN ANTONIO (1756-1823), Spanish ecclesiastic and historian. Llorente had been ordained and had begun his career as a politician and lawyer in church and state, when, according to his own account, he abandoned ultramontanism and adopted the philosophy of reason. He entered the service of the Inquisition in 1785 and from 1789 to 1791 served as secretary of the Inquisition of Madrid. He was an adherent of several "enlightened" ministers of Charles IV and later supported Joseph Bonaparte. Llorente is an outstanding example of a tendency, widespread in eighteenth century Spanish historiography, to make much use of archive material largely in order to justify or condemn the many political and other changes of the times; he makes pretensions of extensive documentation, for example, in various works favoring restriction of papal and regional privileges. In 1809 he undertook under French patronage a study of the archives of the Inquisition, which was followed by a series of works culminating in the not very well ordered *Histoire critique de l'Inquisition d'Espagne* (4 vols., Paris 1817-18; Spanish ed., 10 vols., Madrid 1822; abridged English translation, 1 vol., 2nd ed. London 1827). In these studies Llorente charged that the Spanish Inquisition, established against popular will because of royal cupidity and papal ambition, frequently became an instrument of royal despotism; that, however, because of the secrecy of its procedure it often constituted an *imperium in imperio*; and, finally, that it was one of the principal causes of the intellectual and economic decline of the nation. These views were on the whole current both in Spain and abroad as a result of political and intellectual developments especially during the eighteenth century. Llorente's work gained its significance chiefly from its supposed authoritativeness in the descriptions of the inquisitional methods and the numerous persecutions and trials of great statesmen, scholars and churchmen, some of whom were later canonized; the total number of victims of the Inquisition, which he calculated by absurd methods, reached appall-

ing figures. Llorente's influence was apparent as early as 1812 in the report of the commission which recommended to the Cortes of Cadiz the abolition of the Holy Office. His studies served to substantiate the views of the liberal politicians, historians and sociologists of the nineteenth century as to the origin of the national ills, views which were widely held abroad also, and to perpetuate the dark representations of Spain which had originated in the international conflicts of an earlier era. Among a series of Catholic apologists seeking to refute Llorente was the great scholar Menéndez y Pelayo, who despised him as a traitor and irreligious hypocrite and accused him of bad faith. Although less partial students also have considered Llorente's work to be prejudiced and premature they have not agreed as to its relative trustworthiness. To some of them it has remained the beginning of serious documented study of the subject.

LLOYD, HENRY DEMAREST (1847-1903), American reformer. Lloyd was born in New York City, attended Columbia College and Columbia Law School and after three years' practise at the bar accepted a post on the *Chicago Tribune* in 1872. For more than a decade he served the *Tribune* on its literary, financial and editorial desks. In 1885, thanks to a competence that had been settled on his wife by her father, he was able to retire from active newspaper work and devote himself to public affairs. During the rest of his life he was the stalwart friend of all victims of economic oppression, defending, for example, the Chicago anarchists, supporting the Pullman strike, throwing in his lot with the Populist movement and championing trade

unionism, the eight-hour day and the fight on child labor. In a group of articles published between 1881 and 1884 Lloyd had already indicated his awareness of the transformation which was being effected in American economic life by the development of monopoly; this triumph of concentration he was to make the central theme of his chief work, *Wealth against Commonweal* (New York 1894), a carefully documented, realistic study of the methods by which the Standard Oil Company had succeeded in stifling competition. It was Lloyd's hope that such an analysis would arouse the American people to an appreciation of the growing peril of concentration and force the extension of government ownership to all fields "in which private sovereignty has become through monopoly a despotism over the public." While in 1898 he was ready to admit that his message had "penetrated only a short distance through the hippopotamus hide that protects the sensibilities of the people," he did not despair of the democratic processes, refusing to accept socialism's whole program because he was opposed to confiscation and the doctrine of the class struggle. Lloyd was eagerly interested in reform in Great Britain and Ireland, where he saw in "labor copartnership" (producers' cooperatives) and welfare capitalism the answers to the inequalities of private property; in New Zealand, where he found in the compulsory arbitration court the solution for industrial strife; in continental Europe, where advocates of agrarian credit systems and cooperative marketing agencies hoped to assure the permanence of a free small landholder class; in Switzerland, where the establishment of the initiative and referendum, government railroad and a state alcohol monopoly already more than hinted at the spirit and the forms of the democratic commonwealths of the future. Lloyd put accounts of these hopeful journeys into a series of books; these were to be the signposts for intelligent Americans in search of the "new conscience." Lloyd was both the first and the finest example of the muckrakers and reformers of the two decades from 1890 to 1910.

LOUIS M. HACKER

LLOYD, WILLIAM FORSTER (1795-1852), English economist and minister of religion. Lloyd was educated at Westminster School and elected to a studentship at Christ Church, Oxford University, in 1812. He became successively reader in Greek and lecturer in mathematics at Christ Church and in 1832 succeeded Whately as Drummond professor of political economy. In 1834 he was made a fellow of the Royal Society. After having held his chair for five years, as was customary at that time he retired to a living.

Lloyd's most notable contribution to economics is contained in his *Lecture on the Notion of Value, as Distinguishable Not Only from Utility but Also from Value in Exchange* delivered in 1833. This lecture gives, so far as is known, the first application of marginal analysis to explain the relation between utility and value in exchange. Although he does not use the terminology of later marginal theory he clearly distinguishes between total utility and marginal utility and shows that value is proportional to the pressure of want for the last increment of a commodity. The central idea is expounded with great lucidity and abundantly illustrated by example and analogy. His remaining eleven lectures, which he published in compliance with the statute governing his professorship, deal with the population problem and the poor laws. While accepting Malthus' main position with regard to the pressure of population on the means of subsistence, he none the less found good reasons for advocating a generous system of poor laws and was entirely opposed to the spirit of the Poor Law Amendment Act of 1834 and to the wave of opinion which that act represented.

Lloyd's style is scholarly and luminous; his reasoning clear and cogent. Although he never employs mathematical symbols, his economic analysis reveals his mathematical training. He was evidently a humane man, keenly alive to the sufferings of his age.

LOANS, INTERGOVERNMENTAL. Intergovernmental loans represent a form of financial assistance rendered by one government to another, usually in consideration of some actual or anticipated advantage to the lending country. This advantage may be direct, as in the case of financial assistance rendered to an ally in pursuit of a common war, or indirect, as when the granting of loans is aimed at preventing the financial and economic collapse of a state, whether because that state is an ally whose strength must be upheld or because its geographical, political and economic situation is such that its collapse might undermine the stability of neighboring states, the lending state included. More recently the use of intergovernmental loans has been suggested as a means of preventing violent aggression by a strong upon a weaker nation.

There are several types of intergovernmental financial assistance: the direct loan of money by one government to another, in which the creditor state procures the funds to be handed over to the borrowing state and bears the full risk in case of the latter's insolvency; the loan contracted by a group of states jointly and severally responsible—an extremely rare practise in intergovernmental finance; and government loans floated in a foreign market with the guaranty of the foreign government. This guaranty may be moral or legal: if moral, the guarantor's responsibility generally does not extend beyond the obligation to use pressure upon the borrowing state to assure the regular fulfilment of the terms of the loan; if legal, the guarantor state assumes the legal obligation to pay in case the borrowing state defaults. The guaranty frequently carries with it provisions for assigning specific sources of revenue for the payment of the loan and seldom imposes any real burden upon the guarantor state. Still another type of intergovernmental financial assistance is the subsidy; that is, the outright payment of a sum of money by one government to another without stipulation as to payment of interest or repayment of principal. This form of financial assistance has serious drawbacks. The government offering a subsidy is soon likely to meet with determined opposition on the part of taxpayers; and, on the other hand, the receiving of funds without obligation

to repay is conducive to wasteful expenditure on the part of the subsidized state. The subsidy is practically unknown today. All forms of financial assistance which involve the creation of indebtedness require the authorization of the legislative organs of the countries concerned.

Direct intergovernmental loans occur in times both of war and of peace. In the latter case, which is relatively rare, they are usually contracted for definite economic ends. Instances of direct loans in peace time are the loan of 20,000,000 gold crowns advanced by the Swiss government to Austria in 1923 to be used in the work of financial reconstruction, and the numerous short term advances made after the World War by certain European powers to Austria, Hungary and other central and southeastern European states as temporary assistance until more satisfactory long term loans could be arranged. The repayment of these loans offers no difficult problem; they are small in amount and since they are applied to an economic purpose they usually strengthen the financial position of the debtor state and enable it to discharge its obligations. They involve, however, the danger of the possible political subordination of the debtor to the creditor state. Under the pretext of assuring the repayment of the loans there may be established—not only over the finances of the borrowing state but even over its political activity—an organization of control which may eventually lead to a disguised protectorate. In order that such consequences may be avoided there have been devised international loans, advanced or guaranteed by several states; in this way any one state is prevented from acquiring and exercising a preponderant influence over the debtor state and the loan operations are given the character of real financial assistance, furnished in the interest of the borrowing state and of the community of nations.

Direct intergovernmental loans are of far greater importance in times of war. They usually occur among allied governments and constitute the quickest method of placing funds at the disposal of the borrowing government, which is thus released from the necessity of making large remittances abroad at a time when its financial resources are strained and its means of international payments seriously reduced or non-existent. Since such a loan is made at a definite rate of interest and its repayment is usually taken for granted for the time being, public opinion in the creditor country is likely to be favorably disposed toward the transaction. The funds are ordinarily employed in paying for purchases of

war materials and food supplies in the lending country, and economic activity is accordingly stimulated. Furthermore as the money lent by the government remains in the country, the problem of transfer—the most serious problem in international payments—is avoided, at least at the outset of the transaction.

The first major instances of direct intergovernmental loans in times of war were those advanced by the French government to the United States during the War of Independence. The amount of the several loans contracted between the years 1777 and 1783 was spent almost entirely in France in payment for supplies. The debts were completely repaid in 1795, in part by means of direct payment to the French government and in part through the transfer of funds to its account in the United States; these it used in payment of its American obligations. The following are instances of direct loans in the nineteenth century: the loan of £600,000 by Great Britain to Portugal in 1809, to be repaid in annual instalments at the rate of £57,170; and the loan of £2,000,000 by Great Britain to Sardinia in 1855, to be used in equipping an army of 15,000 men to serve against Russia in the Crimean War. Portugal paid its annuities until relieved from further payments by the Treaty of Vienna in 1815. Sardinia's repayments were at an annual rate of £80,000; by 1869 it had repaid £1,100,000 and still owed £1,662,547 on the principal.

Intergovernmental loans found their widest application during the World War. This period offers the most remarkable instances of direct loans in war time, not only because of the size of the sums and the range of the countries involved but also because of the political and economic difficulties besetting the liquidation of the loans. The series of war loans was initiated by Russia, which in October, 1914, applied to Great Britain for financial assistance. In 1915 France, Great Britain and Russia established the principle of pooling their financial and military resources. In the same year France sent gold to England on demand of the Bank of England in order to enable the British government to pay for purchases made in common for the account of the Allies. Some months later France demanded in turn the opening of credit for 1,500,000,000 francs. The gold sent to England was to be returned after the war, after the repayment of the credits advanced to France. The French government remitted to the British government non-negotiable short term Treasury drafts, renewable and re-

payable not later than one year after the conclusion of peace, which were to bear interest at the same rate as that paid by the British government on its loans. France and England extended loans to Belgium, Russia, Serbia, Italy, Rumania, Greece and other countries. With the financial exhaustion of France, Great Britain alone continued to make loans. Beginning in 1917, when it entered the war, the government of the United States became the principal creditor of the Allied countries. It loaned at first only to England, which in turn distributed among the Allies the funds thus obtained. Later the United States loaned directly to the various associates. After the Armistice the United States continued to make direct loans, which were used in payment for the purchase of American war supplies left in Europe, in financing the shipment of food to starving European countries and in the task of general economic and financial rehabilitation of Europe. The war loans as well as the post-Armistice loans were acknowledged by the remission of Treasury bonds bearing the signature of the borrowing state and carried stipulations as to interest and date of repayment. The accompanying table gives the structure of the interallied debts.

When the loans were undertaken little or no attention was paid to the economic difficulties involved in making large international payments. The borrowing governments expected that common victory would make the settlement easy: the conquered would pay the expenses of the war. During the negotiations of the peace treaties nothing was stipulated regarding the settlement of intergovernmental loans. After some years, however, the United States raised the question of repayment. In 1922 the foreign debt funding bill passed by Congress reaffirmed the principle of unconditional payment of interest and principal and provided for the refunding of the Allied debts by the issue of securities with maturity of twenty-five years, bearing an interest rate of not less than 4½ percent, the rate paid by the United States government on its domestic war loans. This act called into being the funding debt commission, which initiated a series of funding agreements between the United States and the European debtor countries. While all agreements specify the repayment of the principal, they deviate from the original provision of the funding debt bill with respect to the period of repayment and rate of interest; repayment is distributed over sixty-two years, while the interest rate, in all agreements lower than the

original $4\frac{1}{2}$ percent, varies in the different agreements in accordance with a hypothetical "capacity to pay" of the respective countries. Thus the agreement with Great Britain specifies 3 percent for the first ten years and $3\frac{1}{2}$ for the remainder of the period. In the Belgian agreement the pre-Armistice debt bears no interest, the post-Armistice debt is charged with a small but gradually increasing rate of interest, reaching $3\frac{1}{2}$ percent in the eleventh year and remaining at that level thereafter. In the agreements with Italy and France the debts carry no interest for the first five years; the interest rate rises from $\frac{1}{2}$ percent to 2 percent in the case of Italy and from 1 percent to $3\frac{1}{2}$ percent in the case of France. The agreements with minor debtors follow in general the lines of settlement laid down in the agreement between Great Britain and the United States. Great Britain at first favored general cancellation of all war debts. Confronted, however, with the policy of the United States, it concluded funding agreements with its debtors, having previously laid down the principle that under no circumstances would it collect more from its debtors than the amount of the payments which it would be called upon to make to the United States. France too concluded funded agreements with its debtors.

The repayment of intergovernmental loans of

such magnitude, however, gives rise to a series of political, economic and financial difficulties. Even assuming a formal willingness of the debtor governments to live up to the terms of the agreements, public opinion in the debtor countries generally contests the very principle of the loans, claiming that their proceeds were spent in the common interests of the debtor and creditor countries. In the case of the interallied debts the moral claim is strengthened by the fact that the European debtor states made greater physical sacrifices than the principal creditor, the United States, which made only a late entrance into the war. Even though these claims have no legal validity they have great moral force. Moreover the long period of amortization made necessary by the huge sums involved places the burden of repayment upon new generations, which will increasingly resent the payment of annuities.

Still more serious are the economic and financial difficulties of repayment. The raising of the annuities adds to the fiscal burden of the impoverished debtor countries. Furthermore the funds raised by the debtor governments are in national currency and must be converted into foreign exchange acceptable to the creditor nation. The only way to obtain international means of payment is by selling merchandise and services abroad; but in doing so the debtor countries

are confronted with the opposition of all the other countries, the creditor country included, for no state will permit its markets to be invaded by the exports of the debtor states. There is little doubt that the attempts to collect the war debts aggravated the general policy of excessive protectionism characteristic of the post-war period and contributed largely to the general economic crisis which set in in 1929. The serious fall in prices after that year further added to the burden of indebtedness, both because of the disastrous effect of the falling price level on international trade, the main source of international payments, and because of the general appreciation of the monetary unit in terms of purchasing power.

An additional source of difficulty is the link between the Interallied debts and the reparation payments (*see REPARATIONS*). Although the United States officially refuses to recognize any connection between these two categories of indebtedness—a position which is undoubtedly correct from the strictly legal point of view—it is nevertheless increasingly evident that the connection is vital. It is not likely that the European countries will continue to pay the United States unless they receive the payments due to them from Germany, and it is still less likely that Germany will ever resume payments on account of reparations. Although in 1932 the United States is still adhering officially to the principle of payment of debts, a revision of the debt problem appears inevitable. The Hoover moratorium of 1932 suspending the payment of intergovernmental debts is an expression of the impasse which has been reached in the attempt to collect the war loans.

Of wider application than direct loans are government loans floated in a foreign country with the guaranty or recommendation of that country. Debts so contracted are called commercial as distinguished from direct intergovernmental war loans, which are referred to as political debts. Governments appear more disposed to repay the former than the latter. The suspension of a political debt or the refusal to pay it does not jeopardize the credit of a state: it is always easy to find pretexts to justify the non-payment or to insist upon a reduction or cancellation. On the other hand, in the case of commercial debts contracted with individuals or private banking institutions suspension of payment or demand for total or partial cancellation signifies state bankruptcy with all its disastrous consequences to the credit standing of the country. It is largely because of this circumstance

that governments desirous of lending financial assistance to foreign governments prefer the form of a loan advanced by private financiers backed by governmental guaranty. The intervention of the government may manifest itself in the form of moral pressure on the financial community to finance the loan or may be confined to a mere authorization of the loan issue. Whatever the form adopted, the state is not the direct lender; the debt is consequently commercial and is more difficult to repudiate than a political debt.

This form of financial assistance is used only rarely in times of war. In 1795 Great Britain guaranteed the payment of interest on a loan amounting to £4,600,000 floated on the London market by the emperor of Germany, who in turn undertook to employ at least 200,000 Austrian soldiers in the war against France. The payments were made for three years, after which England was obliged to assume the services of the debt. In 1797 a new agreement was concluded for the guaranty of a loan of 1,620,000 francs in order to reimburse the English government for its advances. Austria did not pay the interest and the English Exchequer carried the full amount. The debt was finally liquidated in 1823. Another instance of governmental guaranty of a loan floated by another government is offered by the Turkish loan of 1855. In order to stimulate a more vigorous prosecution of the Crimean War on the part of Turkey, France and Great Britain jointly guaranteed a loan of £5,000,000 to that country, issued in London and secured by specific Turkish sources of revenue. In case of default Great Britain was to assure the payment of interest and principal with a recourse against France. Turkey was to reimburse both countries. The obligations of the loan were regularly discharged until 1875, when they were first reduced and then suspended. From 1876 the British government assured the payment of the obligations and in 1879 France was called upon by England to furnish its contribution. The financial liquidation of Turkey in 1880 led to the organization of international financial control, under which Turkey was able to pay the obligations of the loan until the World War.

Loans guaranteed by governments are more frequent in times of peace. The guaranty is given either in order to aid a state in financial distress, usually at the close of an unsuccessful war, or in order to manifest an assumed protectorate over it. One of the earliest instances of such loans was that to Greece in 1833, when that country was

financially exhausted by the War of Independence. In order to stabilize the new kingdom and furnish it with financial resources France, Great Britain and Russia guaranteed a loan of 60,000,000 francs. It was issued in three sections, British, French and Russian, each power guaranteeing a third of the services of the loan. The payments by Greece were irregular until they were definitely secured in 1859 by the appropriation of specific government receipts. The same powers also guaranteed the Greek loan of 1898, when the country was ruined by the disastrous war with Thessaly. The loan amounted to 170,000,000 francs, and the payment of the services was secured by the appropriation of receipts under strict international control. This guaranty, which was extended to all subsequent Greek loans as provided by the act of control, was not resorted to. In 1932, however, the suspension of payments on the external debt by Greece raised the question of guaranty. A similar guaranty was extended to Egypt in 1885: a loan of £9,000,000 was guaranteed by France, Germany, Austria-Hungary, Great Britain, Italy and Russia; the obligations were regularly discharged under international control and the guaranty was never invoked. The Austrian loan of 1923 amounting to 585,000,000 gold crowns was guaranteed by France, England, Italy, Czechoslovakia, Belgium, Sweden, Denmark and the Netherlands, each nation guaranteeing only a fraction of the loan. Each guarantor state remitted bonds to the Swiss National Bank in recognition of its responsibility. These bonds are payable on demand in case of default on the part of Austria. The repayment of the loan was secured by appropriation of substantial sources of revenue under the control of the League of Nations. The Czechoslovakian loan of 1932 was guaranteed by France.

An instance of the guaranty of a loan accorded by a state as a manifestation of a protectorate assumed by the guarantor government is offered by the Tunisian loan of 1884 guaranteed by France. After the establishment of its protectorate over Tunis in 1881 France wished to suppress foreign interference in Tunisian finance. As a result of arrangements with Great Britain and Italy it repaid the Tunisian debt, which was supervised by international commission, and to this end caused the Tunisian government to issue a loan of 17,550,000 francs, for which France gave personal guaranty. Under the protectorate of France the financial administration was improved; the guaranty was not invoked.

The device of a moral guaranty of foreign loans is of growing importance. Although relatively rare prior to the establishment of the League of Nations, an early instance may be found in the moral guaranty accorded by Great Britain and France to the loan of £120,000 floated by Uruguay on the London market in 1846. Neither France nor Great Britain assumed any legal financial responsibility toward the creditors and there was no organization of foreign control over the administration of the loan. Other instances of a moral guaranty include the loans to Santo Domingo in 1907 and Nicaragua and Honduras in 1911, which the United States guaranteed morally by assuming the control over the receipts which were assigned for the payment of services. The practise found considerable extension in the period of financial rehabilitation after the World War. The economic and financial disorganization of numerous European countries, with its attendant menace of economic and social upheavals, induced the stronger states to come to their aid with loans which were accorded the moral guaranty of the League of Nations. Such are the loans to Austria in 1923, to Hungary in 1924, to Greece in 1924-27, to Bulgaria in 1926 and 1928, to Danzig in 1925 and 1927 and to Estonia in 1927. In 1926 Armenia solicited the intervention and moral guaranty of the League but did not obtain it, since the Soviet Union could not offer any effective security. In obtaining such guaranty a definite procedure has been evolved. After having previously negotiated with the principal nations belonging to the League the state in distress solicits the intervention of that body. The Council of the League instructs its Committee of Finance to institute an inquiry and to draw up a plan of aid; this is prepared in collaboration with the government seeking the loan and is then submitted to the Council. If it is approved, the protocol is drawn up and presented to the petitioning government for approval. The protocol contains the recommendation of the League that the bankers finance the loan, and it is in this recommendation that the moral guaranty lies. The guaranty has practical value. The protocol always stipulates the appropriation of ample receipts to be used in discharging the obligation arising out of the loan, the appointment of foreign commissions to protect the rights of the creditors and the organization of a more or less strict control over the public finances of the borrowing state by a delegate of the League. In case of difficulties between the delegated com-

missioner and the debtor state the decision is left to the Council of the League.

A further extension of the principle of guaranty in intergovernmental finance is contemplated in the project of an international convention adopted by the Assembly of the League in 1930. This provides that in certain cases and under specified conditions the Council of the League may decide to accord financial assistance to a state which is a victim of or threatened by aggression, if it thinks that peace can be assured in no other way. The financial assistance of the signatories to the convention will assume the form of a legal guaranty of a loan contracted by the state in need. Member states were asked to become parties to the convention beginning in January, 1932. The convention cannot come into force until a minimum of three signatories will have pledged a sum of at least 50,000,000 gold francs for the annual service on the loans to be guaranteed, and it will be concluded for a period extending to the end of the year 1945. The convention will remain in force for successive periods of five years, with the power of revocation two years before the expiration of the current period.

LOANS, PERSONAL. The term personal loans is used here to denote loans for personal rather than business uses, for consumption rather than production purposes. It is often difficult, especially in an agricultural society, to distinguish between the two types of loans: the difference

between loans to a farmer who has consumed his seed as food and now needs money to buy new seed and to a farmer who has made allowance for seed but needs food is a narrow one. In urban life too it is often difficult to classify a small loan made to a small merchant or artisan; even pawn-broking loans may serve as the basis for a small business venture. From a historical point of view the differentiation of loans for personal consumption from those for business purposes became possible only when the merchant began to maintain special accounts for the management of his business undertakings and when the firm became clearly distinguished from the private household.

Personal loans as here understood are sometimes used, as in the case of instalment sales (really loans with the purchased article as security) and loans for the purchase of commodities which might otherwise be bought on the instalment plan, to provide for additional purchases of a type which are not absolutely necessary but possess varying degrees of desirability. The rationale and institutional arrangements for such loans are discussed elsewhere (see *INSTALMENT SELLING*). Sometimes personal loans are contracted to cover the conventional needs of a social class accustomed to elaborate expenditures, such as formerly were involved in the court service required of the knights; in modern times the extravagance of the *jeunesse dorée* offers an analogy. In the great majority of cases, however, personal loans represent an attempt to cover deficiencies in the supply of necessities occasioned generally by some emergency which has made unexpected demands upon the resources of the borrower. Illness, death, accident or loss of some kind may tax normal income excessively. Normal and even reduced expenditures may require supplementation where normal income is inadequate or has been temporarily reduced by illness, accident or unemployment. Where loans are sought for the purpose of covering non-recurring expenditures or temporary deficiency in income, subsequent normal income may be sufficient to wipe out the debt. But where the latter is too heavy or where the normal income never reaches the normal expenditure, the loan may become an agency for peonage and enslavement.

Originally personal loans without any special recompense for the lender may have prevailed. The members of a clan, a town, a religious society, were expected to help their fellows with their surplus means. This aid among friends and

relatives appears in a more advanced society in the Biblical injunction requiring that the wealthy loan to the poor without charging interest. Although assuming the form of a loan, the aid is thought of as a charitable deed. He who is blessed with possessions gives of his abundance. No business deal is intended in this connection, nor is there any question of interest: the giving is done *gratis et amore*; as expressed in the Sermon on the Mount in *St. Luke* (vi: 35) *nihil inde sperantes*.

This ideal of altruistic communal help gave way rather early, however, to the demand on the part of the lender for compensation for the time during which he was deprived of the use of that which he had loaned. Thus among the Melanesians a young man who borrowed from the chief for the purpose of purchasing a bride had to return eleven strings of cowrie shells for every ten borrowed. Révillout states that the loan at interest was developed in Mesopotamia, whereas Egypt retained the interest free loan down to the time of Bocchoris.

The development of an agricultural economy produced a different economic basis for loans, while increasing their extent and social significance. These loans were made occasionally by the temples but ordinarily by the large landowners, who demanded and received both interest and security. Even at the time of Hammurabi Babylonian peasants were deeply in debt to the large proprietors because of loans of seed grain or cattle. In Greece Hesiod records the heavy burden of indebtedness to the large proprietors and the same phenomenon is found in Rome. Loans may be productive in an agricultural economy in the sense that seed or cattle borrowed or purchased with borrowed funds may produce enough to permit payment of some interest. But borrowers in such an economy are generally unable to repay the loan, especially if a high interest is charged. Reduced to want by illness or crop failure, while they may be enabled by a good crop to repay the interest and part of the principal they can rarely repay both interest and principal with enough to spare to sustain them until the next harvest and to provide seed for the following year; they are thus often reduced to a position of semipermanent indebtedness which becomes permanent in case of a crop failure. Because of the uncertain character of agricultural return the Babylonian law released the debtor from the payment of interest in a year of crop failure, but not when his failure to raise a crop was due to mere negligence. War with its

burden of military service and its devastation of the fields increased the hazard of these loans. The destruction of the Attic peasantry by the Decelean War and of the Roman by the Punic wars resembled the consequences of the wars of the seventeenth and eighteenth centuries in eastern Europe. Like the consumption loan, then, the agricultural loan becomes a basis for extortion and oppression. It was against such abuses that the prophets of the Old Testament and the Greek philosophers raised their voices and the Roman legislators tried to limit at least the rate of interest. The church in the Middle Ages forbade the lending of money at interest among Christians.

The lender was usually content to keep the debtor in a state of dependence through high interest charges. He could, however, utilize his power to dispossess the debtor of his homestead. Isaiah cries out against those "that join house to house, that lay field to field" (v: 8). Foreclosure and the sale of the debtor into slavery, which were permitted in many ancient societies, were generally not premeditated. Fundamentally every loan is based upon the creditor's expectation that the debtor will be able and willing to repay—that is, upon the honesty and ability of the debtor.

This reliance on the character of the debtor, however, was early supplemented by many forms which are still used to prove the existence of the debt, to enforce payment or for both purposes. The most effective proof was a written record, particularly a note signed by the debtor. In the absence of such records the creditor might invoke witnesses to support his claim in court. One of the earliest forms of security, which was at once proof and guaranty, was the pledge. The Bible, while permitting the use of this device, provided that a poor man's pledge must not be kept overnight (*Exodus* xxii: 26; *Deuteronomy* xxiv: 12-13). Loans on pledges at interest seem to have been employed by the Melanesians even before the coming of the whites. Where no pledge was used, the creditor might demand the guaranty of a third person, who would become responsible for the debt should the debtor fail to pay. The precarious position of the guarantor is frequently commented upon in the Apocrypha, while Cheilon of Sparta said "If you go security, you are in misfortune." The surety device forms one of the corner stones of the modern system of small loans (*q.v.*).

In the collectivist feudal society consumption loans to individual serfs played a minor role.

The position of the serf was more or less static and was bound up, through the strip system of agriculture, with that of the entire manorial group. The peasant's share in the land was practically inalienable and the responsibility of his maintenance in times of emergency was accepted by the lord of the manor. In the towns the guilds provided mutual insurance against certain exigencies. Even in the Middle Ages, however, townspeople were forced for one reason or another to appeal to the money lender, as is evident from the importance possessed by pawn-broking at that time.

The important consumption borrowers during the Middle Ages were the kings, the ecclesiastical lords and the feudal nobility. Certain of the loans made to these borrowers were related to emergencies, such as foreign wars; knights who participated in the crusades, for example, were forced to borrow for the purpose of arming and maintaining a fighting force for a long period of time far from their native land. Often, however, they were merely to cover, in anticipation of revenues from the feudal or sovereign realm, certain more or less regular expenditures or payments. Important among the latter were the papal dues levied upon the various ecclesiastical lords; a well developed system of loans was organized in Rome, apparently with papal approval, to permit the lords to make their payment to the Curia before they had collected the dues for their districts. Attendance at court entailed heavy expenditures, while the luxurious tastes contracted by many of the crusaders through their contact with eastern civilization resulted in a higher standard of living and a continued need for funds.

While the town of antiquity was the seat of landowners who engaged also in lending out money, the mediaeval city was a city of merchants. The merchant supplied the requirements of the feudal aristocracy. In the course of transactions on credit the merchant very often made his noble customers dependent upon him, so that finally land and rights fell into the hands of the lender.

Spendthrift and ambitious monarchs alike found themselves in constant need of additional funds. Loans to needy sovereigns were frequently made by prominent mediaeval merchants, such as the Bardi and Peruzzi of Florence, who lent money to the kings of France and England during the fourteenth century; the Fuggers, who did the same for the Hapsburgs; the Medici, who furnished the financial basis for the

power of the popes. Since these loans were based in last analysis upon the lender's good standing with his sovereign, they involved considerable risk. A pope, such as Sixtus IV, hostile to the Medici might turn the administration of the Curia over to others, leaving the Medici in a very difficult position. The Bardi and Peruzzi suffered heavily from the bankruptcy of Edward III in 1345 and the Fuggers from the national bankruptcies of the sixteenth and seventeenth centuries.

When the national state replaced the absolute ruler personal loans for the consumption needs of the sovereign gave way to other forms. The continuity of the state, with the consequent possibility of standing loans, was first established in the mediaeval cities; this idea was transferred to larger territories and to national states through the constitutional monarchy. But the idea of the state as a borrower for consumption purposes, which was dominant in the public finance before the emergence of the national state, still exists in such expenditures as those for war and armaments (*see EXPENDITURES, PUBLIC*).

During the seventeenth and eighteenth centuries the lords, who borrowed heavily to finance the high expenditures imposed upon them by attendance at court and by the necessity of providing annual levies, were forced either to introduce more efficient methods of management on their estates or to surrender them to their creditors, who farmed them more efficiently. Thus the increased consumption needs of the landed nobility indirectly contributed to the technological improvements which characterized agriculture in this period.

During the greater part of the Middle Ages the foreign merchant and money lender had dominated the business of providing personal loans. The person in need, disliking to reveal his plight to his neighbor, frequently turned to the foreigner, even though the latter imposed harder conditions upon him. Among the foreigners may be included the Jews, who although they had no home other than their place of residence, were generally considered foreigners because they had no community with the parochial church. They were exempt from the general canonical prohibition against usury. The Jews were generally admitted to a particular city only on sufferance, for a limited period of time and on condition of the payment of an annual due. From time to time they had to pay extraordinarily burdensome tributes; they were expelled from England and France in the thirteenth cen-

tury and from the German imperial free towns in the fourteenth century.

During the thirteenth century the dominance of the Jews was challenged by that of the Lombards, who generally came as fiscal agents of the pope for certain purposes and engaged in money lending on their own account. They were generally subject to the same legal restrictions as the Jews, and contemporary literature indicates that they were economically more exacting than the latter and were equally condemned by the people of the time. Since they were under the protection of the pope the Lombards did not suffer, as did the Jews, during the crusades; although the poor complained of their high interest charges, the rich found it advantageous to invest their surplus funds with these pawnbrokers. Another important foreign group of money lenders were the Caorsini, or Kawerschen, so-called after the city of Cahors in Provence. Schulte has shown that the name Caorsini was a generic term for usurers in the thirteenth century and that the Caorsini who settled in southern Germany as pawnbrokers, money changers, tax farmers and minters were actually exiles from the city of Asti. The Sieneese who went to England as tax collectors for the pope were also called Caorsini. Loans at interest were also made by religious institutions, by the nobility (who, particularly in the vicinity of Cologne, loaned to other nobles) and by wealthy native burghers. In many territories the Jews were readmitted because they charged a lower rate of interest than that ordinarily charged by other money lenders. They enjoyed a very considerable influence during the eighteenth century in the eastern monarchies of the European continent, especially under the dynasties of the Hohenzollerns and the Hapsburgs.

The promissory note in connection with loans was greatly developed in the Middle Ages. Notes were often so drawn as to nullify all objections, including those of the canon law, and to effect a speedy payment. Knights departing for the crusades signed bills in Genoa and Venice which obliged the guardians of their castles to repay the Italian merchants at one of the next fairs in Champagne. In the south notes were usually drawn up before a notary public, while in northern Europe they were recorded in the town records in the presence of the town magistrate. The pawned pledge also continued of such importance that it was customary to invest part of one's property in goods which could easily be pawned, such as table silver and jewels. Insignia

of power were also pawned. The English crown was pawned with Italians and with Hanseatic bankers. Pope Martin was forced to threaten Cosimo de' Medici with excommunication in order to regain the miter pawned by Pope John XXIII.

The interest rates on personal loans were very high during the Middle Ages, the customary rate being about 43 percent per annum. In order to ease this tremendous burden on the needy various attempts were made to found under religious or charitable auspices institutions which might loan funds at lower rates. One of the earliest of these was the attempt to establish pawnshops, controlled either by a religious order or by some governmental agency, which would loan funds on pledges at much lower rates of interest (see PAWNBROKING). Unsuccessful attempts to establish institutions such as those which later came to be called *montes pietatis* were made at Freising in Bavaria in 1198, at Salins in Franche-Comté in 1350 and in London in 1361. The first successful *mons pietatis* was established by the Franciscans in Perugia in 1462; it was followed the next year by one in Orvieto, and others sprang up rapidly throughout Italy. Loans were made at the rates, low at the time, of 4 to 12 percent, which covered administrative expenses and paid a small interest charge on the capital invested. Protests by the Dominicans against any charge for the loan precipitated a religious conflict which was not quelled until 1515, when the Lateran Council approved the Franciscans' institutions and method of functioning. The *montes pietatis* spread chiefly throughout Italy, Belgium, Germany and France. In 1777 there was set up in Paris by the French government a *mont-de-piété* which has been maintained continuously ever since; municipal pawnshops are also operated by many French cities, while pawnshops which are operated by various governmental agencies are common on the continent where they function either as monopolies or in competition with private pawnbrokers.

In addition to these public and charitable pawnshops various other agencies to provide personal loans have been developed. Although credit cooperatives are generally for production loans, some of them provide only personal loans; others furnish both types. In addition various special facilities for small loans have grown up, particularly in the twentieth century, to provide small personal as well as business loans and have integrated these types of loans more definitely

in the credit structure of the modern economic system.

LOBBY. The lobby has yet to live down its past. So frequently has it been associated with the efforts of the unscrupulous to secure legislation for their selfish ends that an unfavorable connotation has persisted. The lobby has usually been brought to public attention because of its derelictions and has been represented on such unfortunate occasions by the least savory of its practitioners. Privilege seekers, it can be safely assumed, are always to be found about legislative bodies. A scandal merely serves to remind the public of their presence. Efforts to direct the process of lawmaking by pressure from selfish outside interests were made in the First Congress. In March, 1790, William Maclay wrote in his journal concerning the struggle to pass the bill funding the national debt: "I do not know

that pecuniary influence has actually been used, but I am certain that every kind of management has been practised and every tool at work that could be thought of."

An outstanding early case was that of Manassah Cutler, who secured aid for his land promotion scheme in 1786 by sharing profits with influential members of Congress. Professional persuaders in the past have exerted all their wiles to secure favorable action for the interests that employed them. Gaming resorts, such as Pendleton's "Palace of Fortune," are said to have been their places of rendezvous. Sam Ward was one of these adventurers who won recognition as a legislative fixer.

The term lobbying was not applied generally until after the middle of the last century. It was the scandals of the 1870's that challenged public attention. The investigation into the Pacific Mail Steamship subsidy lobby revealed great sums expended for bribing government officials and legislators. Cakes Ames as agent of the Crédit Mobilier unabashedly sought to exchange railroad shares for legislative support. The demand for the enactment of measures to curb the lobby came to nothing. A feeling grew that many congressmen failed to consider the national welfare. The lobbyist was regarded as the agent of big business seeking to corrupt the representatives of the people. Beliefs of this sort added to the strength of the Greenbackers, Populists and other reformist groups. The railroads and large corporations were suspected of improper dealings with legislative bodies; nor were all of these suspicions without foundation. The New York investigation of 1905 reported upon the efforts of insurance companies "to procure or prevent the passage of laws affecting not only insurance but a great variety of important interests to which through subsidiary companies or through the connections of their officers they have become related." It was found that enormous sums had been expended in a surreptitious manner. In varying degree the situation which was disclosed in New York held true for a number of other states as well.

The quickened interest in political and social problems coming in the decade after 1905 had its effect upon the lobby. The farmer, the laborer and the reformer decided that it was to their advantage to maintain permanent offices at the capital. Special interest representatives openly undertook systematic campaigns to influence the course of legislation. Muckraking, "trust busting" and reforms in governmental structure

stimulated people toward a direct exercise of their power in politics. The direct election of senators worked some change in the distribution of political influence, and the overthrow of "Cannonism" disrupted the domination of the House by a few men.

The investigation of the lobby prompted by President Wilson in 1913 demonstrated that a change had occurred in the methods of influencing legislation. The old secretive means of persuasion proved their ineptness under changed conditions. Those seeking favorable action made demands on the government in the name of the voters they claimed to represent. The World War served to stimulate the organization of such groups. Trade associations grew in size and number, trade unions increased their membership, and individuals in many walks of life through recourse to the various associations that stood for particular interests found their relations with the government simplified. The expansion of governmental services and regulatory agencies has increased and complicated the points of contact between citizen and official. It has made the government a potential factor of aid or of interference in a multitude of day to day operations. Some special interest spokesmen come to the capital seeking profit; others are afraid not to come.

Virtually every interest of any national importance has its spokesmen in the capital, and the state legislative bodies find themselves confronted with similar agencies. Current problems bring appropriate propaganda agencies into existence; fundamental social and economic interests are represented by permanent and substantial organizations. In the case of the latter lobbying is but one phase of their activities, while with the former persistent agitating is their only justification for existence. The attainment of their goal means desuetude unless another cause is soon found. Moreover there are some societies that exist merely to lobby and to solicit support for their organizers from the gullible on the strength of unprovable boasts of success in influencing legislation. Congressional investigations have time and again exposed such quacks, scoundrels and frauds.

The many able and honest lobbyists carry on their work year after year unnoticed and unknown to the general public. They are recruited largely from the law, from journalism and from the government service. Former legislators have sometimes become conspicuous lobbyists. Not a few are technical experts or scientists; some are

business men and some professional promoters or reformers. These men regard themselves as the representatives of the voters who compose the membership of their respective leagues and associations. These organizations usually hold annual conventions, where policies are discussed and a program is agreed upon for the coming year. Frequently a legislative committee is charged with the task of lobbying for those measures which the convention designates. Most lobbyists claim that they are simply carrying out such instructions.

In an estimate of the power of a lobby the cohesion of the membership is of as much importance as its numerical strength. In the final analysis it is the lobby's control of votes that constitutes its means of forceful persuasion. It can evoke the threat of appealing to the congressman's constituents against his position. A well organized minority of determined voters working together for definite purposes constitutes an element that cannot be ignored in any campaign. Few legislators refuse to compromise in such a situation. The lobbyist by closely following the course of legislation and watching the votes upon questions of concern to his organization keeps his supporters informed. Usually they are simply urged to write to their representatives requesting favorable action, although sometimes the lobby participates in election campaigns. It is easy, however, to overestimate the effect of such activities. The lobbyist is largely concerned with supplying information to congressmen and appearing at committee hearings. As expert witness and as spokesman for special interests he aids in the consideration of technical legislation and moreover assists in the enactment of acceptable laws.

Whether in seeking to influence legislation by campaigning for candidates who will not oppose his policies or in persuading those already in office to take a sympathetic attitude the lobbyist is careful to preserve a strictly non-partisan position. He has certain definite aims to achieve and he finds little to gain through identification with one or another party. In fact party discipline would create a conflicting loyalty. The lobbies most strongly entrenched are able to command the votes of blocs in the legislature without regard to party affiliation. All the important lobbies can depend upon the support of a few congressmen or senators. These men sponsor the measures framed by the lobbyists, introduce their propaganda into the *Congressional Record* under the privilege to extend remarks and then

permit its distribution by congressional franking. They attempt to secure prompt action on the lobbies' bills, reading the speeches and using the arguments supplied them by these interests. A bloc of faithful supporters in the legislature is the strongest weapon the lobby can have. Many congressmen are members of one or more organizations that have occasion to seek legislative favors. The American Legion, for example, can depend upon the aid of the legionnaires in Congress for most of its measures. The Legion lobbyists work in closest cooperation with them, drafting bills, securing hearings, presenting evidence, rallying aid from the home districts and seeking press support.

It is the realization of the power of propaganda that has made present lobbying methods what they are. Abuses are not so crude as in the early days. Bribery no longer plays a part, but backing can be bought through the more subtle means of supplying favorable publicity or assistance in campaigns. The public utilities corporations, for example, in attempting to build up a favorable public attitude directed their propaganda not only to public officials and the press but likewise to the schools and to research institutions. In varying degree other economic interests and reform leagues strive to foster public support for their cause and then use this favorable opinion in appealing to legislators. They insist that they represent great forces within the community: some do, while others must first create the opinion they later reflect.

The evils to which the present lobby gives rise are deception and coercion. The forces of a group opinion can be vastly exaggerated by skillful manipulation and used to threaten a public official. Cowardice is a common political weakness and one that permits lobbyists often to be taken at their own evaluation. Most of the legislation for the regulation of lobbying simply demands of the lobbyist that he appear in his true colors. Measures regulating the lobby have been advocated since the 1870's; a bill "to prevent professional lobbying" was introduced in the Fifty-third Congress; several further efforts were made in later congresses, the Sixty-third Congress being especially active in investigating and attempting to pass regulatory legislation. Five bills were introduced in the session of 1927 and four in 1929-30. Extensive inquiries into lobbying activities were made by Congress in 1913 and in 1930. Although there is as yet no federal law on the statute books, thirty-two states have enacted some form of regulatory legislation. In

Georgia the constitution of 1877 declares lobbying to be a crime. Massachusetts in 1890 and Wisconsin in 1899 were the first states to pass laws requiring the registration of lobbyists. Many of the other states have adopted this same principle in their laws. The lobbyist must give his name and that of his employer and indicate the legislation with which he has been concerned. His employer must file a statement of expenses. Publicity was thought sufficient to provide the necessary protection. The proposed federal laws adopted the same safeguard.

The laws thus far enacted have not been entirely successful. Registration in itself does not challenge public scrutiny, and inadequate provisions for enforcement render such lists well nigh meaningless. In fact the existing laws in many cases are not strictly observed and serve little purpose. In framing a law it is difficult to define lobbying in terms that will check the deceitful and dishonest and still not restrict the citizen's right of petition. An effective law must require more than registration yet should not hamper those who wish to make known their views to legislators. Laws cannot be made in isolation from those who will be affected by the law. Successful lobbying can be conducted through the mails; propagandists need never meet their subjects face to face; yet communication with congressmen could scarcely be supervised. Wealthy groups may create a semblance of popular support by artificial means, and even a relatively poor but well organized group may develop sufficient synthetic opinion to give the appearance of a widespread public interest. Can such activities be curbed without affecting the right to free association for common purposes? A system for disclosing the name and connection of all those lobbying together with a full report as to their expenditures might prove useful if strictly enforced and widely publicized. The term lobbyist would have to be carefully defined and narrowed in its application. Some check upon the accuracy of the reports made would be necessary.

It is futile to attempt to legislate the lobby out of existence. The lobby has become part of the American system of representation. It provides a means whereby a form of functional representation is made to supplement the geographical system. With the political parties failing to take a definite stand upon controversial issues agencies concerned with the promotion of a particular issue or definite interests become necessary. Lobbying organizations exist because thousands

of citizens give them support. This is evidence of a feeling that some matters are of so much concern to the welfare of the individual that the formal system of political representation is not adequate. The citizen apparently believes that certain affairs vital to him may fail to receive the consideration they deserve. He is willing to undertake the trouble and expense of supporting a lobby in the belief that it will better protect his interests and perhaps secure favorable legislation.

While the informal and inadequately regulated lobbying in the United States fills a need it leaves much to be desired. Misrepresentation and lack of balance are inevitable. Propagandists and self-seeking promoters may exercise an influence far in excess of their relative social significance. The cry of special interests tends to drown the plea of the general interest. The public has no lobby. In many European countries economic councils have been instituted to bring together in an orderly array representatives from the various economic classes of the nation. The creation of a board composed of economic experts who would call upon national associations for advice in national planning is now being considered for the United States. While it is doubtful that lobbying would be absorbed in the activities of such a body, the according of a degree of official recognition might introduce some order into the existing informal and disorderly system of functional representation. The unimportant and "fake" organizations might thus be eliminated and the lunatic fringe of reformers clipped.

As a whole, however, the present day lobby cannot be dismissed as an abnormal appendage to the legislative body. It has become a political institution. Whether its potentialities result in good or evil depends not only upon the lobbyists themselves but upon the public and the government.

LOCAL FINANCE comprises the fiscal activities of the primary as well as the intermediate units of local government. The scope and problems of local finance depend therefore primarily on the position of local government within the general governmental system of the country. The size of the local units, the scope of functions entrusted to the local bodies and the extent of central control over local activities all affect the structure of local finance. Diverse systems of local government have produced a corresponding variety of local fiscal organization. The term local finance is also used to designate that part of fiscal science which deals with the principles underlying the financial organization of local government.

The distribution of administrative functions between the central government and local authorities has been influenced not only by political but also by financial considerations. The central government has usually reserved for itself those functions which it considers indispensable to the safety and stability of the state. On the other hand, governmental functions which clearly redound to the benefit of the local population have been assigned to local authorities. Still other functions have been entrusted to special local bodies, such as school districts, park districts and public utility organizations (in Germany, *Zweckverbände*), which were organized for the purpose of supplying specific local services. Parallel to the functional distribution of expenditure between the central and local powers there has also evolved a gradual distribution of revenue between the two spheres of government. This division may assume various forms: specific sources of revenue are assigned to the respective authorities; or one sphere of government, usually the local, is permitted to add supplementary rates to the existing state taxes; or a centrally administered tax is shared with localities or a locally administered tax with the central authorities; or, finally, the arrangement may involve a complete concentration of tax revenue in the hands of one, usually the central, authority, which in turn undertakes to finance the local activities in the form of subventions and grants-in-aid.

Neither on the expenditure side nor on the revenue side is it possible, however, to draw a clear line of demarcation between the two spheres of activities, and the fiscal interrelationships vary from country to country and in point of time within the same country. In Great Britain and the United States the local bodies may

exercise only the specific powers bestowed upon them by the Parliament and state legislatures respectively. In continental countries, on the other hand, the prevailing practise is to distinguish between necessary, or mandatory, and permissible, or optional, expenditure. The first group originally included items of expenditure in which the local population had very little interest; for instance, the supply of housing facilities for the army. Later a more liberal attitude prevailed. The mandatory expenditures, prescribed in general terms by the central authority, ordinarily include expenditure on education, elections, some phases of the administration of justice and to an increasing extent measures of social welfare, such as poor relief, labor exchanges, unemployment relief, child welfare and juvenile courts. The enforcement of the mandatory provisions is greatly facilitated by the extensive control of central authority over local authorities in European countries. The superior authority may refuse to approve the budget which contains omissions of mandatory expenditure or may even insert the mandatory expenditure into the local budget. Beyond the mandatory expenditures, however, the local bodies enjoy considerable freedom in widening the scope of expenditure, subject of course to general restrictions with regard to tax limits, limitation of indebtedness and similar regulations.

The increase of local expenditure in practically all countries is due in part to the widening range of purely local governmental activity and in part to the assignment to local authorities of certain governmental functions which, although

general in scope and significance, can best be performed by them. The rate of increase has been considerably accelerated since the World War, particularly in the fields of social welfare, education, poor relief, highway construction, housing and unemployment. Notwithstanding extensive grants-in-aid and subventions by the central authorities to localities to satisfy the increasing demands for revenue, the financial position of the local governments in almost all countries has become extremely strained in recent years. The significance of local expenditures becomes more obvious when it is realized that the chief item in national expenditure consists of payments for national defense and for service on public debts. With these sums deducted the percentage of local to total expenditure on regular public administration amounted in 1925-26 to 82 percent in Great Britain, 57 percent in France, 71 percent in Belgium and 54 percent in Italy.

Generally speaking, the development of local finance in modern times moves in the direction of centralization of revenues and decentralization of expenditures. The democratic demands for additional government services and post-war economic distress have created a heavy drain on public finance. The more the governments have been compelled to satisfy those demands, the more the authorities have had to resort to local administration. The increasing role of expenditures for social services may be seen from the following figures: In Great Britain the expenditure on social services (other than expenditure out of loans for capital purposes) reached in 1929 the amount of £403,950,000 as compared with £63,000,000 in 1910. Unemployment claimed £53,296,000; health insurance, £38,570,000; widows', orphans' and old age contributory pensions (for those between sixty-five and seventy years of age), £26,445,000; old age non-contributory pensions (for those over seventy years), £35,780,000; war pensions, £51,375,000; education, £100,510,000; reformatory and industrial schools, £690,000; hospitals, maternity and child welfare work, £11,418,000; housing of the working classes, £35,598,000; relief of the poor, £44,997,000; lunacy and mental deficiency service, £5,271,000. Of the total amount £94,164,000 was raised by local taxation, £184,018,000 by parliamentary votes and grants of the Treasury and the remainder by contributions, rents and the like. The administration of these services is chiefly done through the local authorities. In Germany of the total local expenditure amounting in 1928-29 to 8,241,900,000 marks

NATIONAL AND LOCAL EXPENDITURES IN SELECTED COUNTRIES

| COUNTRY | YEAR | EXPENDITURES (IN 1,000,000) | |
|---------------|----------------|--------------------------------|--------|
| | | NATION- AL | LOCAL |
| Great Britain | pounds 1925-26 | 668 | 414 |
| France | francs 1925-26 | 38,971 | 10,510 |

| Japan | yen 1929-30 | 1,736 | 1,753 |

* Includes expenditures of the states, amounting to 4184 million marks.

† Includes expenditures of Hanseatic towns, amounting to 622 million marks.

‡ Includes expenditures of the states, amounting to 1990 million dollars.

Source: Figures for Great Britain, France, Belgium and Italy are taken from Germany, Statistisches Reichsamt, *Finanzen und Steuern im In- und Ausland* (Berlin 1930) p. 650; other figures cited from official sources of the respective countries.

(inclusive of 621,900,000 marks spent by the Hanseatic towns) care of the poor, minors, invalids, unemployed and insane claimed 2,186,600,000 marks and education 1,556,800,000 marks. Housing, scarcely known as an item of public expenditure before the war, required in 1928-29 an expenditure of 1,542,400,000 marks, of which 1,119,700,000 marks were spent by local bodies.

In the United States local expenditure has shown a continuous increase and in 1929 it reached the total of \$7,126,100,000. From 1923 to 1929 the proportion of local expenditure to the combined total of all public expenditure in the United States increased yearly. In 1929 education accounted for \$1,925,500,000, highway construction for \$1,169,900,000 of net local expenditures, the remainder being distributed among various items, such as cost of government administration, protection, various measures of economic development and social welfare.

The widening scope of local expenditure was not, however, accompanied by a corresponding movement in the field of local revenue. On the contrary, the trend in revenue collection in recent years is unmistakably in the direction of greater centralization in the hands of national or state authorities. Legislation in post-war Germany brought about strong centralization of revenue in the hands of the federal government. The local authorities are prevented from levying any tax which the federal government chooses to reserve for itself. The revenue system in Soviet Russia is almost completely centralized. Even in the United States, where decentralization of revenue has gone furthest and where originally the bulk of state revenue was derived from locally administered taxes, the tendency is unmistakably in the direction of state administered and locally shared taxes.

The necessity of centralizing revenue and of transferring a considerable part of the local tax burden to the central authority is dictated largely by the limitations inherent in local taxation within a national economy. As compared with the facilities of the national government the possibilities of raising revenue by local bodies are quite limited. All forms of indirect taxation are practically closed to local authorities. They are unable to levy customs duties, although they may collect the so-called *octrois*; that is, duties levied on goods entering town. In France and other countries *octrois* at one time yielded enormous returns and often constituted the chief source of municipal revenue. They have, how-

ever, been universally condemned as interfering with internal trade, and the cost of their collection is very high. France has therefore adopted a policy of gradual suppression of *octrois* and in 1918 abolished the local levies on beverages, compensating the communes by a special fund, *contributions indirectes*, created from national sources, the proceeds of which are distributed annually among the local communities. In 1930 in France 968 communes still collected *octrois*, with a total yield of 964,000,000 francs. In Belgium and Holland *octrois* were prohibited and replaced by direct grants of the national governments to local bodies. The new Italian tax code which became operative in 1932 abolished all *octrois*; by way of compensation the national government assumed the payment of salaries to school teachers and judicial officers, hitherto an item of local expenditure.

Local bodies are also virtually precluded from the possibility of collecting excise duties; in fact, local excise taxes are doomed to be defective, they are easily subjected to evasion and graft and may undermine a federal or state tax of the same character. Similarly a local sales tax is technically an anomaly. Local bodies, particularly municipalities, may exact an indirect tax by charging high prices for services supplied by municipal public utilities. Considering the danger of such indirect taxation, the tendency is to impose legislative limitations on the amount of profit allowed such enterprises.

Nor are all forms of direct taxation suitable sources of local revenue. The inheritance tax is clearly unsuitable: it would introduce abnormal variations in the revenue system of the locality and would lead to evasive practises, aggravated by the inevitable tangle of jurisdictional tax disputes and multiple taxation. All attempts to introduce a local inheritance tax in Great Britain have been rejected. The corporation tax and the income tax are equally unsatisfactory as local taxes; in both the base transgresses local boundaries. The difficulties which are involved in localizing the wealth of the corporation or the income of the taxpayer would render any such taxation largely inoperative or arbitrary. In pre-war Germany the states were forced to restrict the localities in their levying of income taxes. In Holland, where for generations a local income tax constituted the backbone of local revenue, yielding approximately three fourths of all municipal taxation, the government finally prohibited local income taxation in 1929 and established instead a centrally administered com-

munal fund which is redistributed among the local bodies according to population and other indices, such as assessed wealth and the average public expenditures on police, education and public assistance.

Local income taxation failed chiefly because of the difficulties involved in the apportioning of taxable income to different taxable areas and because of the resulting diversity of tax rates in different communities. Consequently the only possible solution left to local authorities is the levying of separate taxes in rem (*Realsteuern*, real taxes), either in the form of specific taxes on land, buildings, local business, securities and wages or partly in the form of a classified property tax. A special surcharge on local real property and business is perfectly justified, as they are usually the principal beneficiaries of the bulk of local expenditure; the value of real estate in a locality increases with high local "beneficial" expenditures on roads, sewers, water supply, lighting, health, fire and police protection and educational facilities. Where a certain expenditure clearly redounds to the benefit of a specific property, the device of a special assessment or betterment tax should be applied to cover the cost incurred. More often the beneficial character of the local expenditure is of a general nature and calls for a general tax on the benefited property. Where, however, the localities perform functions which are clearly of a national character, where the maintenance of a "national minimum" of efficiency, such as a certain standard of education and public health, seems indispensable to the welfare of the state, the national treasury should subsidize the localities in the performance of such functions.

The application of the principle of benefit in local taxation has been unduly attacked by some fiscal writers but is well established in fiscal legislation. Thus the Prussian *Kommunalabgabengesetz* of 1893, which was the most noteworthy pre-war legislative act concerning local taxation and is in the main still in force, stressed the necessity of basing local taxation on benefit and services rendered and consequently encouraged fees and special assessments. It assigned to the exclusive use of the localities taxes on land, on buildings and on business. Just before the World War the tax on the increment of land value (*Wertzuwachssteuer*) found wide application in German municipalities; it was later absorbed by an imperial tax of similar nature. In Great Britain the bulk of local taxation is derived from the rates levied on the

occupier of real property. In the United States the proportion of revenue from property taxation to total local tax revenue amounted in 1930 to fully 92 percent, ranging from 98.74 percent in Oregon to 75.76 percent in Alabama. In nearly three fourths of the states property tax revenue amounted to more than 90 percent of all local tax revenue. A number of states have even attempted a complete separation of sources by assigning to localities the exclusive use of the general property tax. It was hoped that this measure would remove the incentive for underassessment and would result in a generally fairer distribution of the burden of taxation. Although the application of this measure resulted in increasing local revenue in many instances it fell short of the general expectations which prompted its adoption. Moreover the rigid application of the principle carries with it the danger of rendering the tax system too inflexible. Local taxation in the United States could be much improved by the resolution of the general property tax into its constituent elements—that is, into a series of specific taxes on income yielding property—or by its transformation into a classified property tax with different rates for each type of property.

The financial disparity resulting from the widening scope of local expenditure and the limited base of local taxation accounts for the increasing importance of national contributions to local treasuries. In 1925-26 the proportion of local revenue derived from grants-in-aid, subventions and centrally administered but locally shared taxes amounted to 25 percent in Great Britain, 21 percent in Belgium, 13 percent in France and 11 percent in Italy. In Germany the localities were compensated for the rigid limitation upon their tax revenue by assignment of a portion of the centrally administered taxes. In Soviet Russia practically the whole local revenue is supplied from national revenue. In the United States the state grants to localities amounted in 1925 to an average of between 7 and 8 percent of total local revenue for all states, ranging from 0.8 percent in Kansas to over 27 percent in Wyoming. Also of growing importance is the share of revenue derived by localities from taxes administered by the state; in 1925 they yielded 4.1 percent, in 1928 5.6 percent of the total local tax revenue. In many states the shares granted to local bodies are by way of compensation for the withdrawal of certain classes of property from local taxation; in others, they constitute an outright grant in response to increasing financial needs of local governments. The shares are al-

lotted on various bases: tax revenue, assessed valuation of property, financial needs of the respective localities; the state subsidies and the shares of state taxes accruing to localities are frequently assigned to special functions, such as education, highway construction and others, which although originally of local nature have acquired an increasing general significance.

A system of national or state subsidies may also be used as an effective means of equalizing the distribution of expenditure and the tax burden between wealthy and poor districts. This is applied on a large scale in England. London has created special equalization funds from which a part of the local revenue obtained by taxation of the wealthier districts is redistributed among the poorer districts. France gives special subsidies to the poor provinces, and the German government has recently undertaken a thorough investigation of the taxing capacities of local districts with a view to a more effective distribution of local expenditure and revenue.

The increasing interest in local finance since the World War has produced important legislation, particularly in the field of the fiscal interrelationships between the central and local authorities. The British Local Government Act of 1929 represents a remarkable piece of legislation and is especially noteworthy for its solution of the problem of grants-in-aid and the relation of national and local finance. It devised a scheme of local taxation relief by providing that the national Treasury assume the whole burden of local taxation of agricultural property and three fourths of industrial and freight transport hereditaments (real property). For this reason the British national budget for 1932-33 has increased the total amount of grants to local bodies to £136,000,000, of which £46,000,000 is on account of local taxation relief, £51,000,000 in educational grants, £15,000,000 for housing and £11,000,000 in police grants. In France, where the *centimes additionnels*, or supplementary rates, imposed upon national direct taxes constituted one of the important sources of local revenue, the approach to a reform of local taxation is much more conservative. Its interesting feature is the possibility of extensive use of house rentals for tax purposes (a reformed progressive *contribution mobilière*). The law of 1926 granted to the local bodies the right to levy twenty-three different kinds of local taxes, of which the most important are taxes on net revenue of buildings and land, on house rentals and business offices, on servants and vehicles. But even a liberal applica-

tion of all of these taxes does not solve adequately the problem of balancing the local budgets. Of great interest are the Dutch law of 1929 and the numerous financial settlements (*Finanzausgleiche*) in Germany, Austria, Switzerland and other countries which are attempting to solve the problem of the relations between federal, state and local finance.

Recent development of local finance in European countries shows centralization not only of revenues but of local borrowing as well. In Great Britain the local loans policy is highly centralized and supervised. In France the contracting of a debt requires the approval of higher authorities, in some cases that of the president of the republic. Restrictions of similar nature exist in practically all European countries; some attempt not only supervision of local indebtedness but centralization of local borrowing as well. Thus in Germany the Deutscher Zentralgiro- und Sparkassenverband serves as the central credit agency of the local bodies. The Belgian central institution, the Crédit Communal, provides communes with loans on a cooperative basis. In Great Britain the Public Work Loan Board advances money to local authorities for public works, chiefly for sewage, water supply and housing. In France the law of 1931 called for central provision of local credit through the Caisse de Crédit aux Départements et aux Communes.

In the United States local indebtedness has increased rapidly in recent years; in 1928 it amounted to \$11,106,000 as compared with the states' indebtedness of only \$1,502,000,000. Local borrowing has been encouraged by the exemption of local government bonds from taxation and by the constitutional and legislative limitations on local taxation. Most of the loans have been floated for the purpose of highway and school building construction. Although the per capita indebtedness is not abnormally high, the fact that the proceeds of the loans are used largely in non-revenue producing expenditures greatly endangers the balancing of local budgets in the future. The recent practise of issuing tax anticipation warrants carries with it grave dangers to the financial solvency of local governments. Most state constitutions contain provisions restricting the total amount of local indebtedness, which is usually fixed in some relation to assessed valuation of property within the locality. Some states prescribe the purpose for which loans may be contracted; others limit the period of maturity; still others prescribe the submission of loan

projects to a popular referendum. Although limitation of indebtedness is a step in the proper direction, constitutional restrictions are found to be too rigid and expert opinion favors legislative or administrative regulation as the more flexible form of control.

The administrative aspects of local are similar to those of national finance. In most countries local authorities have adopted some form of budgetary procedure, in which they frequently follow roughly the practises regulating the formulation, organization and execution of the national budget. In the United States the local budget system is far from satisfactory. The complicated and overlapping system of local administration prevents proper budgeting. The extent of central control over the fiscal administration of the local governments varies considerably from country to country. In Germany, France and other European countries control is quite rigid and effective. Even in the United States, where local governments have enjoyed the widest freedom from state supervision, most states have in the last fifty years adopted measures of control of varying rigidity and effectiveness. Nearly every state has some form of audit of local finance, but only a few states have a really effective system of control. The tendency, however, is everywhere unmistakably in the direction of subjecting local administration to a more effective supervision by central authorities.

LOCAL GOVERNMENT. In general local government may be said to involve the conception of a territorial, non-sovereign community possessing the legal right and the necessary organization to regulate its own affairs. This in turn presupposes the existence of a local authority with power to act independently of external control as well as the participation of the local community in the administration of its own affairs. The extent to which these elements are present must in all cases be a question of degree. For there is inevitably an ultimate limit to the freedom of action of the local authority, as otherwise it would occupy the position of a sovereign state; while it is likewise obviously impossible for all the citizens to participate at all times in the acts of the local authority. It should also be borne in mind that insistence on modern electoral systems and decision by majority vote as the only valid criteria of local autonomy would exclude many significant phenomena, such as the Indian village, where decision goes by the general sense of the community.

The familiar distinction between states, such as France, in which the organs of local government were created by and are subordinate to the central government and those, such as England, where local government preceded the central power is of less importance than is generally supposed. For in the older European countries central and local institutions have usually interacted over a long period of time; and in the process both have been developed. Furthermore local autonomy has never been secure from infringement by the mere fact that the organs of local government preceded in point of time the rise of the central power; while, on the other hand, in some of the newer countries outside Europe local authorities enjoy remarkable freedom despite the recency of their creation.

In England the actual origins of local government are unknown. Township and hundred and shire go back to the days before King Alfred, at least five hundred years before the arrival of the central administration in the twelfth century. The county is a feudal or prefeudal unit, the parish an ecclesiastical unit of great age, the borough a product of the middle ages. The ancient boroughs managed from an early date to establish some kind of local council and obtained various rights, privileges, immunities and

franchises from the king or the local lord, generally acquired in exchange for money payments and usually embodied in a charter. In the counties, however, the only regular form of government until the end of the nineteenth century consisted of centrally appointed officers, such as the sheriff, the lord lieutenant and the justices of the peace. Practically all the county officers were subject to appointment by the crown, although since Tudor times justices have been selected from local men. Although organized primarily for judicial purposes these justices performed also a number of administrative and legislative functions and were always subject to the control of the King's Bench.

By the time of the popular reform movements of the nineteenth century the government of the towns, for long left virtually unsupervised by the central government, had in some places fallen into decay and in others was struggling with obsolete forms to satisfy the needs of growing industrial communities. Three years after the Reform Act of 1832 the first Municipal Corporations Act reconstituted the boroughs on new and uniform lines. The previous year had seen the reorganization of the poor law and the establishment of the elective boards of guardians who were henceforth to be responsible for its administration. During the next half century various ad hoc elective or appointive boards, such as highway, sanitary and education boards, were set up, each confined in its scope and purpose to a prescribed statutory function. In the last quarter of the century these boards were swept away and replaced by local councils possessing general powers. Thus in 1888, four years after the third Reform Act, the Local Government Act set up a county council in every administrative county; in 1894 a further statute initiated the urban district councils, rural district councils and parish councils. In 1929 the poor law authorities after a separate existence of three and a quarter centuries were merged in the general local authorities. In England more than in any other leading country local history and spontaneous local growth have determined the shapes and sizes of the various areas, but Parliament has formulated the type and structure and functions of the authorities which administer those areas.

The administration of Gaul under the Roman Empire permitted at first a considerable degree of municipal autonomy but this developed later into bureaucratic centralization. As a result of the weakening of the power of the central government of France under feudalism the towns

acquired new liberties and privileges by agreement with the feudal lords. When the royal power began to gain ascendancy over the great lords, the centralizing tendency started afresh; and from the fourteenth century the autonomy of the chartered towns was gradually extinguished. The culminating point was reached under Louis XIV and Richelieu, who placed intendants by the side of the old provincial governors to act as agents of the crown. In the *pays d'élection*, which constituted about two thirds of the country, the intendant was in complete control and all power, including that of taxation, was gradually drawn into his hands. In the towns and communes there was a confused mass of authorities, formerly elective but by the seventeenth century largely hereditary and purchasable.

The Constituent Assembly in 1789 abolished the intendants, swept away the old provinces and created eighty-six departments, each presided over by a prefect; the disorderly array of cities, boroughs, towns and villages was replaced by the universal commune—in accordance with the principle of equality, which was considered applicable to local authorities no less than to individuals—administered by an executive board not subject to control or dissolution by the central government. These boards came into frequent conflict with the central power and after numerous unsatisfactory experiments the centralized system was readopted under the Directory and Napoleon. By the side of the nominated deliberative authorities were placed executive officials—prefects, subprefects and mayors—also nominated by the emperor and responsible to him. In spite of various subsequent innovations, such as the introduction of popularly elected municipal councils, the French system of local government, even to the present day, may be regarded as the creation of Napoleon and more remotely of Richelieu. The influence of the French system has been immense although not continuous, not only in the smaller neighboring countries such as Belgium but in the larger states such as Italy, Japan and to some extent Germany.

The history of the German cities goes back to the time when the Roman camps and colonies on the rivers of Germany formed the nuclei of towns. During the later Middle Ages they attained a position of unrivaled freedom and power, and during the twelfth and thirteenth centuries their prestige and autonomous status entitled them to be regarded almost as city-states. From the thirteenth century until the rise of princely absolutism in the seventeenth powerful

leagues of towns were formed for political, economic and military purposes, such as the Swabian league in south Germany, the League of Rhenish towns and the famous Hanseatic League, which included about ninety ports and towns in Germany, Sweden and the Netherlands. The Thirty Years' War (1618–48) was disastrous to many of the German towns, and they were further weakened in their powers of self-government by the conflict which developed during the seventeenth and eighteenth centuries between the small oligarchical family groups into whose hands the city government had fallen and the vocational guilds whose growing strength led them to demand a share in municipal administration. The absolutism of this period was most pronounced in Prussia under the Hohenzollerns; the avowed policy of Frederick William I was to appoint mayors who were completely subservient to the royal will.

The Prussian Municipal Ordinance of 1808, embodying the liberal reform program of Baron vom Stein, abolished election by guilds and corporations and established a popular assembly to elect the town council, which was to "control the entire administration of the municipality in all its branches." The executive was to be elected and controlled by the council, although in the large cities the burgomaster was to be nominated by the crown from a list submitted by the council. Police functions were withheld from the local authorities, although they might be devolved by the state on the local executive. For the next fifty years the history of municipal government in Germany consisted in the working out of the Stein reforms in Prussia and their adaptation to the needs of other leading German states. Retarded by the conservative reaction following 1830 and advanced by the aggressive liberalism of 1848, the movement for responsible local autonomy eventuated in the comparatively reactionary code of 1853, which subordinated the council to the executive, reclaimed for the state government the control that it had given up half a century earlier and replaced the secret and equal franchise by a three-class system of voting based on incomes. But one very important concession to local autonomy was the power conferred on local authorities to do whatever they might consider necessary for the welfare of the city. In this way there arose the practice of granting to German cities general powers to carry out anything not contrary to the law of the land. At the same time the code provided that the sanction of the superior authorities would in most

cases be required. The enactment of the republican constitution at Weimar in 1919 did not alter essentially the relation of the states to the municipalities, although in certain fundamental respects, as, for example, with regard to finance, it strengthened the national government to the detriment of the states and the municipalities. Most of the separate states reorganized their systems of local government between 1919 and 1924.

Several of the divisions within each state in Germany, such as the province, the rural circle (*Landkreis*) or town circle (*Stadtkreis*) and the commune (*Stadtgemeinde* or *Landgemeinde*), serve both as areas for the deconcentrated administration of state functions by officers and bodies directly responsible to the state and as areas of self-government by elected local authorities. There are in this way two distinct systems existing side by side. A "central" service in Prussia as in France is usually administered by a territorial servant or delegate of the responsible ministry. This may be an official, such as the *Regierungsrat*; a mixture of officials and laymen selected by local authorities and approved by the central government; or as a third alternative the locally elected authority acting as agent (the *Landrat* and *Kreisausschuss*). The local state officials exercise police functions, which in Germany include matters relating to public order and safety, the enforcement of the public health code and the building laws. The state control over local authorities may be exercised by two or three grades of supervisory authorities in addition to the state ministries.

There is much diversity in the various systems of local government prevailing in Germany, and at least half a dozen distinct types can be distinguished. But in nearly all of them the outstanding characteristics are, first, the existence of both a representative or deliberative body and a separate executive organ and, second, the predominant position occupied by the burgomaster, who is not only the chief of the executive but also frequently the president of the deliberative or legislative council. The burgomaster has always held a commanding position. He is a salaried official appointed by the local authority for a long term of years or for life, whose function it is to control and direct the action of the locally elected council. He is at once a state official and a municipal officer.

In Russia traces of a rudimentary form of local government are to be found as far back as the sixteenth century in the meetings of the landed gentry in garrison centers to elect town com-

manders and assessment officers. The gentry in each province became in this way a sort of county corporation. Other groups were formed for suppressing highwaymen and robbers, the elders being elected by popular assemblies drawn from all classes. Officers were also elected for fiscal administration. All this machinery was used by the state for its own purposes to such an extent that its operation came to be regarded as a burden rather than a privilege. In the seventeenth century, when Russia was being reconstructed by the early Romanovs, the local elective system broke down and was superseded by a centralized administration under commanders responsible to Moscow. But the remnants of self-government persisted, particularly in the village communities of the serfs (see VILLAGE COMMUNITY), and at the end of the century the towns were granted powers of municipal government which were placed in the hands of the upper merchant class. In 1775 under Catherine II the gentry were organized to participate in provincial government and were formed into a closed hereditary order with corporate rights. A subsequent development made the government of each province the joint business of the imperial official and the elected representative.

The most striking change in prerevolutionary Russia took place in 1864, when Alexander II introduced a large scheme of local government reform as a liberal reaction against his father's autocratic rule. The zemstvo act provided for the establishment of provincial and district zemstvos based on popular election in some thirty-four provinces. They were given extensive duties in regard to such matters as poor relief, highway maintenance, hospitals and public health, the promotion of education and agriculture. The civil parish (*volost*), a communal unit which is thought to be traceable to the mediaeval period, was revived for administrative and judicial purposes on an exclusively peasant basis.

These local government reforms in Russia, like the Stein reforms in Prussia, were essentially connected with the emancipation of the serfs. It was no mere chance that only three days after the signing of the Emancipation Manifesto of 1861 a commission was set up at St. Petersburg to work out a scheme of rural local government. The rule of the feudal lord had been abolished and a system of civil administration was required to replace it. The liberated serf was now a citizen and was entitled as such to participate in the government of his locality. The zemstvo movement became the field of a long and bitter con-

flict between the reactionary government bureaucrats, the believers in absolute monarchy and the serfless landlords on the one hand and the liberal democrats who desired to promote political progress on the other. The popular basis of the *zemstvo* was weakened in 1890 by the introduction of the class principle of representation. Every event of national importance, such as the revolutionary outbreak of 1905, the Russo-Japanese War and the World War, was significantly reflected in the status and progress of the *zemstvos*.

The introduction of the soviet (*q.v.*) technique by the revolutionary government of 1917 transformed the administrative as well as the legislative machinery of Russia. The basic unit of the highly centralized hierarchy of soviets was the functional economic group, limited to workers or peasants but otherwise popular in its electoral and deliberative procedure. Although the older administrative areas associated with the *zemstvo* regime have been found a convenient apparatus in a period of transition, the attempt is being made to substitute gradually a new system of regional division better adapted to the realities of economic geography. During the early years of the transition period the urban local units were the dynamic factors in the consolidation of proletarian power, but with the growing realization that many of the crucial questions involved in economic planning centered in the rural areas attention began to be directed to the problems of the local village. The long established tradition of local communal deliberation has proved itself capable, with a slight leavening of active supervision by resident members of the Communist party, of removing from the shoulders of the overburdened bureaucracy many of the day to day problems of local administration, particularly in the field of agricultural production.

The tradition of local government has been especially strong in Hungary and Bulgaria despite the fact that both suffered for a number of centuries the autocratic domination of Turkey. The tradition of a vigorous and to a unique degree independent county government controlled and administered in the interests of the military—and later agrarian—nobility is traceable to the times of the first Hungarian king, although it did not become firmly established until the fifteenth century. During the succeeding centuries the former vigor of the central government was extinguished, at the hands first of the Turks and then of the Austrians; but the sense of Hungarian integrity and of administrative continuity per-

sisted, on occasion flaring up into aggressive nationalistic movements, in the county assembly (*congregatio*) of the "aristocratic republics," in the county courts and among county administrative officials, such as the sheriff (*foispán*). As a reflection of the democratic movements of the nineteenth century the county organization was widened, representation being granted to the newly enfranchised peasant communes. In 1876 and still further in 1891 the autonomy of the counties was restricted by the delegation of new powers to crown officials, while in the latter year the county was divided into circuits presided over by justices of the peace. The traditional administration of the Bulgarian commune derived from the Slav rural organization. Even under the Turkish conquest various towns and villages obtained privileges, such as the right to elect their own mayors and elders, which were not infringed until the eighteenth century. Provided the requisite contingents for the Turkish army and other forms of tribute were duly furnished, an almost complete measure of self-government was accorded to the localities, a tradition which has persisted with some modifications down to the modern period of centralization.

The tradition of local government in Spain is intimately bound up with the separatism which is such a marked characteristic of Spanish administrative development (see REGIONALISM) and with the struggles of the town (see MUNICIPAL GOVERNMENT) and leagues of towns (*hermandades*) to acquire privileges (*fueros*) during the late mediaeval period and to preserve them against the encroachments of the later centralizing monarchs. The essentially municipal character of the local government movement in Spain is reflected in the early administrative problems of the Spanish colonies in America. In contrast to the English and the French the Spanish colonizers organized the administrative areas around municipalities. Both in the early colonial period and in the later democratic movements of the nineteenth century—in the mother country as well as in the colonies—the struggle for the acquisition and preservation of local liberties was the function to a striking degree of the towns.

In the English as well as in the Spanish areas of the New World the early forms of local government were largely determined by the influence of the mother country. In the United States some twenty-four municipal charters were granted during the colonial period (1641-1765), not all of which, however, were effective. The charter in colonial times emanated from the

crown and issued through its representative in the colony, the governor or the proprietor. The early colonial charters followed closely the English model, and even after the revolution the charters still bore a strong resemblance to the original type. During the colonial period there was little opportunity for extensive development in this field. The English settlers brought with them ready made conceptions of law and government, and from the beginning the new municipal corporations, which reproduced the leading features of the English model regardless of their suitability, lacked vigor. The insistence on corporate rights, corporate property and corporate privileges was transferred to American soil at a time when their usefulness had already passed in England. The idea of the public welfare had little place in English ideas of local government during the colonial era. The American municipalities declined rapidly in quality and attainment during the eighteenth century.

In 1796 Philadelphia adopted a form of city government whose principles closely resembled those on which the state and federal governments were organized. It consisted of a bicameral system with select and common councils chosen for three years and one year respectively by the electors of representatives. The systems of checks and balances and the principle of the separation of powers were embodied in the new constitution. A similar constitutional tendency was followed in many other cities.

One of the main effects of the revolution was that municipal charters were no longer granted by the governor but by the state legislature. The charter, in short, became a statute. This entirely modified the relations between municipality and state. Under the old regime the cities were entirely free from legislative interference, whereas they now fell under the complete domination of the state legislature. In consequence municipal autonomy was virtually destroyed during the second half of the nineteenth century. Little progress was made in American city government until the introduction of the commission plan in Galveston in 1901 started a movement for the abolition of the separation of powers in local government and demonstrated the advantages of a strong executive. At the same time a number of states began to confer home rule powers on the cities, thereby relieving them of subordination to the state legislature.

The county is the most common area of local government in the United States, and here again the English ancestry can be traced. Most of the

American colonies had been divided into counties before the revolution, and toward the end of the seventeenth century elected boards or justices of the peace carried on local administration in a manner not unlike that prevailing in England. After the Civil War counties were created throughout the country and new responsibilities placed on their shoulders. The old system of elected officials still prevails as a rule in the counties and no attempt has been made to establish adequate representative councils.

The English influence has also been important in the self-governing dominions of the British Empire, with the notable exception of the Union of South Africa, which has as yet failed to evolve a satisfactory form of self-government for other than municipal areas. In Canada the first city charters were granted to Quebec and Montreal in 1832. Municipalities were created throughout Lower Canada in 1854. Each of the separate provinces of the dominion has power to organize within its area whatever system of local government it chooses, and most of the municipal authorities have been constituted by the provinces during the last fifty years. They are founded for the most part on English principles with certain modifications borrowed from the United States.

In Australia again the colonial period has left a lasting mark. The early settlers took possession of the entire country, which was then administered by a governor in the name of the king. It was later divided into a number of colonies, each with a separate government exercising authority throughout its territory. No organ of local government was evolved spontaneously without reference to the central government of the colony. Hence every local authority owes its existence to imperial or colonial legislation; and the governor in council of each state of the commonwealth still possesses large powers of supervision and control over the local administration, which he exercises on the recommendation of the various departments of state. The urban local government areas consist of cities, towns, municipalities or boroughs; the rural of shires or districts.

Instructions sent in 1840 by the British government to the first lieutenant governor of New Zealand authorized him to divide the colony into districts, counties, hundreds, towns, townships and parishes, but this power was not utilized to any extent. Five years later the Public Roads and Works Ordinance enabled the settlers in any district to cooperate for purposes of local administration. The Municipal Corporations Act of 1867 permitted new districts to be incorporated on

the petition of one hundred ratepayers, if certain conditions relating to the area were fulfilled. The most important year in the history of local government in New Zealand was 1876, for the provinces were then abolished and the country was divided into sixty-three counties, all but six of which being placed under the control of an elected chairman and council. Another Municipal Corporations Act passed in the same year enabled all localities fulfilling specified requirements to be constituted boroughs. These enactments have long been repealed, but the broad structure of the present system is based upon them. A statute of 1882 authorized the formation within the counties of town districts, which are subject to the control of the county council.

In the East the most interesting phenomena in the sphere of local government are to be found in India. In ancient India the *Sabhā*, an essentially communal assembly restricted almost entirely to Brahmans, constituted the supreme governing body of the village; while the *Urār*, a territorial assembly less exclusive as to caste and creed, was carried to a further stage of development in the *Nāṭṭār*, or district assembly; there were still larger groupings of the same kind. Each city was administered by a body called *Nagarattār*, the assembly of the *nagara*, or city. The arts and crafts had their own vocational guilds, but for civic purposes there existed many composite and federal bodies in which Brahmans, artisans and merchants met together.

The most important survival of the traditional organization is the *panchayat*, or village council. The term *panchayat* denotes either a general meeting of the inhabitants or a select committee, a council of village elders, chosen from among them. The village communities have always had their staff of functionaries, such as the headman, who collects revenues, settles disputes and exercises general superintendence over the affairs of the village; the accountant; the watchman; the schoolmaster; and so forth. Some of these officers have become in British India the servants of the government rather than officers of the village community, and this may be one cause of the decline of the *panchayat*. In many of the half million or more villages of British India the inhabitants undertake for themselves the management of private schools, the maintenance of tanks and wells, the settlement of small disputes, the administration of village credit societies, the distribution of water in irrigated lands and other services which concern persons of all castes and creeds.

It was not until the middle of the nineteenth century that the elective principle was introduced in the presidency cities of Calcutta, Bombay and Madras. Between 1842 and 1862 municipal institutions were established by legislation in other towns, either at the option of the inhabitants or later at the instance of the provincial governments. As a result of the efforts of Lord Mayo in 1870 and of Lord Ripon in 1882 to further the participation of Indians in municipal administration there was passed a series of provincial acts providing for the election of a larger Indian element to the local authorities, and at the same time a pronounced impetus was given to the improvement of rural local government. The typical form consisted at first of a rural board exercising power over a large area; a proportion of the members were elected by the local taxpayers and the board was presided over by the district officer. The domination of the local board by this officer, who is the servant of the central government, proved a definite obstacle in the development of local government in any real sense. After the passing of the Government of India Act of 1919 new provincial legislatures were constituted on a more autonomous basis and local government affairs were transferred to ministers responsible to those legislatures. As a result the district officer was replaced on the rural board by an elective chairman.

The district board is now the most important unit in the country districts. It has an elective majority based on a franchise of 3.2 percent of the population. In Bombay and the United Provinces the Moslem electorates are provided with separate communal representation; while in other areas representation is secured for minorities by the provincial government's power of nomination. An attempt has been made within recent years to revive and strengthen the village *panchayats*, which in most provinces are now almost entirely elective. Local boards have also been set up in most provinces as subordinate agents of the rural board to administer parts of the district.

In Japan the reform of local government in the nineteenth century was connected as in Prussia and Russia with the abolition of feudalism. Prior to the Meiji era (1867-1912) there existed nothing in the way of municipal institutions. Each feudal clan had certain officials who carried on local administration, and the shogunate governed. Feudalism was abolished in 1871. The renaissance which occurred during the Meiji period resulted, so far as political affairs were

concerned, in the setting up of a strong central government. In 1873 there took place the establishment of the Department of Home Affairs, which has ever since exercised a dominant control over local government; this was followed by a movement directed toward the standardization of municipal institutions and toward the creation of somewhat more democratic forms of authority. Governors were placed in charge of the seaports (*fu*) and the former fiefs (*ken*), and a brief statement was issued by the central government as to the objects to be pursued by local administrators. In 1878 provincial assemblies intended to serve as forerunners to a national assembly were set up in the *fu* and *ken*. Two years later assemblies were established in the cities, towns and villages, into which the older regional areas had been reorganized and classified. It must be noted, however, that in Japan popular representatives have always occupied an advisory or consultative position and have never acquired positive power over the bureaucracy.

In China as in India there existed until very recent times that "aloofness of society from the state" which made it possible for the everyday life of the people to proceed relatively undisturbed by violent changes of government or by the rise and fall of dynasties. The emperor ruled, but he did not pretend to govern. Such government as has existed in China has been carried on in the city and village community. Judged by western standards, however, the Chinese are not accustomed to expect very much government except in the larger cities, although both the right and the opportunity of local self-government form essential parts of the Confucian philosophy.

The twenty-two vast provinces of the Chinese Empire were ruled by imperial governors or viceroys together with a few subordinate officials. The central government had in theory absolute power. In practise its activities consisted largely in controlling the appointment—although to only a small extent the subsequent action—of the officials occupying the higher provincial, prefectural and district posts; the holding of state examinations for the civil service; the collection of taxes and the maintenance of armies. At no time was the central control effective.

Each province was divided for administrative purposes into prefectures (*fu*) presided over by prefects, which were in turn divided into districts (*hsien*) in the charge of magistrates. The *hsien*, comprising a walled city—or in the case of many provincial capitals the half of a walled city—with the adjacent country, was the civic,

political, judicial and fiscal unit. The district magistrate in charge was assisted by treasurers, collectors, constables and other officials. The magistrate himself was the agent of the provincial and imperial governments for certain purposes and was personally responsible. He exercised control over every conceivable subject of local administration from famine relief to the care of temples.

The *hsien* commonly contained a large number of villages which had no legal or constitutional status whatever but which nevertheless exercised considerable powers of local government, carried out through the village elders on a patriarchal basis. An official (*tipao*) was nominated from among the elders to represent the villagers in relation to the *hsien* and other superior authorities. This system, built up through long ages under the Chinese monarchy, was left virtually untouched by the revolution which established the Chinese Republic in 1911.

The survey of the rise and in some cases the fall of local government in the main countries of the world indicates the difficulty of generalizing about phenomena so complex, so diverse, so rooted in the history, the stage of development, the political aptitude and the social characteristics of the various peoples. Two general conclusions, however, emerge as valid. First, local government is obviously the principal arena in which the conflicting principles of centralization and decentralization struggle for supremacy. Where the central government is essentially weak, no matter how absolute its theoretical or legal rights, local administration is bound to prosper, if for no other reason than that the practical needs of the people must be met. Second, every nation which has become a modern state has without exception been compelled during its transition to establish or to reform its institutions of local government.

The modern state is often faced during the course of its evolution with conflicting tendencies. On the one hand, the desire to strengthen the central power and to promote national ends rather than local interests frequently leads, as in France and Italy, to an extreme restriction of local autonomy and a development of the decentralized type of local administration through central officials. On the other hand, the vast increase in the scope of governmental functions makes central governments aware of the need to devolve both duties and responsibilities to local organs. This decentralizing tendency is often reenforced by a recognition of the vital edu-

cative effect on the people of representative local institutions. In England, India, Prussia, Japan, the United States and elsewhere the course of events has shown the impossibility of introducing or maintaining an effective and healthy system of democratic government in nation or state or province unless the larger organs of government are supported by healthy and democratic local councils.

An accurate gauge of the extent to which local autonomy prevails in a country is the degree to which local administration tends toward the decentralized or the deconcentrated type. It is here that a true distinction may be found between the local government systems of the English variety and those founded on the French or German model. In France the department is an area of both deconcentrated central administration and local government. The prefect is appointed by the government and is the local agent of all the central ministries; he is in fact the principal local servant of the central power. He exercises large powers of supervision over communes and mayors. He controls the police and appoints all the school teachers. The representative body of the department, the *conseil-général*, is relatively unimportant. In the commune the mayor serves in a double capacity. He is at once the agent of the central government and the executive head of the municipality. He is elected by the council from among their members, but he can be suspended by the prefect for one month or by the minister of the interior for three months or be dismissed by decree. The communal budget is proposed by the mayor and must be approved by the municipal council, but the final decision is with the prefect or in large towns with the minister of the interior. The prefect may insert additional items of expenditure in both the communal and the departmental budgets. The most striking illustration of the prefectural dominance is the power of the prefect to suspend the municipal council. Education in France is completely under the control of the national Ministry of Public Instruction; the upkeep of the main highways is also centralized.

The German conception of local government consists to a large extent in administration by a highly qualified professional officer checked by but essentially independent of an elective legislative or deliberative assembly and subject to its financial control. This contrasts sharply with the English system, where the fundamental principle consists in the supremacy of the elective

council and the complete subordination of the municipal officers to its decisions. Municipal administration in England is carried out by means of a series of committees of the council, each of which deals with a particular subject, such as education, public health and so forth, and the membership of which consists either wholly or mainly of councilors. In this way all members of the council, although unpaid laymen, participate in actual administration. In Great Britain again there is no deconcentrated control by the state. The supervision or control by the central government is carried out directly by the central ministries, and no local authority or municipal officer or mayor is the agent of the central power.

As regards central control England may be said to occupy a position midway between the authoritarianism of the French system and the extreme freedom enjoyed by American municipalities, especially in the home rule states. The relations between central and local government in England are complex. The central government exercises considerable influence and sometimes direct power through its ability to withhold national grants-in-aid of local expenditure; through the system of district audit of local accounts; and by such means as the approval of by-laws, the inspection of schools and police forces, the right to approve and modify local schemes for housing, town planning, hospital provision and so on. There is no absolute power of general control, however, except perhaps in the case of the poor law. In the United States the separate states have the constitutional right to regulate local government to any extent they desire. But in practise this right is exercised to a relatively small degree and local authorities are perhaps freer from superior control than in any other country. Even where subventions are paid by the state in aid of particular municipal services, such as education, inspection or supervision by the state does not commonly occur. The state is regarded as occupying an advisory rather than a supervisory position. The county, however, occupies a dual position in the United States not unlike that filled by certain areas of administration in Germany. It is at once a subdivision of the state for the enforcement of state laws and a district for the purposes of local administration. With comparatively few exceptions county officers are popularly elected. The principle of directly electing executive municipal officials is peculiar to the United States. It arises partly from a desire to separate

powers, partly from the theory of a system of checks and balances carried into the sphere of local government and partly from Jeffersonian ideas of democracy. Nevertheless, during the past two decades the rise of the city manager (*q.v.*) plan has been a most conspicuous feature of local government in the United States.

In Italy, which after its unification had adopted the main outlines of the French system, local autonomy has been almost entirely abolished by the Fascist regime. The responsible authority in each commune, except Rome and Naples, is the *podestà*, an unpaid officer appointed for five years by royal decree. The *podestà* exercises all the municipal functions which formerly devolved upon the mayor, the executive committee and the communal council. He is the only executive authority and appoints all the officers of the commune. His decisions are subject to the control of the provincial prefect.

In the larger communes the *podestà* is assisted by a council appointed by the prefect, two thirds of the members of which are selected from panels submitted by local syndicates and recognized economic organizations. The council is endowed with advisory powers only; it is summoned by the *podestà* at his discretion and expresses opinion on matters submitted to it by him; in regard to certain questions, however, such as the budget estimates, loans and taxation, the opinion of the council must be asked. If there is a difference of opinion between the *podestà* and the council, the *podestà* decides as he thinks fit. In the Italian provinces a system resembling the French prefectorial scheme is in existence, while in Rome a governor and in Naples a royal commissioner replaces the *podestà*. The governor is supported by a body of rectors appointed by the minister of the interior, each of whom is responsible for a specific branch of administration.

The various systems of local government may be divided into those in which general powers are conferred on the local unit and those in which only specific powers are granted. In France the communal council possesses legal power to embark on any activity considered desirable for the welfare of the locality, and in Germany a similar general power has been possessed by local authorities in most states since the days of the Prussian municipal code of 1853. In England, on the contrary, local authorities are permitted to perform only those functions which they have been expressly au-

thorized to perform by public or private act of Parliament, royal charter, statutory rule, provisional order or other legal document emanating from the king in Parliament or the central executive. This principle of confining the activities of local authorities to enumerated functions is judicially enforced by the legal doctrine of *ultra vires*. In the United States the municipalities in the home rule states have general powers within the limits set by the state constitutions; elsewhere the doctrine of *ultra vires* applies.

It is obvious that an accurate understanding of the powers possessed by local authorities can be gained only by considering the general context of central control exercised over local authorities. The constitutional freedom of the French commune is severely limited by the power of the prefect over finance, by the power to suspend the council and by other restrictive factors; while in Germany the reservation by the state of police functions and the requirement that local authorities must obtain state approval for many of their proposals circumscribe in practise the legal power of the municipal councils. It is worth noting that countries frequently change from one system to the other and sometimes apply both simultaneously. Thus the doctrine of *ultra vires* did not exist in England before the 1840's; Japan changed deliberately from the system of general to that of enumerated powers; while in Germany the powers of local authorities higher than the commune are specified in order to avoid conflict with the unlimited powers of the latter. But even allowing for all modifying influences, it may be asserted that in England, the United States, Australia, Canada and New Zealand reliance is placed on legislative and judicial control, whereas in France, Germany, Italy and Japan the emphasis is on administrative supervision by higher authorities. The private act of Parliament whereby the legislature confers powers on a particular locality has been extensively employed in England but appears to be unknown elsewhere. It is unconstitutional in the United States, although a state legislature can legislate for a "class" of local authority of which only one example exists within the jurisdiction.

The actual functions of local government are most varied. There are certain services, such as water supply, sanitation, poor relief, the upkeep of at least the minor roads, which are everywhere in the hands of local authorities. On the other hand, whereas education is a national service in

France, in the United States it is regarded as a peculiarly local function requiring special education authorities distinct from the general municipal bodies. Similarly, the control of the police force is a jealously guarded preserve of the English boroughs, while in Germany it is the concern of the state. Two distinct trends may, however, be emphasized. First, the scope of municipal activity has been greatly widened in recent times in regulating the conduct of citizens and more especially in the direction of providing services for the people, such as housing accommodation for the poorer classes, the operation of gas and electric supply utilities, the running of transport services and other forms of so-called municipal trading. In the second place, the growth of these and other services has had the effect of making local government far more important than central government in the daily life of the average citizen. The services which touch family and home life most intimately, such as the provision of health services, maternity and child welfare clinics, playgrounds and parks, general and technical education, the supply of water and gas and electricity, even the provision of the dwelling itself—these are tending more and more to be the affair of the local authority.

The interest shown by citizens in the work of the local council and the caliber of those who serve on it manifest wide variations. A very high point of excellence is reached in Switzerland, especially in the German cantons, where local self-government is perhaps more truly democratic than in any other country. In Germany and in England also, especially in the towns, civic feeling of a high order is to be found as well as in Holland and the Scandinavian countries. In the United States an exceptionally mobile population, a vast immigrant influx, a mixture of races and cultures and a great concentration on economic activity have proved, with a few notable exceptions, unfavorable to the development of any considerable popular interest in local government and this in turn has led to corruption in municipal politics.

The degree to which local democracy exists depends to no small extent on the effectiveness of the municipal organization, and this again is related to the constitutional structure. It is impossible to describe here all the variations in the size, shape and character of the areas of local government in the different countries of the world. Their irregularity and irrationality are conspicuous in an old country, such as England,

where the administrative divisions are to a large extent a heritage of past ages and where the determining factors are irrelevant to modern conditions. Their uniformity is most noticeable in new territory, such as the west and middle west of the United States, where the "congressional townships" consist of areas six miles square. But neither irregularity nor uniformity is the test of suitability. In nearly all the countries where extensive industrial development has taken or is taking place the areas of local government are proving too small for optimum efficiency. As a result of the technological revolution the areas of local government are often too small to include both the place of work and the place of residence of great masses of the population and have produced serious administrative and financial problems in such countries as Germany, France, England and the United States. At the same time new municipal services, such as town and country planning, public health functions calling for highly specialized experts and institutions and public utility undertakings requiring large scale operation, have created a similar demand for enlarged areas of jurisdiction. In nearly all the leading countries the areas of local government were determined before the advent of modern improvements in communication; and in none of them has there been any systematic attempt to bring the size and shape of the areas into accord with the trend of social and economic evolution. The result is that almost every country contains large numbers of local governing authorities whose areas are too small, too sparsely populated and too poor to respond adequately to the demands which are made upon them. The problem of areas is complicated by the dogged insistence with which ineffective local authorities claim the right to continue in existence.

Another phase of the problem of local government is the degree of simplicity which is to be found in the various systems. In the United States, Germany, England (outside the county boroughs) and elsewhere there are several layers or levels of administrative authority having jurisdiction over the same or overlapping local territory; whereas in Australia, for example, there is one and only one local authority in any area. The complexity resulting from overlapping local authorities tends to confuse the public mind and thereby to weaken public interest in municipal affairs; at the same time it diminishes the efficiency and economy with which local administration as a whole can be carried on.

The tendency toward increased central con-

trol, so marked at the present time, has sprung from several causes. The enlarged scope and importance of municipal functions have stimulated in central or state governments a sense of responsibility for their proper execution or at least their performance. The huge increase in municipal expenditures has made it necessary for grants or subventions to be made from national and state funds. The world wide economic depression and the acute financial situation existing in many countries have given the activities of local authorities in regard to poor relief and the promotion of public works a national importance which they never before possessed and which no central government can ignore. The inadequacy of many areas of local government has not infrequently compelled the intervention of the central government. For these and cognate reasons the power of the German *Reich* has increased in comparison with that of the municipalities and of the states; in England the central departments and especially the Ministry of Health have acquired a degree of control and influence over local authorities far in excess of any hitherto known; and even in the United States there is without doubt an extension in the power of the state governments over the local authorities.

Despite this tendency local authorities have greater opportunities today than ever before. If the powers of the central governments are increasing, so are the powers of the local councils. With the general extension in the scope of municipal government there is a growing recognition of the necessity for a well trained professional service to carry the burden of local administration. The elected councilor is ceasing to believe that he can govern wisely or efficiently without the aid of the expert official. Emphasis is therefore being placed in many countries on the need for improvement in the methods of recruitment, education, training, pay, status, conditions of service and ability of local government officers. At the Fifth International Congress of Local Authorities held in London in 1932 one of the two subjects tabled for discussion was the training of local government officials.

One of the most difficult problems of local government is presented by the administration of the great metropolitan areas. Attempts to solve this problem are being made in a number of countries, and plans are being put forward to obtain a more effectively unified type of metropolitan government by such means as the federation of existing bodies, the creation of larger units or the setting up of ad hoc bodies to deal

with particular services over the entire area. This question may serve as an interesting illustration of the way in which the same type of problem springs up in the field of local government in all countries which have reached approximately similar stages of economic and social development. The great diversity in the history and the character, the structure and the functions, of the various systems of local government is impressive, but equally so are the similarities of form and feature, of growth and decay and renewal, of problem and solution, to be observed among many unrelated sets of municipal institutions.

LOCALISM. See REGIONALISM.

LOCALIZATION OF INDUSTRY. See LOCALIZATION OF INDUSTRY.

LOCATION OF INDUSTRY. The location of industry is bound up with geography as well as with economics, for geographical differences affect the life of man, while man in turn reacts upon and changes the surface of the earth. As long as the forms of economic life remained simple, a descriptive study of territories and states, such as that of Montesquieu, was sufficient and political economy could ignore the problems of spatial separation and distribution. It was not until the advent of a free dynamic system of economic arrangements that such questions attained any appreciable theoretical

importance. Thünen could develop his theory of agricultural location, for example, only after the disappearance of the rigid three-field system of peasant economy. Industry too was for long almost as definitely restricted by historical factors. Throughout the mediaeval period handicraft was tolerated only in the towns. Home industries alone flourished in the rural districts, especially in mountainous regions where conditions for the development of agriculture were poor. In the mercantilistic period there were in addition direct attempts, particularly by Great Britain, to prevent the development in the colonies of manufactures other than those of local importance. These artificial limitations were superimposed upon natural obstacles to rational distribution of industry; in the North American colonies, for example, all industrial development was confined to the narrow coastal strip where the original settlement was concentrated. Complete freedom of movement for industry was effected everywhere at a rather late date. In Europe it was brought about by the abolition of the mediaeval economy, elsewhere by the collapse of the old colonial system. In new countries such as the United States the spread of settlements over the entire country was another prerequisite; only then was industry able, with the aid of the new technique of steam transportation, to exercise a free choice of location and to correct economic deficiencies in traditional locations.

Another reason for the neglect by early economists of the problems of location was their difficulty. It was not easy to integrate the differences of agricultural location into a causal explanation, and the variegated picture presented by industry was even more puzzling. While the question of the "natural" location of industry had been touched upon in passing by such writers as Sonnenfels and Büsch, the first broad treatment of the problem is found in Roscher's article, "Studien über die Naturgesetze, welche den zweckmässigen Standort der Industriezweige bestimmen" (in his *Ansichten der Volkswirtschaft aus dem geschichtlichen Standpunkte*, 2 vols., 3rd ed., Leipsic 1878, vol. ii, p. 1-100), which suffers, however, from the superficiality of theoretical discussion and the failure to synthesize the assembled mass of historical material. Roscher's analysis was supplemented in important particulars by the American E. A. Ross ("The Location of Industries" in *Quarterly Journal of Economics*, vol. x, 1895-96, p. 247-68) and by the Frenchman Maunier ("La dis-

tribution géographique des industries" in *Revue internationale de sociologie*, vol. xvi, 1908, p. 481-514). More important, however, was the fact that in the meantime the entire problem was approached quite differently by Launhardt in his mathematical study, "Die Bestimmung des zweckmässigsten Standortes einer gewerblichen Anlage" (in *Zeitschrift des Vereines deutscher Ingenieure*, vol. xxvi, 1882, cols. 105-16). Alfred Weber was the first to undertake to coordinate all these disparate efforts and to offer comprehensive treatment. The publication in 1909 of his *Reine Theorie des Standorts* gave rise to a theoretical discussion which has not yet abated and secured for the subject permanent importance in scientific literature. Although Weber never published the promised second part of his theory, which was to be "realistic," he edited a collection of studies of location of individual industries, and similar studies by other investigators followed. Weber's theory, unlike Thünen's, has not successfully met the test of subsequent criticism; it offered a powerful stimulus to further study rather than a definitive solution. It has been attacked from all angles, as by Engländer and particularly by Predöhl and Ritschl; but criticism has been constructive and has helped to clarify the outlines of a new and unified theory, in which there is no longer a distinction between the "pure" and the "realistic." These doctrines, moreover, were developed further in application to business economics and incorporated in practical economic disciplines. Especially in the United States, where the general theory has been developed but slightly, its implications have been reflected in studies of scientific marketing, such as W. Gerald Holmes' *Plant Location* (New York 1930).

While the doctrine of location has certain general aspects it is radically affected by an empirical distinction between those branches of production for which location can be chosen freely and those for which it is predetermined. In agriculture location is usually fixed; the factors of labor and capital must be adapted to the soil, and location governs production. In industry, on the other hand, location may be selected freely and land adapted to labor and capital; location is conditioned by the requirements of production. While it is important that the unity of the problem should not be overlooked, this basic difference renders inadvisable the formulation of a doctrine of location to apply uniformly to agriculture, industry and trade; attempts at the construction of such a unified

theory have generally failed. More specifically, the peculiarities of industrial location cannot be set forth clearly within the framework of a general theory.

The factors peculiar to industrial location, which are exceedingly numerous, are not always apparent, for the historical circumstances which have conditioned the location of the older industries are in many cases difficult to ascertain. Effective location factors are therefore most clearly indicated when industries move. Of these one group require only brief mention because they create in industry a situation similar to that in agriculture. The location of mining enterprises is the clearest illustration of their operation. Industries depending on water whether for power or for other purposes, as in the case of certain chemical, paper and leather manufactures, are in an analogous position. Similarly the presence of facilities for drainage, often more important than adequate water supply, and such characteristics of certain manufacturing operations as noise and odor may definitely fix location. While such restrictive factors could be omitted from consideration, the theory of location of industry must encompass all others, for each specific factor can be assigned its proper place only when the entire complex has been outlined.

The most important of the numerous factors which affect the free choice of industrial location is, as in Thünen's doctrine of agricultural location, orientation toward the market to which the output of the plant must be delivered. Transportation costs thus incurred are determined on the one hand by the weight and bulk of the products and the distance over which they are transported and on the other by the scale of freight rates. None of these determinants is fixed. Progress has been made in lowering the weight of the transported commodities, in shortening the distance separating the plant from the market and above all in reducing freight rates. So long as only natural traffic routes were available, natural conditions occasioned marked differences in freight rates, considerably equalized, however, by local taxes and dues. Even at present natural conditions exercise an important influence on transportation costs, particularly in the case of natural routes of great capacity, such as the sea, large lakes and long inland waterways developed for navigation. On the whole, however, the railroad has emancipated transportation from the limitations of natural routes and made equally accessible out-

lying points in every direction, a condition previously unknown. While it reduced the significance of transportation facilities as a location factor, it has introduced railroad rate policy as an important device for encouraging or impeding migrations of industry. The advent of the automobile in recent years has further increased the accessibility of distant points and reduced the importance of distinctive locations; at the same time the automobile has virtually eliminated the differences between the use of the railway and of the highway and impaired the effectiveness of railroad rate manipulation for location policy purposes.

Next to the market the factors of production constitute a most important consideration in industrial location, more vital in industry than in agriculture. Among these, however, land is not of outstanding significance. In industry, as contrasted with trade, land rent is of immediate practical concern only when an enterprise is to be established or extended. While a rise in rent may drive industries from central locations in large cities to the suburbs, as a rule it merely supplements a trend toward change of location due to other causes. The production factors, labor and capital, exert much more influence upon industrial location. The bearing of labor on location is very involved; one must consider the local wage rates, expenditures enforced by social legislation, the productivity of labor in its quantitative and qualitative aspects as well as its tractability. The factor of capital presents still greater complications. In the case of fixed capital, interest, like rent, is of importance mainly in the establishment of new or in the enlargement of old plants. Although differences in interest rates are often decisive for the introduction of an industry into a foreign country they do not constitute a permanent influence, for the tendency toward equalization of prices of articles entering international trade extends also to interest rates. Working capital, comprising raw materials, fuel and similar goods continually used up and replaced, is of much greater importance than fixed capital. In the literature of the subject fuels are usually classed with raw materials, but they are in fact much more subject to technological innovations. In this connection two major changes should be noted: first, the substitution of coal for wood and the consequent movement of industry toward the coal regions; second, the change now in progress, the substitution of electricity for steam. Since electricity is by now available almost

everywhere, the coal regions are largely ceasing to attract industry, a tendency which would be even more marked if coal were not also changing from a fuel to a raw material. The availability of power resources, which for long had been a prime consideration, is thus becoming almost negligible as a factor in location; this is perhaps the most far reaching change which has thus far taken place in the geographical distribution of industry.

Numerous factors of a non-economic character also affect location of industry. Of the geographic factors the most important is that of climate. Indeed Friedrich List regarded climate as the principal factor governing the distribution of industry; the temperate zone, he maintained, was the natural seat of machine industry, while the tropics were unsuited to manufacturing. Today it is known that man can lessen the effect of climatic differences; physical exertion entailed by work has been reduced, and tropical heat may now be mitigated with the aid of artificial ice and electric refrigeration. Furthermore natives of tropical countries have proved to be more educable than was formerly held possible. All sorts of industries, especially mines and iron foundries and textile manufactories using tropical fibers, have been established in the tropics. It cannot be denied, however, that while some climatic influences important in the industrial process, such as humidity, can be offset by artificial methods, climatic differences will always remain of consequence.

Racial differences, which are in part related to climate, are less important. The machine is becoming the common property of all peoples, and the handling of industrial apparatus has ceased to be the monopoly of a few nations; the old position of predominance is becoming confined more and more to the maintenance and improvement of equipment, although in this sphere the existing differences between peoples are insufficiently appreciated. National peculiarities of political organization also produce differences in institutional arrangements. Taxation, for example, is a factor affecting industrial location; where high taxes are not offset by corresponding advantages they cause eventually a shift in location.

In addition to these factors, which are beyond the power of any single individual, location is influenced by certain arbitrary choices. Inert obedience to custom, the all too human desire for comfort, the benefit expected from educational and recreational facilities, may override

the cold logic of strictly economic calculus. Again, for reasons of their own municipalities may attract industries by offering special privileges such as land grants or financial inducements. These are but instances of irregularities in location produced by arbitrary and accidental factors; their influence, however, tends to decline with the increasing displacement of private business by the corporation.

Once an enterprise has become established, the factors which influenced its location may lose their potency, although powerful forces of inertia may discourage change. The greater the fixed capital, for example, the more difficult is shift to other regions; in such a case a reduction in profits is usually considered the lesser of the two evils. Actual removals are thus rather infrequent, being caused usually by exhaustion of raw materials or by radical changes in the power economy. It is the new enterprises which usually become established in more favorable locations, thus pushing the older firms to the margin and bringing about their slow extinction. This is to be regarded as the normal type of industrial migration; it may of course be occasioned by changes in any of the factors which determine location, particularly the market, labor or raw materials.

Historically, industrial location with a view primarily to market proximity, which may be considered the original normal type of location, assumed two forms. The oldest and most widespread form applying to workshops dispensing rough artisan products was their distribution over a certain area paralleling the distribution of population. The other form of market orientation applied to the luxury trades which early sprang up alongside the ordinary crafts in upper class and aristocratic centers. All large cities, especially capitals, from antiquity to the beginning of modern times were centers of luxury industries, which were often promoted by the authorities. Only with the rise of the middle classes did the democratization of luxury consumption lead to shifts in location.

Later changes in location start from a condition of industrial localization caused by such twofold market orientation. Even where such orientation persists its influence is modified and there is a corresponding change in results. As improvements in transportation enable the individual producer to supply a larger share of consumption than is centered around the local market, the number of establishments in any single industry and with it the number of loca-

tions decrease. This process of concentration is accompanied by a differentiation between older countries and those which are still being settled. They differ not merely in the rate of development but in the phenomena attendant upon it; in the younger countries population grows largely by immigration, which creates new mass markets in the interior of the country, whereas in the older countries the natural increase in population is uniformly distributed and does not give rise to new centers of consumption. Only in foreign countries could a nation like Germany obtain new mass markets comparable to those which appeared in the western states of the United States. The influence on industrial location exercised by the domestic market is, however, quite different from that of a foreign market. The domestic market requires a central location from which all its sections can easily be reached; the foreign market, on the other hand, attracts industries to the periphery of the country, especially when ocean transportation is available. Such a distinction is of slight importance for England, where the distance to the seacoast from any inland point is so short that even domestic commerce can often take advantage of cheap coastal shipping. Nor does the conflicting influence of the domestic and foreign markets assume practical importance until a country has developed a large export trade. In the United States, for example, the antagonism remained latent, but where it became manifest it was acute because of the enormous distances involved. This situation led the Standard Oil combination to adapt its organization to a dual market attraction by establishing two great distribution centers, one on the Atlantic coast near New York, the other in the center of the continent near Chicago. In Germany, with its much smaller area, similar developments appear only in isolated instances, as in the iron and steel industry. It is much more typical that before the World War German foreign markets tended increasingly to attract large scale industries to the seacoast and the shores of the Rhine.

Orientation toward the domestic market predominates wherever settlement is still in process. For a long time this fact accounted for the most characteristic peculiarity of industrial development in the United States. With the exception of a few branches which could serve an unusually large marketing area, industry followed population westward. This shift, however, did not constitute an industrial migration in the

proper sense of the term unless other location factors were involved. In the east plants were not dismantled; industry expanded merely in the measure dictated by the increase of population. The general westward movement has recently subsided, if it has not ceased altogether. In so far as the movement of industry is an aspect of the migration of population it was brought to a standstill by the post-war restriction of immigration. Another factor was the opening of the Panama Canal in 1914, which established closer economic ties between the east and the west coast than those which exist between the Pacific coast and the middle west. The operation of the Panama Canal and the realignment of rates since the war have resulted, for example, in moving Chicago away from the Pacific coast on the average about \$3.36 per ton of staple goods, while moving New York \$2.24 nearer. Every place east of a line passing approximately through Cleveland has been afforded preferential treatment in reaching the Pacific coast through the new ocean route. The further growth of the middle west is now impeded by both of these factors; in fact movement out of this region is becoming noticeable here and there.

The labor factor may affect choice of location in many ways. Since labor is divided into a great many groups, the interchangeability of which for the purposes of a particular industry is rather limited, location with reference to the labor market is possible only if all the requisite labor groups are present; hence the larger the labor market the easier is the orientation toward labor, and this despite the fact that in large cities wage rates are as a rule higher than in small towns. Wage rates alone are never the deciding consideration. To wages must be added expenditures for labor welfare, more readily ascertainable in those countries where they are made compulsory by law. Such costs are usually reflected in a higher quality of labor performance, which, however, is not easy to evaluate; where the balance between the two lies is just as difficult to ascertain as it is to carry out a comparison between labor cost and labor service. This problem loses practical significance as the cost factor, capital, becomes increasingly important and the employer is forced to value continuity of labor more highly than its cheapness. When the threat of a strike involves a risk so much heavier than the difference of a few points in wage scales, it pays to purchase labor tractability with higher wages. Of late the search

for tractable labor has induced perhaps as many shifts in location as the quest for low paid labor.

Yet there are instances of industrial location which may be described as wage minimum and productivity maximum types. Manufacturers of coarse cotton fabrics have in recent years tried more persistently than ever to locate their plants in wage minimum areas and have caused perhaps the greatest international industrial migration of modern times. Cotton manufacturing has shifted from areas of high productivity and high wages, such as Lancashire and eastern Massachusetts, to industrially backward regions like Japan, India and China, and in lesser degree to the southern states of the United States. In these areas success depends wholly upon the outcome of the race between rising labor cost and growing labor productivity; education and trade union organization have a vital effect upon the outcome, and the results are often subject to wide fluctuation. On the other hand, long established industrial centers, such as Birmingham, Essen and Pittsburgh, attract industry as productivity maximum areas. By virtue of their age and tradition they have developed labor of high qualification, which has increased the drawing power of labor as a location factor. As they developed into quality industries many lines of manufacturing, which at first located more or less by chance, shifted to such centers of high labor qualification, thereby acquiring a rational location.

Location with primary reference to the labor factor derives as a rule from two fundamental conditions. The first is that the proportion of labor costs in the total cost of the product must be high enough to give the labor factor a weight greater than that of working capital and of market; orientation toward labor requires at least that the saving in labor costs exceed the possible saving in transportation costs. This relation brings out certain differences between industries which are traceable to the weight of the raw materials used and which are therefore apt to persist; thus is explained the contrast between cotton manufacturing, in which the labor orientation has always predominated, and the iron industry, subject to much greater pressure of the transportation costs for raw materials. For industry as a whole the widespread decline in the relative importance of labor costs tends to decrease the influence of the labor factor upon location. Formerly it could properly be argued that since the proportion of labor costs rises

as the product approaches the finished stage, the labor orientation ought to manifest itself most clearly in those national economies which are dominated by the manufacture of consumers' goods. At present, however, this is no longer true, because it is just in these industries that capital costs have been gaining in importance at the expense of labor costs. Nowadays local differences in the cost of labor must be very large indeed to induce even a gradual shift in the location of an industry. In fact with the ever increasing "capitalization" of industry as a whole the basis for labor orientation becomes more and more narrowly restricted to preserving continuity of operations and hence to securing tractable labor.

The second condition for a labor orientation is that labor itself be bound to a given locality. This is not always the case. Even in the earlier stages of development labor is not always rooted to the soil. Slaves have always possessed a high degree of mobility. At present Hindu and Chinese coolies are exported to any part of the Pacific and Indian Ocean regions when a new demand for labor arises; and African labor is transported over long distances for work in South Africa and Katanga. In European countries law and tradition have tended to bind labor to its native soil. Among the European workers two major classes have influenced the location of industries. First there is the class of craftsmen, deriving from mediaeval handicraft and the old domestic system, who for many generations have specialized in certain types of work and in many cases have monopolized certain skills. The second is the working population of modern large cities; this group, deriving largely from the more intelligent and enterprising portion of the rural population, has developed a character of its own, having acquired an understanding of technical matters and a faculty for adaptation to changing tasks. For a long period such labor attracted industry. There were, however, notable exceptions; thus the chemical and iron plants built up at Leverkusen and Rheinhhausen in Germany have drawn their labor from the outside. Of late there have been indications of a general trend toward greater mobility, especially among the skilled workers.

In colonized countries labor always enjoys considerable mobility. Immigration extends into internal migration, and local sentiment develops but slowly. Under such circumstances it is unnecessary for industry to choose location on the basis of labor availability; labor may be

counted upon to be attracted to the industry. For this reason factories can be located in sparsely settled regions of the United States much more easily than in undeveloped sections of Europe, and it is natural enough that labor orientation should have been much less important there than in Europe. Exception must be made, however, for the New England states, the area of oldest settlement, where long established industries are now located largely on the principle of labor orientation. Another exception of more recent origin is the location of the cotton industry and still later of the rayon industry in the south; here the motivation is the availability of "poor white" labor. But such exceptions are mainly survivals from the past. Mobility, both physical and mental, is on the increase. The process of deracination begun by the railroad is now rapidly being completed by the automobile; attachment to the native hearth dating from the days of the town economy is being displaced by the much weaker feeling of love for one's country; and economic advantage tends increasingly to outweigh all other considerations. The growing mobility of labor, just as the decline in relative labor cost, indicates the diminishing importance of labor as a factor in industrial location.

Mining excepted, the location of industry with primary reference to the raw material factor occurs only if two conditions are fulfilled. One of them, discussed above in connection with labor, is that the saving in the cost of raw material due to such location must exceed the saving in the cost of labor were a labor orientation followed. This usually occurs when raw materials constitute a larger share of final cost than labor, and—since raw materials cost is composed of the price paid in the market, which is likely to be the same whichever market is patronized, and the price of transportation from the market, which depends on the location of the plant—orientation toward raw materials must be the more important the greater the cost of transportation, that is, the heavier and bulkier the raw materials are. For this reason the location of heavy industry is more likely to be conditioned by the factor of raw materials while that of the garment and textile industries tends to be influenced by the labor factor.

The second condition for orientation toward raw materials is that the savings in transportation costs for the raw materials must exceed savings for the finished product in case of a market orientation; this in turn depends upon

how much of the weight of the raw materials enters into the finished product. Thus the less the difference in weight between the two, the more location for market tends to supplant location for raw materials, even though railroad freight rates are usually higher for finished goods. In the cotton industry, where the difference in weight is slight, proximity to the finished goods markets is of primary importance, unless, as is usually the case, a labor orientation predominates. On the other hand, industries using heavy raw materials tend to be dominated by the raw materials orientation; besides the iron and steel industry, this is characteristic also of many branches of the chemical industry and of the glass, sugar and packing industries. Tobacco, rubber, oil and linoleum industries which use imported raw materials may be said to conform to this rule when they locate near the principal importing centers.

Rational location oriented toward raw materials is often difficult when an industry requires several important raw materials from widely separated regions. In such cases the most advantageous location is readily ascertainable only if the possible saving for one raw material is greater than that for all the others, and raw materials orientation prevails only under special conditions, such as those obtaining in the iron and steel industry, where both the important raw materials, ore and coke, lose much of their weight in the course of production. One of the great initial advantages of the English iron industry was that iron ore and coal were mined in close proximity to each other, so that the transportation charge was exceptionally low, less than one third of the expense of transportation for the German industry; today, however, English iron ore is practically exhausted, and this competitive advantage has disappeared. In the countries which are England's major competitors the ore mines and the coal mines are hundreds of miles apart. There the solution of the problem as to which raw material determines location depends largely upon one factor alone—the iron content of the ore; thus if the content is reduced 50 percent proximity to the ore mines becomes doubly important. Also in the United States at the present time the production of iron involves the use of about twice the weight of iron ore as of coke, and for this reason it has now become possible to effect a greater saving in raw material by shifting the iron and steel industry from the coal regions to the ore fields; the American iron and steel in-

dustry has migrated from Pittsburgh, first to Lackawanna on Lake Erie, then to Gary on Lake Michigan and finally to Carnegie in the ore area at the head of Lake Superior. The movement of the German iron and steel industry from the coal fields of the Ruhr toward the iron ore deposits in Lorraine and Luxemburg was disastrous to Germany, since the newest and best iron works were thus located in the regions which it forfeited as an outcome of the World War.

In general, since the useful content of mined raw materials is decreasing as exploitation proceeds, there is a tendency for industries dependent upon such supplies to seek location nearer the mines. This tendency is, however, counteracted by increasing emphasis on the utilization of by-products, which reduces the difference in weight between the raw materials and the products. The general trend toward location for finished products is thus competing with the somewhat limited trend toward location for raw materials, but this competition is for obvious reasons less effective than in the case of orientation toward labor. This intensification of the finished products orientation, involving on the whole an equalization of existing local differences, must be regarded as one of the most characteristic and widespread recent developments.

It will be appreciated that the theory of location, involving as it does a new problem and a new approach, was not readily assimilated into economics. Its advocates tended at first to interpret it too broadly, and to claim for it independent status. Thus an attempt was made to subsume all problems of "agglomeration" under location theory. While any locational factor may have an agglomerative effect, since its influence is not limited to single enterprises, it is equally true that many factors tending toward industrial concentration have nothing to do with the problem of location, as is evident from a consideration of the causes of large scale production and of the related problems of vertical combination. In the interests of the theory of location such distinctions should be clearly made. At the same time, it must be recognized that agglomeration can in itself become a locational factor, in so far as it creates advantages of personal contact between the technical and business personnel of different enterprises and industries.

More difficult is the question as to how the new theory of location, which up to a certain point applies equally to agriculture, industry

and trade, fits into general economic theory. Thünen had no doubts upon the subject; he started with the theory of prices and attempted to determine the importance of spatial distances to any price theory. It was not clearly perceived that industrial location could be considered from the same standpoint; nor is it generally realized today that the theory of location is essentially a problem of local differences in price formation. In the last analysis, however, the theory of location is an organic part of the general price theory, and as such has some application to all the different branches of economics, especially to those in which spatial separation and local differences are of importance. Thus it has a bearing on the theory of the distribution of the means of production and intrenches in ways not always clearly recognized on all problems of industrial expansion and contraction. It has made it possible to differentiate new forms of rent, and it is basic to the theory of transportation; it adds fulness to the general theory of division of labor, imparting a scientific character to discussions of international division of labor, so that it has even been termed the core of the theory of world economy.

Finally, the theory of location is related to the doctrine of stages of economic evolution, as Maunier pointed out in 1908 and as Ritschl has shown more recently. In so far as that doctrine is a theory of marketing it is of fundamental importance for the problem of location. Where there is no market, as in Bücher's self-sufficient natural economy, neither the price problem nor the problem of location exists. The latter arose only in the town economy with the origin of the market, but was unimportant because the town market was narrow. The transition to a national market was accompanied by a struggle between cities and new nation states which revolved in large part about questions of industrial location. A previously unknown process of relocation, which began with the shift of handicrafts to rural localities and the concentration of some industries in certain areas, gained in scope and intensity with the advent of steam. It was repeated on a larger scale with the development of world economy, when shifts in location became international in character. Through his theory of the unsuitability of the tropics for industrial production List was the first to endeavor to give content to the accepted notion that industries migrated to the locations which were most advantageous

for each country as well as for humanity in general. But only with the formulation of the theory of location has a more profound and correct idea of the process of international division of labor come to prevail. Not industrial specialization but, in Weber's words, "the uniform distribution of production over the area" is now looked upon as normal and basic for the world economy as well as for the national economies. Agricultural production, which today is spread over the world in wide rings, to follow Thünen's figure, gives rise in the first place to an industry oriented toward agriculture. Such industry at first does little but the primary processing of raw materials, and only gradually undertakes also their manufacture. As a rule governmental needs, especially military requirements, have provided the initial impetus toward higher industrial development. With the rise of the world market the tendencies which dominated the growth of the national market are reproduced on an international scale. Industry is once more deflected to backward regions and local concentration effects a reduction in the number of industrial locations. A national economy, however, is better able to defend itself against the encroachment of wider markets than was the town economy. It freely employs the weapon of railroad rates, but utilizes as its chief instrument the tariff, which is directed at the equalization of foreign locational advantages. The growth of the world market is therefore a slower process than was the transition to a national market. As the earlier process it involves nullification or mitigation of the economic effects of local differences. For a time England was "the workshop of the world," but at present an "international decentralization" is in progress, assisted in large part by the increasing substitution for coal of fuels which are much easier to transport. The process, however, is still far from complete; the problems of the international location of industry are likely to dominate the economic development of all nations for a long time to come.

LOCH, CHARLES STEWART (1849-1923), English social worker. In 1875, six years after the founding of the Charity Organization Society of London, Loch became its secretary, and during some forty years of tenure he was the chief exponent and interpreter of the charity organization movement. He was indefatigable as lecturer, writer and organizer. Although his activities were restricted to England, his writings brought him international recognition. His in-

fluence was particularly strong in the United States, where the pattern of urban life proved highly favorable for the expansion of the movement. Spiritual heir of Thomas Chalmers, Edward Denison and Octavia Hill, Loch championed the theory of social case work and the need for coordinating all community agencies, public and private, in the treatment of the poor. Like others of his school of thought he attributed much of the "pauperization" of the poor to the evils of the English poor law system and became an ardent opponent of governmental relief schemes. He was therefore chary of social insurance as favoring mass rather than individual treatment and as leading to the deterioration of the moral fiber of the poor. His influence may be seen in the militant opposition of the Charity Organization Society of London to the unemployment insurance system as it developed in the years following the World War; it can be seen also in the opposition of many social workers in the United States in the period before and immediately after the war to mothers' pensions and in the specious use of the concept of "doles" by opponents of public relief in the United States.

While his devotion to social case work was the central interest in his life, Loch was active in promoting larger measures of public welfare. He introduced hospital social service in England, was responsible for the appointment of the royal commission on the care of the feeble-minded, was interested in housing reforms and labored assiduously as a member of the Poor Law Commission of 1905 to 1909. In 1915 he was knighted for his services.

LOCKE, JOHN (1632-1704), English philosopher. Locke's training and practise in medicine and his constant employment in public affairs together with a naturally matter of fact bent of mind encouraged him to remain in all his inquiries primarily a conscientious and close observer of the facts, a characteristic which preeminently fitted him to be the founder of the school of British empiricism. He had little learning but "raised common-sense to the point at which it becomes luminous." He marked an

epoch in modern philosophy by undertaking the first really critical inquiry into the competence and range of the intellectual powers of man (*Essay concerning Human Understanding*, London 1690; reprinted Cambridge, Mass. 1931). His method was psychological in the sense that he relied entirely on looking into his own mind to determine both the nature and structure of its experience. But he did not use his own method rigorously or press his resulting doctrines to their logical conclusion. He sought to vindicate the achievements of modern science by teaching that all knowledge comes from experience, i.e. that it is derived from the senses, rejecting equally the scholastic doctrine that the first principles of knowledge rest upon authority and the Cartesian view that they are innate. But while all knowledge is derived from the same source, he maintained that our knowledge of physical nature falls short, in respect of certainty, of our apprehension of mathematics and of morals. This is due to a limitation of the human intellect which can never be transcended; but our powers are as great as is necessary for us to secure our happiness, beyond which we have no concern. This theory that knowledge is wholly derived from sense perception has commonly been held to issue inevitably in the skepticism of Hume; but because of his statement of the problem Locke has received credit also as the great forerunner of Kant and the "critical philosophy."

In his political writings also (*Two Treatises concerning Government*, London 1690; reprinted 1924) Locke's inquiry following his empirical method was governed by an urgent awareness of the facts and showed outstanding judgment and common sense rather than logical system. His second *Treatise of Civil Government* was admittedly a philosophical defense of the principles of the Revolution of 1688; and not only his doctrine but many of his phrases found their place in the American Declaration of Independence. First and last he was a defender of individual liberty whether against pope or king, against religious persecution (*Epistola de tolerantia*, tr. by W. Popple, London 1689, 2nd rev. ed. 1690; followed by two additional *Letters concerning Toleration*, 1690 and 1692) or literary censorship. It was from this point of view that he maintained that sovereignty resides in the will of the people and that governments are simply trustees for those ends to secure which men had in the past actually contracted themselves into society. When the government fails as trustee its removal by the people is not rebellion or the

dissolution of the state, as Hobbes had maintained, but the legitimate exercise of the power of the sovereign. In his advocacy of popular sovereignty he showed neither the rigorous logic nor the impractical extravagance of Rousseau; but he discerned the essential principles of the political advance actually achieved in his time and drove them home in terms which have to a remarkable extent fixed once for all the language of English democratic theory. His celebrated doctrine that the right of property ultimately depends upon labor alone had some influence on Adam Smith and subsequent economists and is still an operative force in determining the course of judicial review of the regulation of business in the United States.

As is seen from his *Journal* Locke was always an acute observer of economic facts. His main theoretic writings in this field are about currency, and with Newton he was called into counsel before the reform of the English currency in 1695. He displayed effectively the fallacy in the device of depreciating the currency and taught unequivocally that silver and gold are simply commodities not differing intrinsically from other commodities. He showed that the rate of interest cannot be fixed by law, although with characteristic inconsistency he favored the fixing of an upper limit above the current rate. He saw that it was not possible to stabilize the relative value of gold and silver and was himself a silver monometallist. He did not see, however, the fallacy in the view that the prosperity of a country is dependent on a favorable balance of trade, being so far a mercantilist as to hold that national wealth depends upon the holding of gold and silver. Still it would be difficult to find any previous or contemporary writer who was as important in the development of economic science as Locke. In fiscal science he is noteworthy chiefly for having originated the doctrine that all taxes finally rest on the land.

Locke was a severe critic of current methods of education in almost every particular (*Some Thoughts concerning Education*, London 1693; reprinted Cambridge, Eng. 1922). He regarded virtuous habits, practical wisdom and "good breeding," in that order, as the chief aims of sound education; last in importance came the inculcation of knowledge. In place of the customary concentration on Latin and Greek he advocated, perhaps overoptimistically, a somewhat exacting program covering the whole field of human knowledge as well as considerable training in athletics and practise in a manual trade

All learning by rote he rejected; right reasoning he held to be best acquired by studying good models and by the pursuit of mathematics. He condemned the exploitation of the motive of fear in inducing the young to study and felt that appeal should be made rather to the pupil's natural desire of employment and learning and his propensity to imitation. Thus it is not surprising that Locke was an uncompromising critic of the schools and advocated private tuition.

LOCKOUT. *See* STRIKES AND LOCKOUTS.

LOCKWOOD, BELVA ANN BENNETT (1830-1917), American lawyer and reformer. Widowed at the age of twenty-three and with a child to support, she entered college in a period when higher education was rare among women, taught school for several years and then took up the study of law. In 1873 she was admitted to the bar in Washington, D. C. Refused the right to practise before the Supreme Court of the United States, she drafted and secured the passage in 1879 of a law opening that court to women and

was herself the first woman lawyer to be admitted under its terms. She was also responsible for the law giving women employees of the government equal pay with men for the same work. In 1884 and again in 1888 she was the candidate of the Equal Rights Party for president of the United States. Among the other movements in which she was actively interested were peace, temperance and woman suffrage. She was a delegate of the Universal Peace Union to the various international peace congresses held in Paris, London and Rome, and in 1896 she was commissioned by the secretary of state to represent the United States at the Geneva Congress of Charities and Corrections. She was for several years interested in the territorial encroachment claims of the Cherokee Indians and as attorney for them was largely responsible for obtaining a judgment of \$5,000,000 against the government.

In addition to her reputation as a pioneer woman lawyer and suffragist Mrs. Lockwood was widely renowned as a lecturer. She was the author of numerous brochures on arbitration, disarmament and women's rights.

LAURA M. BERRIEN

Consult: Willard, F. E., and Livermore, M. A., *American Women*, 2 vols. (New York 1897) vol. ii, p. 468-70.

LODGING HOUSES are generally defined as institutions for the provision at low rates of temporary shelter for casual or transient workers. In England and in some parts of the United States, however, the term lodging house is also applied to rooming houses catering to low paid but regularly employed workers, who having migrated from the country to the large commercial and industrial centers have become detached from the family group.

The origin of the lodging house in the narrower sense of the term dates from the beginning of large scale labor transiency. Prior to the industrial revolution there were movements of "homeless" wandering workers to centers of trade and navigation; and in periods of war and famine transiency naturally increased. With the industrial revolution, however, attended as it was by growth of urbanization and concentration of industrial activity, the existing boarding and rooming houses which had provided shelter for the detached non-transient worker were unable to meet the increasing demands of migratory and seasonal workers for a cheap night's lodging. The onrush of industrialization created a serious housing shortage for all workers, which was inadequately solved in the case of families by the

construction of tenement dwellings; the appearance of floating unskilled or unemployed laboring groups was part of the same process and contributed a special problem of housing.

Like the lodging house, the boarding house, rooming house, "flop" house and "bunk" house serve for the worker without a family as a substitute for the home. The boarding house, perhaps the generic antecedent of all types, is most generally found in districts where the demand does not justify the lodging house. Boarding houses are of two kinds: the first is the large company type and the second the small, intimate home type. Houses of the former type are more usual in localities where rapid development of business activity attracts numbers of transient laborers. They may cater to sailors, to factory workers or to certain national or racial groups. As urbanization of such districts sets in, this kind of boarding house yields its food service to the restaurant and its shelter service to the lodging house. In England a peculiar feature of the company boarding house was the custom known as living in which prevailed until the early part of the present century; owners of commercial or industrial enterprises provided for their employees living quarters in which residence was usually compulsory. This was one of the few forms of company house in which women resided. The abuses to which it gave rise with respect to conditions of employment, freedom of movement and provision of decent accommodation led to its extinction. The second type, or home boarding house, serves both male and female workers who are of a higher social and economic class and whose occupations are usually more regular and more skilled than those of the first group. With its common dining room, its common parlor and its landlady this institution is better adapted to the quiet residential community. Urbanization also tends to eliminate this species of boarding house.

The rooming house, which frequently permits light housekeeping, usually caters to the same social and economic class as does the home boarding house. While the latter supplies in many respects a home environment, the rooming house because of its lack of social life is often conducive to vice.

A flop house is a lodging house of the dormitory type but with much lower prices than other lodging places. The better grade of flop house provides bed and bedding; there is a lower grade which provides only the bare bunks or chairs, and the lowest permits men for a pittance to sleep on the floor. In some European and Asiatic cities

it is possible to engage sleeping space with or without bedding.

The bunk house is a combination lodging and boarding establishment, sometimes supplemented by a commissary department, which serves transient homeless workers in places remote from the urban center. It is found on railroad or construction jobs, in lumbering or mining camps or on large plantations. Here the men may live in tents, barracks, box cars or, as in the diamond fields of South Africa, in large closed compounds. The food and lodging service may be managed by the employing company or may be contracted for by commissary and boarding companies. The commercial boarding house tends to replace the bunk house wherever the population increases sufficiently to make it profitable.

A type of public shelter extensively used in Europe is the farm colony, which was created with the double purpose of ridding the cities of unemployable and vagrant persons and of providing labor for land cultivation. It may be a place for either enforced detention or voluntary commitment; in seasons of unemployment it serves as a lodging house for the homeless unemployed. An auxiliary to the municipal lodging house, it has sometimes lapsed from its original function of rehabilitation into a means of caring for the pauper class which overburdens the city asylums. The most successful European farm colonies are found in Germany, although they have been established in other countries, notably France, Belgium, Switzerland and the Soviet Union. In the United States private agencies have made unsuccessful attempts to maintain such colonies.

In the evolution of lodging houses proper two general classes have developed. The earliest of these, still most numerous, is the commercial lodging house. The second class includes lodging houses operated by public and private charity, either free or at cost, but all organized for social purposes. The latter are usually maintained in an attempt to overcome the deficiencies of commercial lodging houses. Laws and regulations imposed on the commercial houses apply, however, with equal force to the charitable lodges. By legal definitions or court decisions lodging houses have been distinguished from hotels, sometimes on the basis of the fees charged but usually on grounds of internal structure. A lodging house may be a dormitory, but more often the beds are separated by dwarfed partitions which do not reach the ceiling, thus forming

tiny rooms known in the United States and in England as cubicles and in France as *chambrettes*. Other characteristics of the lodging house are the segregation of the sexes and the preponderance of men; in Europe there are occasional lodging houses which shelter migrant families. While as a general rule meals are not served, lodging houses in some countries do provide communal kitchens where occupants are permitted to do their own cooking. A further feature which distinguishes the lodging house from the hotel and which has grown out of its function as a cheap and temporary form of accommodation is its right to refuse shelter to undesirable applicants.

The commercial lodging houses which sprang up in all industrial countries in the first half of the nineteenth century gave rise to the abuses which usually occur when the care of socially dependent groups is left to private initiative. Not only were the accommodations inadequate and even injurious to the health of the patrons, but vice and crime were often encouraged and saloons and gambling halls established. Moreover these houses were often exploited by corrupt politicians who used them to establish fictitious residences for "floaters." Concurrently with the commercial undertakings charitable and semicharitable lodging houses were initiated by various religious and evangelistic organizations. Some of these early agencies still exist; the Seamen's Church Institute of New York founded in 1843 has recently added an extensive social program to its original activities, and various small shelters are maintained by evangelistic missions in every large city. Later private charitable shelters were established by social welfare agencies which aimed to provide an opportunity for men to escape the demoralizing influences of the commercial lodging houses or to threaten these houses with competition in order to force them to raise their standards of accommodation. Some of the later houses, like that established in New York City in 1885 by the Sanitary Aid Society or the New York Wayfarers' Lodge, which opened in 1893, were model demonstrations designed to interest the municipality in establishing a public lodging house. The outstanding examples of the modern socio-religious lodge are those of the Salvation Army, which since about 1890 has established shelters at cost fees in most large cities of the world. The most prominent and the earliest lodging houses for men established on a non-religious basis are the Rowton houses in England founded in 1892. Similar institutions are the three Mills hotels in New York City and

the Rufus F. Dawes Hotel in Chicago. These constitute a hotel type of lodge operated on a non-profit basis. A sufficient charge is made to insure maintenance and in some cases to provide a small surplus for further development.

At present there are municipal lodging houses in most cities of the world. One of the earliest and most extensive was established at Berlin in 1887. The refuge at Paris was founded in 1889, that at London in 1893 and the Municipal Lodging House of New York City in 1896. In every case these large public lodging houses were preceded by considerable effort of an experimental nature on the part of privately endowed agencies. In the United States the major objective of these agencies was to persuade the municipalities to establish public shelters and to discontinue the practise of lodging homeless persons in police stations and county jails.

Lodging house patrons are drawn chiefly from the older age groups of the community; the median age varies from forty to fifty years. As a class the group rarely rises above the minimum subsistence level. It is usually the first to be affected by unemployment and the last to be relieved by a lively labor market. Because of the element of selection the number of people sheltered in lodging houses cannot be considered an accurate index of unemployment, but it does indicate the effect of depression on the lowest paid working group.

The patronage of the lodging house is, however, by no means restricted to the casual or migrant labor groups, and it is in connection with its mixed character that problems of social control arise. It includes every manner of derelict not found in public or private institutions—criminal, pauper, beggar, prostitute and mental defective—and the opportunities for the breeding of crime and the formation of vagrant habits are plentiful. The regulation of lodging houses by public authorities, which began in England in 1851 and was followed in other countries toward the end of the century, aimed mainly at control of the behavior of lodgers; in fact lodging houses were often put under the surveillance of the police. But the later activity of social and religious agencies in providing decent temporary shelter gave rise to a new form of control—the regulation of sanitary conditions in lodging houses. It has therefore become the practise to entrust departments of health or welfare with the supervision of lodging houses; thus the lodging house population in the best regulated cities has come to be a quasi-institutionalized class.

Sanitary regulations consist chiefly of minimum requirements for light, air space, ventilation and safety from fire. Although such laws exist in practically every state and city, requirements are not easily enforced; even honest officials find it difficult to enforce regulations concerning the conduct rather than the construction of the house.

LOEWENSTEIN, ALFRED (1877-1928), Belgian financier. The son of a Brussels stockbroker, Loewenstein engaged in financial affairs from an early age. About 1905 he became connected with the Pearson-Farquar group, which was engaged in the development of electrical industries, especially in South America. He led in introducing into Belgium such securities as Rio de Janeiro Tramway Light and Power, Brazilian Traction Light and Power and Barcelona Traction Light and Power, legally Canadian corporations. All of them became objects of large scale speculation on European exchanges. These operations laid the basis of his very large personal fortune. After the World War Loewenstein extended the field of his activity, apparently envisaging a great international electrical

trust; in 1923 he organized the Société Internationale d'Énergie Hydro-Électrique, a holding company principally for "Canadian" securities. The Sofina benefited from his subsequent dismissal. In 1926 he created the Hydro-Electric Securities Corporation, a holding body for North and South American electrical stock incorporated in Montreal. He was interested also in the artificial silk industry and tried to secure control of British Celanese, Ltd.; he created the International Holding and Investment Company with important interests in several large European companies. He organized other minor holding companies and in 1928 he tried unsuccessfully to secure control of the Banque de Bruxelles.

Although Loewenstein's contribution to the European popularity of its securities aided in developing South America, his celebrity was not based on the social value of his work but on the immensity of his fortune, his extraordinary ostentation and his flair for publicity. Exclusively a financier, he regarded the industrial and productive aspects of business as objects of financial combinations and stock manipulation. His activity helped to aggravate economic instability and irregularity, while his extravagance aided in discrediting capitalists and the capitalist regime. He died by falling from an airplane into the North Sea.

LOGIC. The conditions under which logical theory originated are indicated by the two words still generally used to designate its subject matter—logic and dialectic. Both of these words have to do with speech, not of course with speech in the form of mere words but with language as the storehouse of the ideas and beliefs which form the culture of a people. Greek life was peculiarly characterized by the importance attached to discussion. Debate and discussion were marked by freedom from restrictions imposed by priestly power and were emphasized with the growth of democratic political institutions. In the Homeric poems the man skilled in words which were fit for counsel stands side by side with the man skilled in martial deeds. In Athens not merely political but legal issues were settled in the public forum. Political advancement and civic honor depended more upon the power of persuasion than upon military achievement. As general intellectual curiosity developed

among the learned men, power to interpret and explain was connected with the ability to set forth a consecutive story. To give an account of something, a *logos*, was also to account for it. The *logos*, the ordered account, was the reason and the measure of the things set forth. Here was the background out of which developed a formulated theory of logic as the structure of knowledge and truth.

Of itself, however, it was only a background. Definite formulation of theory was the product of fermentation introduced by the philosophers. In the sixth and fifth centuries B.C. the Greek world of the Mediterranean basin was the scene of travel, commerce and social intercourse. The result was the development among the intellectual class of a kind of cosmopolitanism. Scholars, called wise men (*sophists*), subjected the various arts—military, civic and industrial—to analysis and report. In consequence these arts, which formerly had a local meaning and scope, resting upon the tradition and customs of a particular community, were given a theoretical treatment. They were lifted out of their special environments and subjected to rationalization. The period was characterized by the preparation of an enormous number of dissertations covering all the arts. Traveling scholars as they went about offered to teach the arts by methods which rendered slow practical apprenticeship unnecessary. Finally, some of the more ambitious of these men offered their services to the young men of Athens, claiming that they could teach the “virtues”—an English word which gives only an awkward rendering of the Greek term, since the latter denotes skilled excellence in the arts, especially the political arts, combined with that power to command the attention of others which would assure civic preeminence. For those going into political life this promise involved training in ability to speak in private groups and in the public forum and formed the beginnings of a kind of practical logic.

Under the merciless attacks of Plato the name sophist took on an invidious meaning. He claimed that the method of the sophists was one of sham; that it was the art of appearing wise, not of being so. It aimed not at truth but at persuasion by whatever specious arguments would silence an opponent. Plato insisted therefore that the method of the sophists was one of contention, aiming at victory over others and hence assuming ultimate division in the structure of the mind. A true method, on the other hand, is a cooperative search, assuming an objective unity beneath all

divisions of opinion and belief and terminating in the production of a common understanding sustained by grasp of the one relevant objective truth. Hence Plato called his method dialectic, a term obviously derived from the dialogue of those engaged in the exchange of ideas.

Part of the logical work of Plato consisted in pointing out some of the tricks by which the sophists made “the worse appear the better reason.” This material was formulated by his successor Aristotle and remains today in logical treatises under the caption of fallacies. His positive contribution was his theory of the universal, the principle underlying the differences of different instances. Aristotle thus gives the Platonic Socrates credit for the discovery of induction and definition. Induction (better termed education) was the process by which the universal was extracted from a number of varying cases, definition the process by which this principle was fixed for use in all subsequent thinking. In Plato’s system this universal constituted the “essence” or true and ultimate reality of the things in question. Aristotle criticized the resulting isolation of the universal from particular things. This isolation agreed both with Plato’s mathematical interests and with his desire to obtain a method for social reform, since the separate universal provided an ideal reality which could be placed in contrast with existing things.

Aristotle was above all a naturalist. He asserted that the universal is united with particular existences, binding them together into a permanent whole (the species) and keeping within definite and fixed limits the changes which occur in each particular existence. The species is the true whole of which the particular individuals are the parts, and the essence is the characteristic form. Species fall within a graded order of genera as particular individuals fall within the species. Thinking is the correlate of these relations in nature. It unites and differentiates in judgment as species are united and separated in reality. Valid knowledge or demonstration necessarily takes the form of the syllogism because the syllogism merely expresses the system in which, by means of an intervening essence, individuals are included in species. Definition is the grasp of the essence which marks one species off from another. Classification and division are counterparts of the intrinsic order of nature.

Thus the logical theory which furnished the intellectual method of Europe for almost two thousand years was formulated when the appliances of observation and experimentation

upon which modern scientific inquiry and testing depend were lacking. Moreover the only mathematics available was geometry, upon the model of which Alexandrian scientists constructed the astronomical frame. The traditional logic was a logic for clarifying and organizing that which was already known or that which was supposed to be known and hence currently believed. For putting this material in rational form, placing upon it the stamp of rational authenticity, logic was an unrivaled instrument. But it could not furnish means for breaking through the limits of the intellectual content of current culture so as to make discoveries in new fields. The ultimate premises, or validating principles (beginnings), of all knowledge were assumed to be already in the possession of the mind. Sense perception supplied the demonstrative material on the side of the particulars, and rational perception of self-evident truths, or axioms, performed the same office on the side of universals. Human learning, or discovery, was limited to putting these two given things together.

In its own intention the Aristotelian logic was a logic of truth. It set forth the structure of valid knowledge, which corresponded in turn to the systematic structure of reality. But when after the decline of interest in nature ancient culture became introspective and retrospective, logic declined more and more to a mere formal instrumentality of exposition and communication. The ethical schools, skeptic, Epicurean and stoic, either deprecated the study of logic as of no importance (or even harmful in distracting attention from the supreme business of the conduct of life) or else reduced it to a mere device for avoiding error in moral judgments. Higher learning, as in the universities of Athens and Alexandria, devoted itself to organizing and interpreting the literatures of the classic past and put logic on a level with rhetoric as a formal aid in this task.

The administrative genius of Rome had little use for inquiry and reflection for their own sakes. It was interested in the method of thought as far as it could be used as a tool of political life. At first this was in form largely subordinate to rhetoric in the guidance of oratory when, as in the time of Cicero, oratory played a crucial part in civic rivalries. During the empire logic was the instrument for organizing the complex legal body of rules and decisions under fixed general principles, derived if possible from the "law of nature." Logic thus became definitely a formal discipline useful in arranging material for pur-

poses of argument, exposition and instruction.

The Christian church took over this conception of logic and employed it as an agency for similar purposes of attack and defense, especially the defense of doctrine against pagan without and heretic within. During the great scholastic period of the twelfth and thirteenth centuries there was, however, a striking revival in the scope and vitality of formal logic. The writings of Aristotle came to Christendom through the Arabs. Intellectual activity was stimulated to undertake a comprehensive organic survey and formulation of Christian doctrine, with a view to showing its intrinsic harmony with reason even when the material of revelation was above reason. The relatively scanty axioms and first principles of Aristotle were expanded to include the authoritative truths of the Scriptures, fathers, church councils and popes. An extraordinarily stringent method of demonstrative exposition was built up in which all possible objections were considered and refuted in syllogistic fashion until the authorized body of doctrine was intellectually organized into a system.

The universities, which were the centers of intellectual life, played their part. Great teachers met all comers in intellectual tournaments. Teaching was influenced by the method of doctrinal discussion while it also contributed to the perfecting of the latter method. The constructive intellectual movement which gave meaning and point to the development of formal logic degenerated after the work of unifying Christian dogma and rationalizing its structure had effected its purpose. There followed that period of hair splitting and refining which tended for a long time to throw the term scholastic into disrepute. What was even more important, the center of intellectual gravity was shifting. Secular and humane interests were taking the place of ecclesiastical and theological concerns. Satisfaction of the new interests directed man toward nature and new intellectual methods were demanded. The cry went up that the old logic was one of words only and that what was required was a logic which would enable men to cope with things. New physical instruments and materials were invented or were introduced from the Orient. Travel and exploration extended the scope of intellectual data. The demand arose for a logic of discovery and new inquiry. Literary persons joined with reformers of society and of science in ridiculing the pretensions of syllogistic logic. Mathematical concepts, in conjunction with the apparatus of the newly developing tech-

nology, replaced the ideas of essences, genera and species as central in the constitution of nature.

The full history of the revolt and of the many more or less inchoate and antagonistic attempts to formulate a new logic is practically identical with the intellectual history of the period from the seventeenth century to the present. There soon appeared a division which, while technical in outer appearance, may be said to have had an almost tragic effect upon the intellect of the western world. This was the split between those who appealed exclusively to experience in the form of sense perception as the source of valid beliefs and those who appealed to reason in the form of mathematical concepts as the ultimate authority. Ignoring refinements one may regard Francis Bacon and Descartes as the representatives of the two movements. On the whole, with some notable excursions from each side into the territory of the other, Great Britain adhered to the empirical school and the continent to the rationalistic.

The tendency of the latter school was to engage in conceptual constructions and dialectic manipulations. Aside from mathematics and the subordination of physical phenomena to mathematical formulae (a field in which it won some notable triumphs) the rationalistic school took almost complete possession of the fields of morals, jurisprudence, political theory and rational theology, theology supposedly emancipated from supernatural bonds. It was thus supreme in the entire realm of what would now be termed the social sciences. The devastating wars of the seventeenth century, civil and religious, fostered a demand for a rational and moral standard as an authority above and untouched by shifting temporal struggles. Norms were demanded which could be applied securely to empirical social and political phenomena. To this end they must proceed from the source of reason which was superior to mundane and human vicissitudes. Grotius, for example, revamped the law of nature of the mediaeval period to help rationalize international relations, and his successors in various fields of jurisprudence and morals made his method of appeal more and more stringently logical.

The tendency of the rationalistic method was optimistic and justificatory or apologetic. The underlying assumption was that empirical social phenomena, however much they might fall short of rational norms, were yet subject to their authority. Actual institutions might be criticized

in their detail as coming short of the law of reason, but their essential nature was justified as a manifestation of universal rationality. Thus Spinoza, who was anything but a political conservative in his ultimate ideal, held that the function of the state as a representative of law and therefore of reason and universality is so intimate and necessary that no conceivable abuse of authority justifies rebellion.

The religious civil wars of the seventeenth century had an opposite effect in Great Britain. They strengthened the empirical school because they created an atmosphere of moderation and compromise. The necessity for toleration was so evident that desire to carry through any comprehensive set of beliefs to its logical end was effectively dulled. The Revolution of 1688 not only established John Locke as the official intellectual apologist of popular rights (including the right and duty of rebellion) but made the empirical method developed by Locke in his *Essay on the Human Understanding* supreme in the fields of morals, politics and natural theology until the early part of the nineteenth century.

David Hume detected what was logically the weak point in Locke's empiricism by showing that it left no place for intrinsic relations and thus resulted in an intellectual atomism whose only justifiable philosophic conclusion is complete skepticism. Nevertheless, Hume appealed to habit and custom as practical if irrational unifying and relating forces. Thus he really succeeded in strengthening rather than upsetting the empirical spirit in British thought. At most he gave it a conservative turn by insisting that habit is the sole ultimate principle of unity and coherence and so prevented the critical liberalism of the school of Locke from taking a radical turn. Hume's work bore its distinctly philosophic fruit in Germany. It destroyed rationalistic complacency in the mind of Kant and started him on the way to producing a philosophy which would give sense experience the function of supplying the matter of all justifiable beliefs and practical acts, while reason would furnish its rational forms, its justifying norms and inescapable imperatives. Kant's successors in Germany all felt that Kant's reconciliation of sense and reason in logical method as well as in the practical and moral applications of the new logic was mechanical, leaving the two factors in unstable equilibrium. The movement toward their organic union culminated in what may not unfairly be called the institutional idealism of Hegel.

The technical transformations wrought by

Hegel in logical theory, with his dialectic movement of thesis, antithesis and synthesis, lie beyond the scope of this article. In substance it may be said, however, that Hegel sought a logic which would avoid the abstract, non-historical character of the earlier semimathematical rationalism. He wished in effect to make the movement of history the supreme rational manifestation. If philosophical and terminological technicalities are ignored, his work may be characterized as an attempt at a logical apotheosis of the historical method; indeed it was largely through his influence that the historical method was in the first half of the nineteenth century brought to consciousness in the fields of law, politics, morals, language, religion and political economy. Hegel piously retained the rationalistic idea of the supremacy of reason and absolute mind in history.

As far as fundamental logic was concerned, however, there was no great upset when Marx "stood Hegel on his head," as he said, and treated the ultimate logic and dialectic of history as essentially economic in character. The growing importance of evolution in biological science, with its stress on biological realism or biological materialism, was largely responsible for this rise of economic realism or materialism as an interpretation of human history. With Marx' official successors the materialistic dialectic of history was developed in an absolutistic spirit which made the complete downfall of bourgeois and capitalistic society inevitable, leading so necessarily to the social synthesis of communism as seemingly to free human action and planning from any responsibility in producing social change. The net tendency of the logic of historicism in its identification with evolutionism was to elevate an automatic movement of history to the position of supreme arbiter.

In Great Britain during the nineteenth century there was a rehabilitation of empirical method. It is noteworthy that Mill's logic was originated by his desire to introduce scientific method into social and moral subjects. He was offended by the adherence to dogmatic authoritarian methods in this field as well as by the position, typified by Macaulay, that in morals and politics we must depend only upon precedent and individual insight, political phenomena as such being outside the scope of scientific method. According to Mill, we can rise from observations to hypotheses, develop these hypotheses deductively and then apply them to social as well as to physical material. Mill's particularistic assumptions led him, however, into an extreme individualism

which prevented realization of his scientific aim. On the other hand, the increasingly dispersive and disintegrative tendencies of social life led a group of English thinkers to rely upon the "organic" logic of the German idealistic school as the best means of combating atomistic individualism. For a generation in the latter part of the nineteenth and the early part of the twentieth century this philosophy and logic were almost dominant in English thought. Their influence coincided with the ebbing of the liberalism of the type of Locke and Mill and the growing desire for state regulation of private enterprise. Whether Hegel so intended or not, there is no doubt that the premises of his logical method are conducive to collectivistic policies in social matters.

The split in schools of method earlier referred to as characteristic of modern life continues into the present. On the whole at the present time the conceptualistic methods of the rationalist school find little favor in the social sciences. The latter are devoted largely to empirical fact finding and to the attempt to arrive at social laws "inductively." Abstinence from general ideas is accompanied, however, by remoteness of social method from guidance of social, legal and economic phenomena. The split is called tragic because it is the sign of failure to find a generally accepted method which will do in control of social forces what scientific method has accomplished in control of physical energies. We now oscillate between a normative and rationalistic logic in morals and an empirical, purely descriptive method in concrete matters of fact. Hence our supposed ultimate ideals and aims have no intrinsic connection with the factual means by which they must be realized, while factual data are piled up with no definitely recognized sense of their bearing on the formation of social policy and the direction of social conduct.

Consciousness of this situation has been a main factor in a new attempt to generalize the experimental side of natural science into a logical method which is applicable to the interpretation and treatment of social phenomena. So far this recent movement remains almost entirely American in character. It was initiated by Charles S. Peirce and carried out especially in morals and religion, under the name of pragmatism, by William James. It is characteristic of this logical school to insist upon the necessity of conceptions which go beyond the scope of past experience for guidance of observation and experiment, while it also insists that ideas are only

tentative or working hypotheses until they are modified, rejected or confirmed by the consequences produced by acting on them. Emphasis upon experiment differentiates this method from historic empiricism as well as from present fact finding methods. The latter treat social inquiry as wholly outside the facts investigated and merely survey and record data in a certain field. The *novum organum* called for by the experimental logic insists that no such separation is possible in social matters, and that ideas and principles must be employed to deal overtly and actively with "facts" if, on one side, the facts are to be significant and if, on the other, ideas and theories are to receive test and verification. Experimental logic would resolve the controversies, now four centuries old, between reason and sense experience by making both concepts and facts elements in and instruments of intelligently controlled action.

LOISEL, ANTOINE (1536-1617), French jurist. Loisel was a pupil of Cujas when the latter was an advocate at the Parlement of Paris; on various occasions he exercised the functions of *avocat du roi* and procuror general. Of very extensive learning, he published numerous works of history, archaeology, philology and Latin poetry. As a jurist he collaborated with Cujas in the study of Roman law and discovered important unpublished texts, the *Consultatio veteris*

jurisconsulti and the *Novellae majoriani*. But his principal work was the *Institutes coutumières*, which is the first synthesis of the customary law applied in the north of France. Until then the customs of each town and of each province had been the subject of independent monographs. Dumoulin, who first thought of unifying French law, taking as a basis the custom of Paris, failed in his attempt because it was too ambitious. Loisel, on the contrary, composed a very brief work made up of short legal rules formulated in archaic and picturesque language and assuming frequently the form of proverbs, which made them easily remembered. A great number of the rules retouched and rejuvenated have passed into the *Code Napoléon*. Loisel's intention was to compose for French customary law a work analogous to the *Institutes of Justinian*, a clear and convenient manual giving the essential principles and clarifying controversial points. Although the *Institutes coutumières* contain the same lacunae as the customs from which they are taken—they are very summary on the law of obligations but more complete on the law of persons, property, succession, marriage contracts and on feudal law—they may be considered the best résumé extant of French customary law. But their conciseness has obliged editors to add commentaries of unequal value. Loisel's *Pasquier, ou dialogue des avocats*, contains valuable information on the history of lawyers and the functioning of justice in ancient France.

GEORGES BOYER

Important works: *Institutes coutumières*, first published in Coquille, Guy, *L'institution au droit des françois* (Paris 1607); new ed. with notes by François de Launay (Paris 1688); ed. with notes by E. J. de Laurière, 2 vols. (Paris 1710 and 1758), reedited by A. M. J. J. Dupin and E. R. L. de Laboulaye, 2 vols. (Paris 1846); *Pasquier*, first published in *Divers opuscules* (Paris 1652), containing biography of Loisel by his grandson Claude Joly; new ed. by A. M. J. J. Dupin (Paris 1844).

LOMBARD, PETER. See PETER LOMBARD.

LOMBROSO, CESARE (1835-1909), Italian criminologist. Lombroso, who was professor of legal medicine at the University of Turin, came into prominence by the publication of his book *L'uomo delinquente*, in which he affirmed the atavistic origin of the born criminal. He based his contention on numerous anatomical, phys-

iological and psychic stigmata found in many criminals, stigmata which he declared were not natural to mankind at present but were peculiar to primitive and savage races. He believed that a conjunction of stigmata determined the type of inborn delinquency, which revealed itself externally; he portrayed this criminal type by means of composite, or Galtonian, photographs of criminals. He successively superimposed the complementary theses of epilepsy and moral insanity, which he regarded as secondary characteristics of atavism. In his detailed classification of criminals he acknowledged that not all were born criminals, formulating such categories as "criminals of passion," under which he included political criminals imbued with excessive patriotism; "insane criminals," including alcoholics, mattoids and hysterical criminals; and "occasional criminals," the victims of environmental factors. Although, as Haeckel pointed out, Lombroso's ideas on inherited criminality would lead directly, if social Darwinian doctrine were applied, to the use of the death penalty on a grand scale as a means of freeing the human species from its malefactors by artificial selection, Lombroso held the death penalty to be the last resource in the repression of crime. He favored instead methods of readaptation of the criminals and advocated the doctrine of the symbiosis of crime, by which society would utilize the serviceable qualities and aptitudes of the malefactors. In his studies of genius Lombroso concluded on the basis of selected data that genius was related to epilepsy. In 1880 he founded the *Archivio di psichiatria, antropologia criminale, e scienze penali* to further the views of his school. Although premature, exaggerated and now largely superseded, Lombroso's ideas stimulated the study of criminal anthropology and by their positivistic approach played a decisive role in the transformation of penology and criminal law, especially when supplemented by the work of Ferri and Garofalo.

LOMONOSOV, MIKHAIL VASILYEVICH (1711-65), Russian writer and scientist. The career of Lomonosov, the first Russian savant to receive a foreign training, was typical of the period of Peter the Great, when the Muscovite state was passing rapidly from feudal barbarism to the modern civilization of the west. Born in a fisherman's family in a village on the White Sea, he learned to read and write from a neighboring peasant and at the age of nineteen ran away to Moscow. There he was admitted to a monastery school, where he lived in indescribable poverty and showed an exemplary zeal in his studies. When the St. Petersburg Academy of Sciences applied to the Moscow Theological Academy for twelve good students to send abroad, Lomonosov, who was about to become a priest, was chosen as one of them. In Germany, where he spent five years, he received a thorough scientific training under the best natural philosophers of the time, including Christian Wolff. Recalled to Russia, he was appointed a member of the Academy of Sciences, which then functioned in place of a university; the rest of his life was spent in his official duties as an academician, which included, according to his own testimony, "lecturing and delivering public speeches, making new experiments, composing verses for solemn festivities, compiling rules of rhetoric for the Russian language and writing the history of my country."

Lomonosov's own inclination and genius lay in the direction of natural science, and had he been left to cultivate one branch of learning he might have made good his boast that Russia "could also give birth to a Newton." Today he is recognized as a neglected scientific genius of the first order, who in his published memoirs formulated the mechanical theory of heat, gave a corpuscular explanation of the elasticity of gases

and showed the continuity of the three states of matter. He opposed the phlogiston theory and anticipated by more than ten years Lavoisier's famous experiments on the calcination of metals. But his work in natural science remained very largely without influence on the main stream of scientific thought. Although Lomonosov was esteemed by his contemporaries as the greatest poet of the age, his verse is today unreadable. His real and effective achievement lay in his reform of the Russian language, which he transformed from an uncouth popular speech into a medium suited for cultural and educational expression. He wrote the first Russian grammar (1755), organizing it around the dialect of Moscow and in accordance with the general grammar of all languages considered in their natural evolution. The Russian orthography in use today is largely based on Lomonosov's work. In seeking to enrich the vocabulary he borrowed heavily from church Slavonic and developed a theory of three styles of discourse, in which the admixture of Slavonic varied directly with the solemnity and formality of the subject matter. This theory by impeding the secularization of style exercised to a certain extent an unfortunate influence on Russian literature. As a historian Lomonosov was by modern standards rhetorical, ultrapatriotic and uncritical. His educational influence on the formative period of Russian culture was as a whole enormous, ranking with that of Peter the Great in politics and government.

LONGE, FRANCIS DAVY (1831-1910), English economist, barrister and civil servant. He studied at Oxford, where he became interested in John Stuart Mill's economic philosophy. He was admitted to the bar in 1858 and was appointed assistant commissioner of the Children's Employment Commission; in this capacity he was brought into contact with the practises and opinions of large employers of labor. In 1860 he published *An Inquiry into the Law of Strikes* (Cambridge, Eng.), in which he sketched the development of statute and common law as to the combinations of workers from 1350. Release from official duties enabled him to formulate his growing dissent from the current wage theory; in 1866 appeared the eighty-page tract *A Refutation of the Wage-Fund Theory of Modern Political Economy as Enunciated by Mr. Mill, M.P. and Mr. Fawcett, M.P.* (London 1866, reprinted Baltimore 1904). The essay attracted no attention and copies sent by the author to Mill and Fawcett were unacknowledged. Upon the appearance of Mill's recantation of the wage fund theory (*Fortnightly Review*, n.s., vol. v, 1869, p. 505-18, 680-700) Longe had the unsold copies of his tract bound in new covers with a new title page bearing the date 1869 and a prefatory note referring to Mill's retraction. Longe's indictment of the wage fund theory thus preceded and was entirely independent of Cliffe Leslie's criticism of 1868, Thornton's attack and Mill's recantation of 1869 and Walker's definitive assaults of 1874-75. As to doctrinal relationship a *Quarterly Review* critic in July, 1871 (vol. cxxxi, p. 229-63), declared flatly that Thornton had adopted Longe's refutation without acknowledgment. Francis A. Walker asserted that "the decided inferiority" of Thornton's treatment carried acquittal of this unpleasant charge. Taussig believes that Longe "very likely was not known to Thornton." The issue remains moot; but on the whole the theory of independent origin seems the most likely, with no graver reflection upon Thornton and Mill than an ungenerous failure later to refer to the earlier contribution of Longe. In 1883 Longe wrote a critical pamphlet of *Progress and Poverty* with a review of Henry George's and J. S. Mill's wage theories.

JACOB H. HOLLANDER

Consult: Introduction in reprint of Longe's *A Refutation of the Wage-fund Theory* . . . (Baltimore 1904).

LONGFIELD, SAMUEL MOUNTIFORT (1802-84), Irish economist and jurist. He became professor of political economy at Trinity

College, University of Dublin, and later professor of law at the same university; for a time he served as judge of the Irish landed estates court. He wrote on questions of land tenure and estate law but his chief importance lies in his economic writings. Although he adhered in general to the doctrines of the English classical school he offered many important innovations and corrections.

Longfield's main contributions were to the theory of distribution and the theory of international trade. He rejected the wage fund theory and held that wages are determined by the value of the product of labor in industries producing working class commodities, discounted by the prevailing rate of profits. He stressed the existence of non-competing labor groups but pointed out that even when there is no mobility between two crafts equality in wages can still be maintained through mobility between these and the "intermediate" occupations. He explained the rate of interest as determined on the supply side by the degree of willingness of savers to "sacrifice the present to the future" and on the demand side by the marginal value productivity of capital, which he analyzed with extraordinary anticipation of later doctrinal developments. He pointed out that profits comprise an element of return to capital and another element of wages for the skill and labor of superintendence. He denied that increase of population necessarily means lower wages, since growth of the arts or decrease in profits may offset the tendency toward diminishing returns to labor. He explained the mode of determination of the values of commodities produced under conditions of joint costs.

To the classical theory of international trade Longfield made pioneer contributions: he analyzed the way in which the existence of non-competing groups affects the choice of export and import commodities, the effects of tariffs and absenteeism on the terms of trade, the operation of comparative costs and reciprocal demand in determining the course of trade and the effect of the introduction into the exposition of the doctrine of more than two commodities. He supported on the whole the banking school doctrine and pointed out that the only significant difference between deposits and banknotes is the greater velocity of circulation of the latter. He also showed how credit expansion by one bank tends to induce similar expansion by other banks and suggested a bank credit theory of the business cycle, which ordinarily lasts approxi-

mately five years and which consists of ten successive stages.

LONGSHOREMEN is the American term for workers customarily called dockers in England, waterside workers in Australia and transport workers in many other countries. It includes all workers engaged in the loading or discharging of vessels' cargoes and covers a wide range of types from the responsible lightermen of London and the steady *Kontraktarbeiter* of Hamburg to the "banana fiends" of New York and the swarming coolies of Shanghai.

Longshoremen may be classified roughly according either to the place of work or to the commodity handled. They may be "hold men," who "break out" or stow away the cargo in the hold; "deck men," who operate the winches, give signals and assist in swinging the "draft" from hatch to pier; or "pier men," who move the cargo to or from the ship's side. The first two groups require considerable skill and experience, the third relatively little, but all three require strength and endurance. Many workers, however, are able to specialize in handling certain commodities (often to the virtual exclusion of all others), among them grain, coal, lumber, ore and bananas. And even among the handlers of general cargo, who comprise the bulk of the workers and who accept as part of the day's work every strange product which the hold of a vessel may disgorge, there are jealously guarded lines of distinction between the deep water longshoremen, the worker in coastwise shipping and the despised "shenango," who handles the contents of harbor craft.

Longshore work has long been a synonym for casual labor and its attendant evils. Periods of enforced idleness have always alternated with periods of long hard labor; each employer has striven to have a large labor reserve available to

take care of peak activity. In the old days longshoremen, often hungry and despairing, engaged in tooth and claw struggles with each other to get jobs. Earnings were usually below the barest subsistence level. In England the first real improvement came after the London dockers' strike in 1889, resulting in higher pay, partial regularization of employment and improved methods of hiring. The strike moreover compelled investigation of the prevailing bad conditions and led to some remedial legislation, including accident prevention and compensation. The success of the strike had world wide effects, stimulating union organization and legislation; but in the United States it was not until 1927, long after accident insurance had become an accepted practise, that longshoremen were brought under the provisions of the workmen's compensation law. Decasualization in some ports has also materially improved conditions by regularizing employment and equalizing earnings. But despite improvements most of the fundamental evils of longshore work still persist; in the ports of the Orient, Africa and South America conditions are probably as bad as formerly.

The total number of longshoremen is unknown, and only certain suggestive approximations may be hazarded. The United States has perhaps 120,000, of whom some 50,000 are in New York alone. London has about the same number as New York, Liverpool about 20,000, Hamburg and Antwerp some 15,000 each and Rotterdam about 10,000. The numbers fluctuate even more markedly than do those of factory workers, because the docks act as a catchall for the overflow from other trades and for the failures and misfits from all walks of life.

All attempts to calculate average earnings are also merely suggestive approximations. There are, it is true, plenty of wage rates; but so great is the irregularity of hours worked that wage rates and actual earnings are often widely separated. The 1932 wage scale for the North Atlantic ports, for instance, provided for \$.85 per hour and \$1.20 per hour overtime, based on a week of 44 hours. And yet average earnings in so far as they may be estimated for New York were probably not more than \$15 to \$20 per week even for the relatively steady men. Earnings are only slightly higher in periods of prosperity; in 1928 the majority of New York longshoremen earned less than \$30 weekly, and many earned as little as \$10. The great majority of other ports would show even lower figures. With the exception of small groups of permanent

workers in decasualized ports the earnings of all longshoremen, whether hired individually or in gangs, whether paid by the hour or by the piece, are irregular and on the average very low.

Working conditions along the water front present many peculiar and difficult problems. Longshoremen must go from pier to pier in search of work. Hiring is usually still done at each pier by a foreman who has autocratic power and who picks his men arbitrarily from a "shape" of job seekers which forms two or three times daily. If a man fails to be selected, it is practically always too late to apply elsewhere. And even if he is chosen he never knows whether the work will last for one hour or twenty hours. Petty bribery of the hiring foreman is frequently invited and sometimes necessary; sometimes longshoremen have to "share" their meager earnings with the foreman. Unions measurably reduce the bribery. Waiting rooms, wash rooms and similar facilities are usually crude and very often lacking. The work is hard, with much heavy lifting of cargo, and exposure is part of the routine. Men who have been idle for days may work uninterruptedly on a particular job from twenty to thirty hours except for time off for meals. In every country dock work is near the top in the lists of dangerous occupations. Tuberculosis, pneumonia, bronchitis, cancer and rheumatism are common; while fatigue, faulty inspection of gear, undermanning, overspeeding and chance combine to produce a high accident rate.

Underemployment has always been a major problem of dock labor, and recently technological unemployment has added still further to the hazards of job hunting. It has not yet assumed alarming proportions among deep water longshoremen, who still work with relatively simple mechanical aids; but on the Great Lakes, with their heavy traffic in grain, ore, coal and other bulk commodities which lend themselves readily to mechanization, it has transferred whole fields of activity from men to machines. Technological unemployment in other industries has moreover increased the pressure of casuals seeking jobs on the water front.

In the face of such conditions and with a labor supply chronically in excess of demand and containing many racial groups and a large percentage of casuals in addition to a nucleus of steady workers, trade union organization has not been easy. Its achievements are therefore all the more significant. In England the first small groups of the late 1880's have been transformed into the great Transport and General Workers' Union.

The International Longshoremen's Association of the United States, including in its membership perhaps one third of all American dock workers, has been less successful, although its agreements govern working conditions in many important ports of the Atlantic and Gulf coasts. In Australia the Waterside Workers' Federation has repeatedly demonstrated its strength, often to the discomfiture of the entire commonwealth. Germany, Holland and the Scandinavian countries also have strong dockers' organizations. Many of these national bodies have in turn combined to form one section of the growing International Transport Workers' Federation, which includes seamen and land transport workers as well as longshoremen. The longshoremen's unions have frequently been a progressive force in the labor movement. They stimulated the growth of the "new unionism" in England, Ireland and Australia with the stress on militancy and industrial as against craft organization; in Hamburg the harbor workers organized into one strong union with substantial control over the labor market.

On the whole collective bargaining and arbitration are still on a precarious footing. Most of the oriental, African and South American ports are virgin territory from the standpoint of permanent union organization; and even in the well organized ports of the world the strike has long been a favorite weapon. Some of the most spectacular strikes of modern history, such as those of 1889 and of 1912 in London, that of Belfast in 1907, those of 1887 and 1907 in New York (the former led by the Knights of Labor) and several major strikes in Australia, have centered about the docks. Only during the years of the World War, when their position in international commerce, strategic at all times, was still further strengthened by the emergency, did European and American dock workers agree to accept limitations upon their right to strike.

Whatever their method, organized longshoremen have always been interested primarily in wages and hours and have only recently shown sustained and aggressive interest in the more fundamental problem of decasualization. The crying need of all dock workers has long been for greater regularity of employment and of earnings, which is most difficult of attainment because each employer has tended to mobilize about his own piers a labor reserve large enough to meet his demands on his busiest days. The resultant normal oversupply of labor and haphazard distribution of jobs can be remedied only

by a carefully planned scheme of decasualization which must stress at least three major points: registration to limit the total number of men who are eligible to seek work in any given port, regulated in accordance with the port's varying needs; a centralized or at least coordinated system of hiring, in which employers hire labor from a central office instead of individually, with provision for the rapid transfer of applicants from the less busy to the more busy areas, thus substituting a smaller but unified and mobile reserve for the present stagnant pools of labor; and a guaranteed minimum weekly wage to a nucleus of steady, experienced workers which will provide each employer with the backbone of an efficient and dependable labor force. Further desirable although not vital refinements of decasualization include a central pay office, organization of both employers and workers in order to facilitate the selection of a joint committee to be vested with the power to determine policies, the dovetailing of seasonal work and a system of rotation which will serve to equalize earnings among the individuals representing each grade of labor. The system of decasualization assures longshoremen an equal chance of securing available work, eliminates the foremen's arbitrary power and regularizes employment, hours and earnings.

Hamburg and Liverpool stand out pre-eminently among the world ports which have so far experimented with decasualization. They began to carry out their plans in 1907 and 1912 respectively and were the real pioneers in the field, although London had certain piecemeal measures at a somewhat earlier date. Other decasualized ports include Rotterdam, Amsterdam, London, certain Scandinavian ports and Antwerp, which was decasualized as recently as 1929. In the United States only Seattle, Los Angeles and Portland are represented, although Boston, Houston and Galveston have developed certain features which are suggestive of decasualization. Seattle, the first American port to introduce decasualization in 1921, has achieved a degree of success which may well challenge the attention of many larger ports. The general principle of decasualization, modified to suit the requirements of each individual port, is indispensable in dealing with the problems of dock labor. Unfortunately decasualization is occasionally bound up with anti-unionism; in all three decasualized American ports the employers refuse to recognize the union, and the system is consequently strongly opposed by the Inter-

national Longshoremen's Association. But the experience of Hamburg, Liverpool and many other European ports indicates that decasualization and unionism may be harmoniously combined and that moreover the unions may become the most effective instruments of decasualization.

LÓPEZ, VICENTE FIDEL (1815-1903). Argentinian historian and statesman. López was the son of the author of the Argentinian national anthem; from his childhood he came into contact with the outstanding politicians and intellectuals of the Plata River region from the initial days of independence until the difficult period of the organization of the nation, and he was influenced by them in the direction of patriotism and of intellectual pursuits. He became a member of the reformist group known as the Asociación de Mayo, fought the dictatorship of Rosas and lived in exile in Chile, where he helped to initiate an intellectual revolution, and in Uruguay. Upon

his return to Argentina he participated in national politics but was relatively unsuccessful because of his aggressive and inflexible character. In Uruguay he taught at the University of Montevideo and from 1873 to 1876 at the University of Buenos Aires. He contributed considerably to the political, legal, economic and educational literature of Argentina but his most important work is in history, where he made bold incursions into various divisions of the subject, a noteworthy example being his contribution to American prehistory which was published, in a French translation by the orientalist Gaston Maspero, as *Les races aryennes du Peron* (Montevideo 1871). His chief works, however, are those dealing with Argentina. Of particular importance is his *Historia de la República argentina. Su origen, su desarrollo político hasta 1852* (10 vols., Buenos Aires 1881-93; new ed. 1926), in which as in other works he made frequent use of the verbal information he had received from the protagonists in the great events in the history of his country, and which is therefore regarded as the greatest repository of the oral tradition of Argentina. Abridgments were prepared by the author for use in the secondary schools. López possessed great literary talent and as a historian sacrificed much exact documentary data to his desire for literary success. He was the chief representative of the school of the philosophy of history in Argentina. His history was largely political, for he held that the country had no other kind of history. He engaged in a controversy with Bartolomé Mitre, the leader in Argentina of the erudite school of historiography which was concerned particularly with the accuracy of facts; and as a result of the encounter López demonstrated that his model was Thucydides. López' influence has been felt by those who seek to explain the phenomena of history and especially by the sociological school of historians.

RÓMULO D. CARBIA

LÓPEZ DE PALACIOS RUBIOS, JUAN (c. 1450–1524), Spanish jurist. López de Palacios Rubios taught at the University of Salamanca, where he had studied, and at the University of Valladolid. He gained the confidence of Ferdinand and Isabella and assisted them in many of their important acts. Upon the dismissal of the members of the high court, or Chancillería, of Valladolid in 1491 he was one of the judges appointed to supersede them; when a similar court with equal powers was established at Ciudad Real he assisted as a member in the development of its tendencies. He participated in important matters involving relations with the papacy, and as a member of the Council of Castille (1504–24) he took an active part in the direction of affairs connected with the Indies and won the approval of the rigorous critic Bartolomé de las Casas. In Spanish juridical science López de Palacios Rubios represents a bridge between the Middle Ages and the Renaissance. His works, which were much consulted by later jurists, evince the somewhat undigested erudition of the mediaeval treatises; but they display a capacity for writing good Latin that other jurists of the time, such as Alonso Díaz de Montalvo, did not possess. His thesis that the American indigenes were not slaves constitutes the clearest title to fame of the Salamanca school of international law. But when he entered the realm of theory as an apologist of the Catholic kings he displayed certain weaknesses; he was willing to uphold the claims of monarchy as against papacy to the widest extent or to concede the most exaggerated powers to the latter, according to the manner in which the argument served the interests of his royal masters. It was neither as a scholar nor as a theorist, however, that he made his chief contribution to Spanish law but rather as a practical jurist who noted the defects of the contemporary law and applied adequate remedies in legislative projects. He cooperated in the preparation of the *Leyes de Madrid* of 1499, designed to improve the administration of justice. His influence upon the preparation of the highly important *Leyes de Toro* (completed in 1505), which were designed to clarify the existing law and which made important innovations in the realm of private law, particularly family law, was very great. He played a major part in the compilation of the

Leyes y privilegios del concejo de la Mesta in 1511.

LORIMER, JAMES (1818–90), Scottish jurist and political theorist. Lorimer was the son of the manager of an aristocratic estate and received his education at Edinburgh, Berlin, Bonn and Geneva. In 1862 after an indifferent career as an advocate he was called to the University of Edinburgh, where he lectured as professor of public law and of the law of nature and of nations until his death. In addition to legal works he published many occasional and controversial essays on political, ecclesiastical and educational questions. One of the original members of the Institute of International Law, he was the only British jurist of the day who spoke the continental language of natural law, and consequently he was long his country's academic spokesman in its delicate relations with warring foreign states.

Opposition to democracy, particularly in its Benthamite formulation, is central in Lorimer's writing. He was a member of the Conservative party and a vigorous pamphleteer against what he termed "vertical extension" of suffrage, advocating instead a system of plural votes allotted on the basis of wealth, education, age and professional position. In the field of private law he was a vigorous defender of existing inequalities in property distribution against radical and socialistic attacks. A similar insistence upon the importance of natural inequalities led him, in the field of international law, to challenge the postulate of the equality of states, to defend the principles of intervention and extritoriality, to deny Moslem or communist states the right to recognition and to include in his draft for an armed and effective league of nations provision for a council representing five or six powerful nations.

These practical proposals are organized by a philosophy of natural law which regards human law as declaratory of divinely established fact and holds the rectification of divinely implanted inequalities to be beyond the proper province of law. Lorimer's juristic thought is pervaded by the theologic assumption that what is good ultimately prevails, so that he finds it unnecessary

to distinguish between historical generalization and ethical criticism. His appeal to self-evident principles, in the manner of his teacher Sir William Hamilton and of the Scottish school of realistic philosophy, is commonly an appeal to generalizations from chemical or biologic laws (he tells us that he learned more law from the chemist Mitscherlich than from the jurist Puchta) or to political and ethical principles generally accepted by men of his own religion, race and class. Despite his narrow ethical outlook Lorimer served to free the study of law in Scotland from its provincial, trade school tradition by bringing students into contact with continental legal thought and by emphasizing the dependence of legal science upon economics, sociology, criminology, philosophy and theology.

LOTTERIES. The lottery is an arrangement in which an entrepreneur contracts with several persons in exchange for a certain payment to pay out sums of money or other valuable goods to those among them selected by a process depending upon chance. In this it resembles many forms of games of chance, which in turn are a subdivision of gambling (*q.v.*). Lotteries with money prizes are more common than commodity lotteries, or raffles, but mixed lotteries also exist, in which the winner may get either money or commodities as he prefers. Upon payment of his contribution, or stake, generally in cash but sometimes masked in another form, the participant usually gets a ticket, or chance, bearing a number; if the corresponding number is drawn he is entitled to a prize. Tickets which fail to win anything are called blanks. In the so-called interest lotteries all ticket owners get back at least the amount of their stake but only after a long period of time and without any accrued interest. In all lotteries (with very minor exceptions such as lotteries conducted by a small group entirely for its own amusement, as those arranged by ocean travelers on the basis of the day's mileage of their ship) the total of all the prizes plus the administrative costs is less than the sum of the prospective paid in stakes; the holding of a lot-

tery therefore yields a profit to the entrepreneur, unless too few chances are sold.

Lotteries may be run by national governments, by other public bodies, such as states and municipalities, by civic organizations and by private entrepreneurs. Most states supervise and tax lotteries not conducted by the state itself. The lottery may be used to increase governmental revenues, to raise funds for charitable or other civic purposes, to float a long term public loan, to provide popular amusement, to attract customers in business competition or, as a rule only clandestinely, to provide private profit. Lotteries may also be classified according to their procedural technique.

The following description of the most important forms of lottery combines procedural and functional bases of classification.

The lottery with simple number draw is used as a rule only for charitable purposes, usually as a commodity or a mixed lottery. The price of the tickets is uniform and small and their number very large, while the number of blanks is often 80 percent of all tickets. In the draw all the ticket numbers are placed in an urn or in a wheel of fortune, and as many numbers are drawn as there are prizes. The prizes are allocated to the several numbers either on the basis of the order in which the numbers are drawn or according to the prize indicated on a slip drawn from another urn or wheel of fortune simultaneously with the ticket number. Since the total value of the prizes is always less than the total paid in stakes, the probability value (the product of the possible prize and the probability coefficient) which the ticket purchaser receives for his stake is necessarily smaller than the price of the ticket. The entrepreneur's profit, provided all the tickets have been sold, is the difference between the total paid in stakes and the sum of the total value of the prizes and the overhead charges. If all the tickets are not sold, his profit depends upon whether the big prizes are won by sold or unsold tickets. It is therefore advantageous in lotteries in which experience has shown that only a small percentage of the tickets is likely to be sold, so to allocate the sum set aside for prizes that one prize, the "grand" prize, is very large, while the other prizes are correspondingly smaller. In such cases it is probable that the grand prize will be won by an unsold ticket. For example, Austria has for many years conducted for the benefit of a first aid organization a lottery in which the grand prize, an automobile, has never been won.

The class lottery, which is found only as a money lottery, is the most important form of government lottery. Its principal characteristic is that the draw does not take place all at once but in several sections or classes at certain intervals of time, the ticket price being divided into as many equal parts as there are sections. Only the proportionate partial payment need be made to participate in the drawing of the first class. Tickets are also customarily subdivided into shares, purchase of which entitles the holder to a proportionate share of the prize if the ticket's number is drawn. Tickets which win a prize in the first class are withdrawn from further play, but the remainder of their purchase price need not be paid. To participate in the drawings of the following classes, however, a ticket which did not win a prize in the first class must be renewed by payment of the proportionate price for each of the subsequent classes. As a rule two wheels of fortune are used in the draw, a number wheel and a prize wheel. By far the largest number of prizes as well as the biggest prizes are drawn only in the last class, so that one has to pay the full ticket price to be able to win a major prize. The present Austrian class lottery, established in 1913, in which prizes are paid out without any deduction and are subject to no tax, is an example of a modern class lottery. Two class lotteries are held annually, the interval between the first and final draws being somewhat less than five months. There are 84,000 tickets with 42,000 prizes in five classes. The price of a ticket is 240 schillings, or 48 schillings for each class; since tickets are also sold in fractional denominations (half, quarter and eighth tickets), one can participate in the first class for as little as 6 schillings. The smallest prizes equal the price of the ticket, while the grand prize totals 300,000 schillings; in addition a premium of 500,000 schillings is awarded the last drawn prize of 1000 schillings or more. The theory of probability shows that if the player enters only the first class he has a 9.44 percent chance of recovering his stake, while if he continues through the second class his chance is 11.09 percent, through the third 13.13 percent and through the fourth 15.04 percent; if he stays through the fifth class his chance of recovery is 70 percent. Hence it would be unwise from the player's standpoint to fail to pay the renewal fee and thus stop playing before reaching the fifth class. Fifty percent of the players lose all their stakes and 36 percent recover, while only the remaining 14 percent receive more than they put in. Of the total sum paid in for

tickets (19,142,000 schillings) 30 percent is retained by the government while 70 percent is distributed as prizes. Of the government's 30 percent there remains after deduction of the commissions of the lottery bureaus and other overhead charges an average of 3,900,000 schillings, so that the two annual class lotteries net the state about 7,800,000 schillings. In Austria this net profit is independent of the results of the draw, since the lottery bureaus (usually banks) must contract for all the tickets; in other countries, however, where not all the tickets are always sold, the net profit of the class lottery also depends upon chance.

In the number lottery, tickets are not sold at a fixed price, but the size of the stake is determined by the player himself and the prizes are not set in absolute figures but in multiples of the paid in stake. Every participant can play one or more numbers between 1 and 90; several players can bet upon the same number, and all these players win if that number is drawn. Chances apply only to one definite draw; in each draw five numbers between 1 and 90 are drawn. The player has the following betting possibilities, the prize differing in each case: indefinite selection, in which he wins if his number is among the five winning numbers; definite selection, in which he wins only if the number chosen by him appears among the five winning numbers in the order picked by him; ambo, terno and quaterno, in which he wins if two, three or four numbers respectively of those picked by him appear among the five winning numbers. Theoretically the player might also bet upon quinto, having to guess all five winning numbers, but this type of bet is not allowed in the existent number lotteries because of the extremely slight probability of winning (1 to 43,949,268); Austria also forbids betting upon quaterno. The probability value which the player gets in exchange for his stake is in every type of bet less than the stake. In Austria, for example, it is about 78 percent of the stake for indefinite selection and only 41 percent in terno play. That is why on the average the entrepreneur wins and the players lose (in 1930 the actual prize payments in Austria were 57.3 percent of the paid in stakes). In both Italy and Austria a tax on winnings reduces even further the player's chance of recovering his stake. In order to protect itself against the danger of excessive losses where many players bet upon the same numbers the lottery administration reserves the right to close certain numbers or to reduce the stakes before the draw. The amounts

wagered in this type of lottery are still on the increase and reached 18,400,000 schillings in Austria in 1930. Certain policy games or pools in the United States bear some resemblance to the number lottery, in that the prizes are determined by the last three or four integers in such large figures as the day's bank clearings in a particular city or the balance of a Federal Reserve Bank.

Lottery loans are a combination of loan and lottery: the entrepreneur (usually the government or a privileged body) sells a long term loan in the form of bonds (also called lottery chances), agreeing to pay certain holders selected by lot premiums of various amounts in addition to the paid in value. Owners of undrawn bonds receive the face value of the bond (chance loans) or the face value plus interest at a low rate (premium loans). Thus the player loses at most all or part of the interest on his capital (interest lottery). The funds for the premiums are obtained in non-interest bearing lottery loans from the interest on the loan capital and in interest bearing loans from the difference between the low interest rate paid and the prevailing higher rate of interest, and furthermore from the compound interest, if interest is paid only upon the drawing of the bond. The lottery loan provides cheaper credit than is ordinarily obtainable at the time the loan is floated; this explains its prominent role in the financial history of many governments. It may result in a loss to the loan debtor, however, if the prevailing interest rate drops during the term of the loan. Unless barred by law lottery loan bonds are traded on the stock exchanges as ordinary securities. The public may thus profit through the purchase and sale of the bonds as well as through the premiums. In most lottery loans the draw is effected in two sections separated by an interval of time. The series is drawn first, and after the lapse of several months the winning numbers are drawn from it. In the interim the bonds of the series drawn rise on the stock exchange. Finally, the lottery loans offer the further possibility of selling only the chances of a certain bond's winning in a certain draw (so-called rights). For a small sum the purchaser obtains the right to the entire premium if the bond is drawn in the draw; if it is not drawn, he loses all he paid for the right.

Lotteries for popular recreation consist predominantly of small commodity lotteries conducted at charity festivals, fairs, amusement parks and similar places. The procedure varies. Sometimes each player purchases by chance or

selection one or more numbers within a definite numerical range, and a wheel of fortune determines the winning number. Sometimes he picks one of a group of rolled up tickets, prizes varying in value having been set up in advance for the tickets bearing certain numbers. This is also the principle of the punchboard, which is used for commodity and money prizes in the United States.

Advertising lotteries involve the distribution by business men of money or commodity premiums among their customers by lot or by some other form of chance. Often each customer has, as such and without any additional payment, a chance of winning a prize, and the winner is picked by the order of sales or by some similar circumstance. Again, every package of a commodity may contain a token—a letter or a picture—invisible from the outside; and anyone getting as the result of several purchases a certain group of such tokens—a series of pictures or the letters forming a certain word—receives a prize. Where only those customers who solve a puzzle set by the entrepreneur are eligible for the premiums (so-called puzzle contests), a lottery exists only when the problem is so simple that the average person can solve it correctly or when the correct solution of the problem cannot be obtained by intellectual effort or skill but must be guessed; for in both of these cases chance governs the distribution of the prizes. Where more than one entrepreneur participates in an advertising lottery, each generally contributes to the cost of the prizes roughly according to his sales or capital; where such a lottery is conducted by an organization independent of the merchants themselves, the management of the lottery may derive a profit from the difference between the fees paid in by the participating stores and the sum of the value of the prizes and the cost of administration.

The term sweepstakes, formerly used to denote horse races in which the winner takes all the prizes, has come to be associated with a particular form of lottery based on various important horse races. A great many contributors buy chances on a particular race; some time before the race each horse is assigned to a particular ticket holder, the great majority drawing blanks and thereby losing their stakes; the holder of the ticket on the horse which finally wins the race receives all the stakes, or they may be divided among the holders of the tickets on the first three horses. A contributor to whom a horse is assigned in the draw can frequently dispose of all

or part of his ticket before the race at a substantial profit, varying according to whether his horse is a favorite or an outsider. Sweepstakes, which seem to have first developed in large numbers in England after the abolition of lotteries in 1826, were declared illegal as lotteries in that country in 1845; the legalization of charity sweepstakes by the Irish Free State in 1930 for a period of four years has complicated the problem of preventing sweepstakes transactions in England. Important sweepstakes, such as the Calcutta Sweeps and the Irish Free State Hospitals Sweepstakes, are patronized by people from all over the world.

The lottery did not exist in antiquity, although decisions were made by lot for various purposes, such as the distribution of land (distribution of the Promised Land among the Twelve Tribes of Israel, the allocation of provinces to the governors in Rome and the allotment of tilled land in the ancient Germanic village community) and the determination of guilt in primitive Germanic judicial procedure (ordeal). The commodity lottery originated in the Middle Ages in Italy, where merchants disposed of unsalable goods by means of a lottery procedure; aided by permissive interpretations of church law such lotteries spread quickly throughout Italy and were very common by the beginning of the sixteenth century. The first money lottery was probably established in Florence in 1530 for the benefit of the state. Commodity lotteries were established by various cities in Holland in the fifteenth century; in the eighteenth century the technique of the class, or Dutch, lottery, which is still used by the Dutch government, was evolved. Lotteries soon spread from Italy and Holland to France, Spain, Germany and Austria. Governments began to exercise the right of supervisory regulation to protect the public against fraud and subsequently ran lotteries themselves as a source of income. As the sovereign's power increased, the right to run lotteries was made his sole monopoly (the royal lottery prerogative), which he might lease to others. In 1569 the lottery was introduced into England by Queen Elizabeth as a state lottery and was utilized by England as a source of state revenue until 1826. The number lottery, or lotto, arose in Genoa at the beginning of the seventeenth century; it was patterned after the bets made upon the names of the five new senators, who were chosen by lot in Genoa from the list of candidates, the numbers from 1 to 90 being substituted for the candidates' names. This form of play spread so rapidly throughout

Italy that it supplanted the ordinary lottery, and even today the state lottery in Italy is of this form. During the second half of the seventeenth century the Genoese number lottery was imitated in France, Germany and Austria, whose governments granted concessions to Italian entrepreneurs; but it held its own only in Austria, where it has been run by the government itself since 1787. In Germany it was supplanted by the class lottery system patterned on the Dutch model, which was first established by the cities and has been operated by the Prussian state almost uninterruptedly since 1794. The interest lottery was first tried in Austria in 1721 with a class lottery planned for twenty-five years, which was operated by the *Orientalische Kompagnie*, and soon collapsed; it developed during the nineteenth century in the form of numerous governmental lottery loans.

After the French Revolution the lottery was opposed by liberals as a disreputable source of state revenue; this led to the abolition of state lotteries in England in 1826 and in France in 1836. France permits only licensed private lotteries for the benefit of charity and the fine arts and lottery loans issued by municipal and local governmental agencies with the sanction and approval of the national government. Except for art unions, specially exempted by an act of 1846, English law permits no lottery without specific parliamentary sanction, which has not been granted since 1826. During and immediately after the World War, however, temporary administrative relaxation tacitly sanctioned a great many charitable lotteries, and in 1918 legislation intended to legalize lotteries by registered war charities almost passed the House of Commons after having been accepted by the House of Lords. In the same year a proposal that England float a lottery loan to ease the financial burden was adversely reported on by a select committee which investigated it. Another attempt to secure parliamentary action legalizing lotteries for charitable, scientific and artistic purposes was made in 1932. In Germany, on the other hand, the Preussisch-süddeutsche Klassenlotterie, based upon agreements embracing several states, covers almost the entire Reich. It holds two class lotteries annually, each having 800,000 tickets and awarding prizes totaling 114,260,100 marks, a deduction of 20 percent being made by the administration when the prizes are paid. Moreover the national government levies a tax of 20 percent upon the sale of the lottery tickets. Saxony and Hamburg operate lotteries of their

own. Austria operates three types of state lottery (class, number and state charity), levying a tax of 25 percent upon all winnings except in the class lottery. In addition there are private lotteries for civic purposes licensed by the government as well as governmental loan lotteries. Numerous lotteries, most of which were established for the purpose of aiding education, existed in the United States in the early part of the nineteenth century; some were licensed by the state governments, others operated by these governments themselves. The Continental Congress in 1776 authorized a class lottery for the benefit of the soldiers in the field, and a form of premium loan was floated by the new nation in 1784. As a result of growing opposition lotteries were prohibited by New York and Massachusetts in 1833; other states followed their example, and after Congress prohibited the use of the mails for lottery purposes in 1890 the last of the privileged lotteries, the Louisiana State Lottery, which had been operated by a private company under a franchise bringing the state \$40,000 a year, transferred its operations to Honduras, where it still exists. The operation of a lottery and the sale of tickets are punishable in all states, while many states also penalize various other acts in connection with lotteries. In addition to the use of the mails for lottery purposes federal law also penalizes the importation, interstate transportation, traffic transit over any part of the United States and receipt of all printed matter pertaining to a lottery. Despite these prohibitions lotteries of various kinds still flourish in the United States. Like the United States, Japan forbids all lotteries. In the Union of Soviet Socialist Republics all lotteries were forbidden on July 24, 1923, but a statute of January 1, 1930, sanctioned such lotteries as might be approved in each individual case by the People's Commissars for Finance and for Workers' and Peasants' Inspection. The government at one time floated a premium loan but now conducts no state lottery.

The penal provisions against lotteries which exist in almost all countries are intended to prevent the excessive spread of gambling and to protect the public against fraud, as well as to safeguard the governmental monopoly in those countries which operate national lotteries and to assure effective revenue and regulatory control in those which permit private lotteries under requirements of license, tax or both. The criminal concept of a lottery is much the same in all countries, but it is impossible to distinguish it clearly, on the one hand, from other games of

chance, which are subject to other penal provisions in most countries, and, on the other, from legal advertising inducements and contests. The apparent distinguishing feature—one entrepreneur contracting with a number of players who are not juridically interrelated—is also present in gambling schemes of the type used in Monte Carlo, which are not considered lotteries. In the United States three characteristics have generally been recognized as prerequisite in order to establish an arrangement as a lottery: distribution of prizes, dependence upon chance and consideration for the right of participation; the application of these general criteria to particular cases has proved extremely difficult, however, especially in certain forms of advertising schemes.

The nature and forms of the lottery make it a problem of almost all branches of the social sciences. Two motives induce the player to exchange his money for a probability value smaller than his stake. The first is the satisfaction of a need which the lottery affords through the feeling of daring and through the tension of awaiting the results of the draw. The greater the interval of time between the purchase of the ticket and the draw, the less the influence of the gambling spirit, which is therefore most prominent in the smaller lotteries for popular recreation and in the number lottery, less prominent in the class lottery and least so in lottery loans. The second motive, the hope of winning, is based on the peculiar law of valuation according to which the subjective valuation of a potential prize does not diminish proportionately with the probability coefficient but tends to remain larger than the product of the value of the prize and the coefficient. Thus with equal probability values the small chance of winning a large sum is valued more highly than the large chance of winning a small sum. According to the theory of marginal utility the high utility value of the share of his few possessions which the poor man uses as a lottery stake should make such purchases even less economically rational. Whereas in property insurance, however, where the policyholder also values the slight probability of a large loss above its objective probability value, the law of valuation and the theory of marginal utility support each other, since a quantity of goods to be lost is involved, in the lottery this law of valuation is so strong as to overcome the opposite pull of the marginal utility factor. Superstition often strengthens the player's motives: many optimists believe that fate has destined them for good fortune and that they must "open the door to op-

portunity" by buying a ticket. In the number lottery bets upon certain numbers are motivated by dreams, prophecies and the like; modern astrology even endeavors to set up relationships between lottery winnings and horoscopes. Significant from a sociological and economic standpoint is the fact that the smaller lotteries and the number lottery are patronized largely by the proletariat, whereas the patrons of the class lottery and lottery loans are drawn chiefly from the middle class. Hence the governmental number lottery acts like an antisocial taxation of the poor; in addition it possesses the disadvantage that the prizes are won by people who, experience has shown, are not apt to make thrifty use of unearned capital. In middle class circles, however, because of characteristic habits of thrift it is more likely that lottery prizes will be employed for capital accumulation. Furthermore from the standpoint of the possibility of productive investment by the lottery administration of the large sums put into them by the people (in 1930, despite the poverty of the country and although the total population is but 6,500,000, the amounts paid into the class and number lotteries in Austria totaled 53,500,000 schillings), class lotteries and lottery loans with their long time intervals between purchase of the stake and payment of the prizes are superior to the number lottery. For this reason proposals have been made to substitute interest lotteries for the existing lotteries, either in connection with savings banks (as in the Scherl "thrift premium systems," which were the subject of much discussion in Germany between 1890 and 1904) or in the form of a governmental class lottery, in which the undrawn tickets would be repayable without interest after a long period of time. These are the basis of the Molling plan for the reform of the German class lottery, which was unanimously approved by the experts in an inquiry conducted by the Friedrich List-Gesellschaft in 1930. Liberal opposition to governmental lotteries has not been aimed at interest lotteries. With the adoption of such lotteries the exchequers of countries accustomed to revenue from the lottery monopoly would be able to retain a source of revenue which could be replaced only by an unpopular increase in taxation. If private lotteries for civic purposes and advertising lotteries are to be allowed at all, governmental regulation is desirable to protect the public against the concealment of excessively small chances of winning. From the standpoint of enforcement it is important to prevent the

evasion of existing lottery prohibitions either through participation in foreign lotteries or through the recurrent appearance of new devices which conceal lottery operations under a variety of designations. Play in foreign lotteries, which adversely affects the balance of payments and the domestic money market, persists despite existing prohibitions. The tickets of the Danish Colonial Lottery, for example, are sold exclusively outside of Denmark. Aside from these considerations of financial and economic policy the social harm resulting from excessive participation by the people in lottery play and the principal justification for the penal measures against it lie in its threat to economic morals—its tendency to accustom the masses to expect improvement in their economic situation through luck rather than through their own labor and ability or through some form of social action.

LOTZ, JOHANN FRIEDRICH EUSEBIUS (1770-1838), German economist. Lotz, a jurist and high administrative official of the Duchy of

Saxe-Coburg-Gotha, is considered the most capable representative of the Smith-Say school in Germany in the early nineteenth century. In his first major work, *Ueber den Begriff der Polizei und den Umfang der Staatspolizeigewalt* (Hildburghausen 1807), he set himself the task of defining the scope and administrative technique of the *Hilfspolizei* (the term designates the sphere of governmental activity in promoting economic development, as distinguished from *Zwangspolizei*, which denotes the narrower sphere of protection of life and property). Of greater importance is his *Revision der Grundbegriffe der Nationalökonomie, in Beziehung auf Teuerung und Wohlfelheit angemessene Preise und ihre Bedingungen* (4 vols., Coburg 1811-14), which is distinguished by both its rigorous analysis of fundamental concepts and its subjective approach to the theory of value. It exerted, however, a confusing influence upon subsequent writers by its elaborate differentiation between value in use, value in exchange and price.

Lotz' main importance, however, lies in the theoretical treatment of economic policy, to which he devoted his main work, *Handbuch der Staatswirtschaftslehre* (3 vols., Erlangen 1821-22; 2nd ed., 3 vols., 1837-38). His approach is entirely from the viewpoint of the consumer: the primary object of economic policy is to provide the consumer with low cost goods and it is the task of theory to determine the circumstances which are conducive to the attainment of this objective. One of the most consistent early representatives of economic liberalism—having been converted to classical views because of his disappointment over the failure of the government's grain supply policies—Lotz extolled freedom of competition. But in investigating the prerequisites of free competition he met with the problem of the effect of unequal distribution of wealth upon freedom of enterprise. Although he did not pose the problem with complete clarity, his very awareness of it marks him as one of the most important precursors of German socialism of the chair.

LOTZE, RUDOLF HERMANN (1817-81), German philosopher. The son of a physician, Lotze enrolled at the University of Leipsic as a student of medicine but took most of his courses in philosophy and the natural sciences. Intellectually he was already torn between two interests, the philosophic reconciliation of which was to be his lifelong task. These were his interest in poetry and aesthetics, which was enhanced by the inspiration of C. H. Weisse, who introduced him to the ideas developed by Fichte, Schelling and Hegel; and the interest in the natural sciences, which was prompted by the scientific reaction against idealism and *Naturphilosophie* and which Lotze developed under the guidance of such masters as E. H. Weber, A. W. Volkmann and G. T. Fechner. The whole work of Lotze is an expression of these diverging interests. The scientific interest was reflected in his work on physiology, *Allgemeine Pathologie und Therapie als mechanische Naturwissenschaften* (Leipsic 1842, 2nd ed. 1848), an attempt to expound purely mechanistic principles, and in his *Medicinische Psychologie* (Leipsic 1852), an outline of psychology from a physiological viewpoint. At the same time it was Lotze's belief that side by side with the realm of science there also exists the world of emotional values, of "happiness and unhappiness." Dissatisfied with the general worship of experience and the predominant faith in facts as a basis for the so-called exact sciences, he endeavored to vindicate the cosmic status of emotional values. For it is important not only to determine and "calculate" the course of events but also to appreciate them.

The two tendencies, the scientific and the personalistic, also found expression in Lotze's social theory. In the manner of Herbart he insisted upon a social science which should transcend the limits of individual psychology. But at the same time he also followed Herder in endeavoring to bestow meaning and purpose upon social and historical life.

Since the first stages of Lotze's creative career coincided with the collapse of German metaphysics, he refused to take the road of Hegel. Thus while believing that philosophy was concerned with reality as a whole, he denied that the course of the universe can be interpreted in terms of a single principle. A similar attitude is

manifested in Lotze's conception of history, which was for him not a general progressive advance but "a road from an unknown beginning to an unknown end."

Lotze's conviction that there existed side by side with the world of facts an emotionally revealed realm of values served to place the concept of value in the foreground and thereby to pave the way for the ever increasing significance which this notion acquired in subsequent German philosophy. To be sure, he himself formulated no doctrine of values in the proper sense of the term. But the suggestions contained in his doctrine of *Geltung*, or validity; the sharp distinction he drew between things which exist and truths which are valid, supplied thinkers like Windelband, Rickert and Simmel with a starting point for their speculations.

BERNHARD GROETHUYSEN

Important works: *Mikrokosmos*, 3 vols. (Leipzig 1856-64, 5th ed. 1897-1909), tr. by E. Hamilton and E. E. C. Jones, 2 vols. (4th ed. Edinburgh 1897); *System der Philosophie*, ed. by G. Misch, 2 vols. (Leipzig 1874-79, 2nd ed. 1879-84), vol. i tr. by B. Bosanquet as *Logic*, 2 vols. (2nd ed. Oxford 1888), and vol. ii tr. by B. Bosanquet as *Metaphysics*, 2 vols. (2nd ed. F., *The Ethical Aspects of Lotze's Metaphysics*, Cornell Studies in Philosophy, no. iv (New York 1901); Thomas, E. E., *Lotze's Theory of Reality* (London 1921).

LOUIS XI (1423-83), king of France. When Louis XI was consecrated king in 1461 upon the death of his father, Charles VII, he had already given striking evidence of two outstanding characteristics: extraordinary administrative talent and a passion for intrigue, which had on several occasions led him to organize revolts against his father. A much maligned son, he became from the standpoint of the evolution of the French state the outstanding king of the house of Valois. Dominated by a peasantlike passion for land and gifted with remarkable political realism, he so accelerated the long process of French unification that his reign may be said roughly to mark the end of feudal France. From the duke of Burgundy he repurchased the cities of the Somme in 1463. From 1465 he had to contend with a series of powerful coalitions against him; the first of these was the Ligue du Bien Public, organized under the leadership of Charles the Bold, later duke of Burgundy, and the duke of Brittany, which aimed ostensibly to bring about a reduction of taxes but really to curb the king's

authority. Although several times temporarily worsted in the vicissitudinous struggles Louis in 1472 succeeded by clever diplomacy in detaching Brittany from the alliance with Burgundy and England. In the meantime the opportune death of Charles, duke of Guyenne, had enabled him to seize that province. In 1475 he turned an English invasion to profit by bribing the enemy to retreat and to join him in an economic alliance, sealed by the Treaty of Picquigny. Upon the death of Charles the Bold in 1477 he took possession of Burgundy, Artois and Picardy, the last involving him in a bitter war with Maximilian of Austria; in 1481 he retook Maine and Provence from Charles of Anjou.

In his struggle against the nobles Louis followed and developed his ancestral policy of looking to the cities for support and of working with them for mutual benefit. His reign was characterized by a great development of the bourgeoisie, which he favored not only against the nobles but against the lower classes, as well as by the rise of fairs and of commercial markets. Almost his last concern was to create a uniform system of weights and measures and to assure internal commercial freedom. But he also established a supervision over the cities closer than that of any previous king, diminishing local liberties and appointing mayors of his own choice. Although preserving most of the older governmental organs he reenforced his individual authority by creating a new personnel recruited from the bourgeoisie and petty nobility. While he always preferred negotiations to war he expanded the army as a bulwark of kingship and introduced a considerable degree of permanence into royal taxation.

Louis XI was a patron of culture, the liberator of François Villon, the friend of Philippe de Commines; Jean de Ockeghem, the famous musician, and Jean Fouquet, the portraitist and miniaturist, were in his service. He displayed great interest in printing, the French origins of which date from his reign. A tireless worker, a self-reliant and autocratic king, who, however, regarded his power as a means for developing France, Louis XI was justly called by Michelet the sage of the fifteenth century. No French king has been more grossly distorted by legend.

PIERRE CHAMPION

Consult: Champion, Pierre, *Louis XI*, 2 vols. (Paris 1927), tr. by Winifred Stephens Whole (New York 1929); Sée, Henri Eugène, *Louis XI et les villes* (Paris 1891); Rey, R., "Louis XI et les états pontificaux de France au xv^e siècle d'après des documents inédits"

in Académie Delphinale, *Bulletin*, 4th ser., vol. xii (1899) 187-452; Petit-Dutaillis, Charles, "Le règne de Louis XI et le gouvernement des Beaujeu" in *Histoire de France depuis les origines jusqu'à la Révolution*, ed. by E. Lavisse, vol. iv (Paris 1902) pt. ii, p. 321-452.

LOUIS XIV (1638-1715), king of France. He became king in 1643 on the death of his father, Louis XIII, but governed independently only after the death of Mazarin in 1661. During the fifty-four years of his personal reign all Europe regarded him as the archetype of a king. Louis XIV succeeded more completely than any of his predecessors in making a reality of monarchy by divine right. He never admitted that he, who possessed the sacredness of divine ordination, could be subject to any legitimate limitation in the exercise of his authority. He was the master of all his subjects, of their possessions, even of their consciences. His revocation of the Edict of Nantes in 1685 was in his opinion the mere fulfilment of his duty to God to redress their errors. Louis XIV, the absolutist, was also the first French king who was an administrator. He cooperated industriously with his great minister, Colbert, in the latter's schemes to promote the unity and grandeur of the nation and so to enhance the majesty of the king. The first French system of centralized administration, the system which was to survive until the Revolution of 1789, dates from his reign. Progressively obliterating the local powers and supplanting them by the intendants, whom he sent as his agents to the provinces, he instituted a regime which in view of its control by a power believing itself responsible only to God was inevitably arbitrary. Thus Louis XIV deprived the monarchy of its old bulwarks in the nation. He aggravated the misery of the people, especially in the rural districts, and alienated the bourgeoisie, who as the incumbents of most of the local offices found themselves dispossessed by the intendants. The nobility he grouped about him at his court, but by that very act he incurred the responsibility of providing for its support and linked the fortunes of the monarchy to those of the privileged classes. The origin of the grievances producing the revolution is to be sought in the reign of Louis XIV. Louis' foreign policy was overly inspired by his love of glory and war, which on the occasion of the War of the League of Augsburg (1689-97) incited almost the whole of Europe against him. His urge toward aggrandizement, however, although it eventuated in internal exhaustion in the last years of his reign led to the extension of the national boundaries

and to the addition of a number of provinces which soon became wholly French: Alsace, Artois, Flanders and Franche-Comté. Louis' place is especially great in the history of French civilization. The classic French authors and artists found in him understanding and encouragement, and at the same time by surrounding himself with them he attained to an Augustan splendor. The Versailles which he created still arouses the admiration of all who contemplate it. It was with good reason that Voltaire called the seventeenth century the century of Louis XIV.

LOVETT, WILLIAM (1800-77), English publicist and reformer. Lovett was born in Cornwall and in 1821 he migrated to London. It was a time when doctrines and methods of social reform were being hammered out and he was soon at the hub of working class radicalism. In 1836 he organized the London Working Men's Association and shortly thereafter he became one of the leaders in the Chartist movement. He spent a year in jail (1839-40) as a result of his protests against police interference in a Birmingham Chartist meeting, but his decided opposition to Feargus O'Connor and the "physical force" element eventually estranged him from the conduct if not the ideals of the movement.

The increasing weakness of the Chartist cause confirmed Lovett in his views on the vital necessity of education and its power to emancipate the working classes, mentally, socially and politically. He taught working men's classes, wrote textbooks and in his desire for an enlightened public opinion contended strongly against all attempts to curtail the right of citizens to express their opinions. Like the other Chartists he desired universal suffrage; but he wished to see it extended also to women, a provision which was excluded from the charter because of a fear that it would "retard the measure." For the reform of Parliament in addition to the measures set forth in the charter Lovett advocated a compulsory

examination of all candidates, the delegation by Parliament of a limited and carefully defined number of matters to "district legislatures" and the restriction of the power of the House of Lords to obstruct legislation. Communism, Owenite socialism, except for a brief period in his youth, and nationalization of the land did not commend themselves to him; but he held that great benefits might be realized by judicious co-operation between capital and labor in the production of wealth. He proposed to check accumulations of wealth by abolishing primogeniture and entail and imposing heavy taxation upon inherited wealth and unearned increments. He also advocated the abolition of all indirect taxes.

Throughout his life Lovett was an internationalist. He held that the interests of the toiling masses of all countries are identical and he embodied his views in several voluminous addresses to the working men of other lands. War he regarded as "a pernicious waste of the fruits of . . . industry" and an "instrument for perpetuating national feuds and political slavery." As a first move toward its final abolition he proposed a "congress of nations" and a "standing court of adjudication," the former to devise a code of international law and to declare the outlawry of the instigators of wars, the latter to effect rational settlements of disputes between nations.

LOWELL, JAMES RUSSELL (1819-91), American author, editor and diplomat. Lowell came of a distinguished Massachusetts family; after his graduation from Harvard he was admitted to the bar but turned at once to literature. In 1848 he achieved wide fame with *The Biglow Papers*, semihumorous dialect poems caustically attacking the Mexican War and the annexation of Texas. As professor of modern languages at Harvard (1856-76) and as editor of the newly founded *Atlantic Monthly* (1857-61) he established his position as the outstanding American literary critic and scholar of the period. During the Civil War his second series of *Biglow Papers* and various patriotic poems exerted a heartening

influence upon the North. From 1864 to 1872 Lowell served with Charles Eliot Norton as co-editor of the *North American Review* and helped to supply the first intelligently sympathetic interpretations of Lincoln's reconstruction policy and of his statesmanship in general. Lowell's powers as a polished writer and speaker were obvious qualifications for a diplomatic career, and under Presidents Hayes and Arthur he served as minister first to Spain and then to Great Britain, where he was influential in strengthening Anglo-American intellectual ties.

Less self-reliant than Emerson or Thoreau, Lowell reflects in his opinions the principal intellectual fluctuations of a confused period of transition. In his youth an ardent supporter of William Lloyd Garrison's attacks on the old party system, the laws and the constitution, he found a more reputable haven for his idealism in the newly formed Republican party, which he continued to serve as a loyal and at times partisan spokesman both during its period of aggressive libertarianism and during its later period of intrenchment. But with the unmistakable evidences of deterioration in Republican leadership and policy after Lincoln's death Lowell shifted uneasily to the left, aligning himself with the moderate reformers—the American Manchesterians, Godkin, Schurz and Curtis—and supporting their assaults on the evils of the tariff and administrative corruption. While he made few speeches on issues of the day and indulged in few polemics, his fierce denunciation of political corruption added prestige and philosophical weight to the cause of moderate reform. His acquaintance with the United States hardly extended beyond the Alleghenies and his sympathies never succeeded in outgrowing a certain intellectual and social narrowness. He knew little of western agrarianism and what he knew of it he distrusted as radical. Disliking novelty he shrank from such movements as that for woman's rights and protested against the extension of suffrage in England. His unshaken reverence for the past kept intact his belief that the republic would endure only while the ideas of its founders remained dominant.

LOWELL, JOSEPHINE SHAW (Mrs. Charles Russell Lowell) (1843-1905), American social reformer. Josephine Lowell was one of the notable group of men and women who during the last quarter of the nineteenth century gave shape and impetus to the formation of social welfare agencies and institutions in the United States. She began her career with relief activities during and after the Civil War. In the early 1870's she became active in the State Charities Aid Association of New York and in 1876 was appointed the first woman commissioner of the New York State Board of Charities. A real commitment to the responsibilities of her office led her to investigate conditions in public institutions for the dependent and defective, a study which gave rise to most of her later projects. Among these may be counted her founding of the Charity Organization Society of New York, one of the earliest and probably the most influential of its kind in the country, and her campaign for state reformatories for women, for custodial care of feeble-minded women, for the establishment of a municipal lodging house in New York City, for the introduction of police matrons and for important reforms in the care of dependent children and the insane. Like Letchworth and Dugdale she based her reforms on sound data obtained by scholarly work in field and office. Although her actual work was confined to the city and state of New York, an imagination susceptible to new ideas and sensitive to social evils, a facile pen and great personal force made her influence practically national in scope. She wrote more than a hundred papers, articles, pamphlets and reports. Outside the field of social work her activities included civil service reform, an interest in the relations of capital and labor that resulted in the founding of the Consumers' League of New York, of which she was the first president, and active participation in the Philippine Progress Association, an organization opposed to American domination of the Philippines.

LOYD, SAMUEL JONES. See OVERSTONE, LORD.

LOYOLA, IGNATIUS DE (1491-1556), Spanish religious leader. Loyola, a Spanish nobleman, had been a military officer for ten years when protracted illness resulting from a wound received in 1521 brought to him, as to so many other Catholic saints, conversion and renunciation of the world. The first phase of his new life was marked by asceticism and in 1523 by a pilgrimage to Palestine which served merely as personal penance. It was only during his subsequent sojourn at Spanish universities and particularly at the University of Paris from 1528 to 1535 that he began to exert influence upon others through private preaching. In 1534 he organized a small group of his friends at Paris into a new order for missionary work among the unbelievers of Palestine; this embryonic order, while already imbued with the strong militaristic spirit which the mature Society of Jesus owed partly to Loyola's early life as a Spanish noble, as yet manifested none of the essential elements of the characteristic Jesuit point of view. When his missionary purpose was frustrated as a result of the outbreak of war between Venice and Turkey, Loyola went to Rome in 1537. There in the atmosphere of crisis created in the church by the Protestant Reformation he reformulated his plans and dedicated his order to the education of youth, preaching and the unconditional performance of whatever task was imposed by the papacy. The metamorphosis undergone by the society between 1534 and 1540, when the Curia confirmed it on the basis of the plan of 1537, attached particularly to its relations with the church. As a result of his experiences in Rome Loyola's impulse to care for souls became fused with his passionate desire to defend the church. Hence unwavering obedience to the Curia and absolute belief in the dogmas of the church to the exclusion of all private judgments became cardinal points in his system; not only were they prescribed for Jesuits but the order consecrated itself to the task of imposing them on the entire world. By this identification of the doctrines of the church with the will of God, Loyola represents the final stage in the evolution of Catholicism into a religion of authority. Luther had upheld the individual conscience; Loyola reacted by condemning it to annihilation. Thus since this period there have existed two fundamentally opposed ideals in Christian religious life. In the course of its later development the order was modified in important ways: it came to equate its own authority with that of church; and its general tone was greatly influenced by

the exigencies of warfare against Protestantism, in the struggle against which it had become an important power by the time of Loyola's death. His own views, however, remained unchanged after 1537. Henceforth he led a zealously active life at Rome, founding the Collegium Germanicum, persuading Paul III to establish the Roman Inquisition and creating asylums for children and unfortunate women. He became the first general of the order in 1541 and for the rest of his life carried on constant correspondence with his colleagues, assisting them with sagacious counsel and adjusting their disputes. In 1550 he prepared the society's definitive constitution, which he revised in 1552 and which the chapter general confirmed in 1558.

A., *Loyola and the Educational System of the Jesuits* (London 1906); Pastor, Ludwig von, *Geschichte der Päpste seit dem Ausgang des Mittelalters*, vols. i-xiv (7th-12th eds. Freiburg i. Br. 1925), English translation ed. by F. I. Antrobus and R. F. Kerr, vols. i-xx (1st-5th eds. London 1922-30) vol. xii, chs. i-ii, vol. xiii, ch. vii.

LOYSEAU, CHARLES (1564-1627), French jurist. Loyseau was bailiff at Châteaudun, then advocate at the Parlement of Paris. His works, which are highly valued, are devoted to public and private law. His *Cinq livres du droit des offices* (Châteaudun 1610) is devoted to the study of the royal administration. At the time when Loyseau was writing the Edict of La Paulette had just sanctioned the sale and heredity of legal offices, and this practise was tending to spread into the army and the other branches of the administration. Loyseau protests sharply against this method of recruiting, which weakens the power of the state and gives few guaranties to its citizens. Despite the success of this book the sale of offices continued until 1789. In his *Traité des*

seigneuries (Paris 1608), to which must be added the *Discours de l'abus des justices de village* (Paris 1603), Loyseau examines the vestiges left in seventeenth century France by political feudalism and in this connection describes the origins of the feudal system. He shows himself very hostile to the manorial justices, the evils of whose offices he had ascertained in his own functions as magistrate. Without daring to propose their complete suppression he endeavored to limit feudality to privileges purely honorific and pecuniary, depriving it of all influence in the exercise of the public power. His *Traité des ordres* (Châteaudun 1610) describes the social hierarchy of his time divided into clergy, nobility and the third estate, and its effects from the point of view of private law. In his *Traité du déguerpissement* (Paris 1597) Loyseau following the example of Dumoulin attempts to achieve the synthesis of Roman law with the various *coutumes* of the north of France. This work based on extensive historical and practical knowledge shows the progress of ideas in the seventeenth century in the direction of a codification of French law.

GEORGES BOYER

LUBBOCK, SIR JOHN, FIRST BARON AVEBURY (1834-1913), English politician, anthropologist and naturalist. Lubbock, a banker by profession, served in Parliament from 1870 to 1900, when he was raised to the peerage. He was a consistent opponent of socialism, of social legislation and of home rule, an ardent defender of the imperial policy of Great Britain, especially during the Boer War, and an advocate of free trade and parliamentary reform. His name is associated with an act for the establishment of bank holidays passed in 1871. He was influential in financial and educational circles and in municipal politics, serving as president and director of many organizations.

Lubbock's diversified scientific interests were stimulated largely by his friend Charles Darwin, in defense of whose evolutionary doctrine he was along with Huxley most outspoken. After archaeological research and studies of collections of prehistoric artifacts in the museums throughout Europe he prepared a series of monographs, later recast and published as *Pre-historic Times*

(London 1865, 7th ed. 1913), in which he revised the classifications of the Danish archaeologists by dividing the stone age into two periods, the palaeolithic and the neolithic. He later refused, however, to accept the further subdivision of the palaeolithic period suggested by Gabriel de Mortillet. He adopted an extreme evolutionary position in his approach to the study of surviving savages in his *The Origin of Civilization* (London 1870, 7th ed. 1912); this attitude made him partial to ethnological documents emphasizing the simplicity and cultural inferiority of primitive peoples and caused him to disregard more authentic contrary evidence then available. He argued with Bachofen, Morgan, Howitt, Spencer and Gillen that prior to marriage there existed an original state of sexual promiscuity, which he designated as communal marriage, but he vigorously dissented from their theory that exogamy arose as a result of conscious human effort to improve morals and to avert the dangers of inbreeding. Under the influence of McLennan he ascribed exogamy to marriage by capture, contending that capture alone could explain the origin of individual marriage by giving man a right to monopolize a woman to the exclusion of his fellow clansmen. The origin of totemism he attributed to the practise of naming individuals and later their families after animals. His evolutionism led him, in controversy with Tylor and Lang, to deny the existence of religion in primitive society.

Lubbock was a pioneer in the experimental study of animal behavior; he also made original researches in the field of botany and wrote two popular books on geology. The circulation of his sententious lay sermons on ethical questions totaled over half a million copies.

BERNHARD J. STERN

Lubbock Grant Duff (London 1924); Lang, Andrew, "Lord Avebury on Marriage, Totemism, and Religion" in *Folk-lore*, vol. xxii (1911) 402-25; Stern, Bernhard J., *Lewis Henry Morgan: Social Evolutionist* (Chicago 1931).

LUBECKI, FRANCIS XAVIER, PRINCE DRUCKI (1778-1846), Polish statesman. Appointed by Alexander I in 1816 to represent the Kingdom of Poland on the liquidation commission which was to apportion the debts and assets

of the principality of Warsaw between the Kingdom of Poland, Austria and Prussia, Lubecki secured considerable advantages for his country's treasury. In 1821 he was appointed minister of finances in the Kingdom of Poland. He reorganized public finances, reduced expenditures and improved the organization for the collection of taxes, especially indirect taxes, on which he placed particular emphasis. These measures resulted in a surplus in the first year and in almost all subsequent years of his administration. The foremost personality among the ministers of the Kingdom of Poland, he played a decisive role in the whole economic policy of the state and contributed greatly to Polish industrial development. His economic policy favored industry rather than agriculture. When in 1822 Russia adopted a protective tariff, a similar tariff was adopted by the Kingdom of Poland under Lubecki's influence, which made it possible to secure for twenty years a Polish-Russian tariff on terms very favorable to Polish industry. The resulting customs war with Prussia was settled in 1825 by a considerable reduction of the import duties on Polish grain as compared with those established by the hostile Prussian tariff of 1823. In order to increase the productiveness of the large agricultural estates, which especially at the time of the customs war were suffering from low prices and the burden of old debts, Lubecki established in 1825 a credit association which furnished the estate owners with long term credit at low rates. In 1828 on his initiative the Polish Bank was founded as a state institution to administer the public debt and to offer credit, especially on short terms, to industry and commerce. This whole activity, which contributed greatly to public welfare, was interrupted by the Polish-Russian war.

Consult: Smolka, Stanisław, *Polityka Lubeckiego przed powstaniem listopadowym* (Lubecki's policies prior to the November insurrection), 2 vols. (Cracow 1907); Radziszewski, Henryk, *Skarb i organizacja władz skarbowych w Królestwie Polskiem* (The Treasury and the fiscal organization of the Kingdom of Poland), 2 vols. (Warsaw 1907-08) vol. i, and *Bank polski* (The Bank of Poland) (2nd ed. Posen 1919); Jasiukiewicz, Stanisław, *Der landwirtschaftliche Kreditverein im Königreiche Polen, 1825-1910* (Munich 1911); Gasiorowska, Natalja, *Górnictwo i hutnictwo w Królestwie Polskiem, 1815-1830* (Mining in the Kingdom of Poland) (Warsaw, n.d.).

LUBIN, DAVID (1849-1919), agrarian reformer. During his childhood Lubin's family emigrated from Poland to the United States,

where at the age of twelve he became a full time wage earner. In 1874 he established himself as a merchant in Sacramento. This business venture grew into one of the largest department stores and mail order houses on the Pacific coast, and its prosperity enabled him to devote the last twenty-five years of his life to public welfare projects.

In the early 1880's Lubin became interested in fruit and wheat growing in California and his practical experience led him to devote himself to the problems of the farmers in his region. He fought successfully against the unregulated monopoly control of freight rates. Later he became convinced that agriculture was unduly burdened by the tariff and attempted to secure support for a bounty on agricultural exports. But the regulation of transportation rates and the attempt to make the tariff effective for agriculture were not sufficient. He centered his attention on world price making forces. His observations of the results of the activities of speculators on farm prices led him to the conclusion that there should be an international clearing house of information on agricultural crops, available to farmers of all nations. His own government offered no encouragement to his proposal and it was also rejected in England and France. But Lubin, who had a tenacity of purpose and a zeal for service which approached religious fervor, succeeded in converting the king of Italy to his cause. The International Institute of Agriculture (*q.v.*) was created at Rome in 1905, one of the first of the international organizations to promote economic cooperation, the benefits of which have been so much emphasized since the World War. Lubin was the official representative of the United States at the institute until his death.

LUCAS, SIR CHARLES PRESTWOOD (1853-1931), British administrator and historian. Lucas studied at Winchester and Oxford and became a clerk in the Colonial Office. Having acquired a vast knowledge of imperial affairs he planned a *Historical Geography of the British Colonies*, of which he himself wrote the introduction and six volumes. The object of this work, a pioneer work in the field, was "to try to give a connected and accurate account of

British colonisation, its methods, agencies and results, and of the various provinces of the British Empire." Several of Lucas' lesser writings did much to stimulate interest in colonial problems, and his scholarly work augmented and encouraged imperial sentiment in the 1890's. He held that decentralization was a means of preserving the empire and stressed the peculiar idea that the American Revolution was a blessing to the mother country since it taught a new approach to colonial problems. At the same time he looked upon the opponents of the American case in the prerevolutionary period as imperial heroes.

Lucas became assistant undersecretary of state in 1897, while Joseph Chamberlain was colonial secretary, and supported Chamberlain's imperial schemes with enthusiasm. From 1907 until his retirement in 1911 he was head of the dominions division of the Colonial Office.

For fifty years Lucas was the moving spirit of the Working Men's College in Great Ormond Street, London. He served as chairman of the Royal Colonial Institute and on its behalf edited *The Empire at War* (5 vols., London 1921-26), a history of "imperial cooperation in war time."

I. L. EVANS

Important works: *Historical Geography of the British Colonies*, 11 vols. (Oxford 1887-1911; new ed., vols. i-viii¹⁻² 1905-31); *The Canadian War of 1812* (Oxford 1906); *A History of Canada, 1763-1812* (Oxford 1909); *Greater Rome and Greater Britain* (Oxford 1912).

LUCHAIRE, ACHILLE (1846-1908), French historian. Luchaire was for many years professor at the Sorbonne, where he succeeded Fustel de Coulanges. His specialty was the history of French institutions and society in the period of the direct Capetians; that is, from the end of the tenth century to the beginning of the fourteenth. His first works in this field aimed to show the degree to which the Capetian dynasty had been a continuation of the Carolingian line, the extent to which it had undergone the influence of the feudal environment and finally to what degree it had gradually restored the monarchical principle in France at a time when a Romanistic concept of the state was tending to be revived in most of the countries of Europe, notably in the empire and in England. His *Histoire des institutions monarchiques de la France sous les premiers Capétiens, 987-1180* (2 vols., Paris 1883; new ed. 1891) was epoch making; he later completed it in his *Études sur les actes de Louis VII* (Paris 1885) and especially his *Louis VI le Gros* (Paris 1890).

Then enlarging the frame he published successively two books on the urban institutions of the same epoch, *Les communes françaises à l'époque des Capétiens directs* (Paris 1890; new ed. 1911) and a *Manuel des institutions françaises: période des Capétiens directs* (Paris 1892), which has remained a classic and which treats of all civil as well as of all ecclesiastical institutions. He then devoted himself to the history of the society itself, especially in the two studies which he contributed to Lavissee's *Histoire de France* on "Les premiers Capétiens" (vol. ii, pt. ii) and "Louis VII, Philippe-Auguste, Louis VIII" (vol. iii, pt. i) and in a series of lectures on Philip Augustus out of which issued his book on *La société française au temps de Philippe-Auguste* (Paris 1909; tr. by E. B. Krehbiel, New York 1912). His studies on Philip Augustus led him to study at first hand the correspondence of Innocent III and to publish his *Innocent III* (6 vols., Paris 1904-08), which explained the role of the papacy at the end of the twelfth century and the beginning of the thirteenth.

LOUIS HALPHEN

Consult: Halphen, L., in *Revue historique*, vol. c (1909) 110-13; Imbart de la Tour, Pierre, "Notice sur la vie et les oeuvres de M. Achille Luchaire" in Institut de France, Académie des Sciences Morales et Politiques, *Séances et travaux... Compte rendu*, vol. cxxxii (1909) 529-62.

LUCHITSKY, IVAN VASILEVICH (1845-1918), Russian historian. Luchitsky was born in the Ukraine and studied at the University of Kiev, where he was appointed docent in 1874 and professor in 1877.

From the beginning of his scientific career he was interested in the history of France, especially of French institutions. During his first sojourn in France (1873-75) he studied the religious wars, working in the archives of Paris, Nîmes, Toulouse, Lyons, Grenoble and Montauban, where he discovered new facts concerning the social and political organization of the Protestants. Thenceforth he devoted himself entirely to economic and social history, especially to the history of property. At first he studied from archive documents the system of communal property in the Ukraine. More important, however, was his work on the history of property in France in the eighteenth century. He devoted almost all his vacations to intensive work in French archives, particularly of the departments. He initiated a fruitful method, the essential feature of which was the use of statistics, which alone could furnish a complete descrip-

tion of the redistribution of property. He depicted on a vast scale the tax rolls and especially the rolls and declarations pertaining to the *vingtièmes*. Thus he was able to determine with approximate correctness the proportion of land in the possession of the various social classes for most of the regions of France in the eighteenth century. He utilized also the documents relating to the sale of national property during the revolutionary period.

Although Luchitsky was never able to synthesize, as he dreamed of doing, all his material into one great work, his published studies contained his essential conclusions, which are of primary interest for the economic and social history of France. He was able to establish for the eighteenth century that the rural property of the clergy, except in the north of France, amounted to only a small proportion of the territory; that the property held by the nobility was more extensive, varying from 15 to 20 percent; that the peasantry held a truly important portion of the land, more or less considerable according to the region but often exceeding 50 percent in the southern and central sections of France; and that the property of the bourgeoisie was far from insignificant. Thus Luchitsky proved irrefutably that peasant holdings in France do not date from the revolution, which merely emancipated their land permanently by abolishing the laws and seigniorial burdens that encumbered it and which also by the sale of national property increased its size appreciably. In the last analysis these studies show that the redistribution of property among the various social classes placed France in an altogether original situation; which distinguished it from the other countries of Europe and the consequences of which are still perceptible today.

A man of broad vision, Luchitsky did not confine himself to his special researches. He was profoundly interested in public affairs: he was a member of the municipal council of Kiev and of the zemstvo of Poltava and in 1908 was elected to the third national Duma, where he was a very active member of the Constitutional Democratic (Cadet) party.

HENRI SÉE

Important works: *Krest'yanskoe zemlevladienie vo Frantsii na kamune revolyutsii, preimushchestvenno v Limuzene* (Kiev 1900), tr. into French as *La propriété paysanne en France à la veille de la Révolution, principalement en Limousin* (Paris 1912); *Sostoyanie zemlevladienichiskikh klassov vo Frantsii na kamune revolyutsii i agrarnaya reforma 1789-93 gg.* (Kiev 1912), part i tr. into French as *L'état des classes agricoles en France à*

la veille de la Révolution (Paris 1911); "Otcuzhdenie natsional'nikh imushchestv vo Frantsii v kontse xviii vekov" in *Russkoe bogatstvo* (1912), no. ii, p. 102-24, no. iv, p. 50-78, tr. into French as *Quelques remarques sur la vente des biens nationaux* (Paris 1913).

J. Loutchitsky," and Sée, Henri, "La propriété rurale en France au xviii^e siècle d'après les travaux de M. Loutchitsky" in *Revue d'histoire moderne et contemporaine*, vol. iii (1901-02) 156-71, and vol. xviii (1913) 257-67; Sée, Henri, *Esquisse d'une histoire du régime agraire en Europe aux xviii^e et xix^e siècles* (Paris 1921).

LUCIAN (c. 120-c. 200), Greek satirist. Lucian was born at Samosata in Syria but at an early age he went to Greece and became thoroughly imbued with Atticism, acquiring his fame during the reigns of Antoninus Pius, Marcus Aurelius and Commodus. He had a quick and brilliant intellect and he achieved great success by giving public readings, which were then the fashion in all parts of the Greco-Roman world and which were often little more than *jeux d'esprit*. At about the age of forty he turned from these to the satiric dialogue with a view to becoming a moralist and pamphleteer. He found his models in the work (now lost) of the cynic Menippus of Gadara and still more in the Attic comedy of Aristophanes and Eupolis. From that time his spirit of mockery, his sparkling animation and wit took a wider range. His dialogues, true comedies in miniature, transport the reader into a world of fantasy into which Lucian frequently introduces, under the guise of fiction, men and things of his age. At times, as in the *Dialogues of the Dead* and similar compositions, he attacks the vices and passions which he encounters—greed, the insolent ostentation of the rich, ambition, decadent morals; again, as in the *Philosophies for Sale*, the *Runaways* and the *Fisherman*, he derides the vain disputes of philosophical sects, mocks their rivalries and their systems and brands the hypocrisy of the pretended teachers of morals. But it is especially his attacks against religions which continue to excite interest. In pamphlets such as the *Dialogues of the Gods*, *Zeus Catechized*, *Zeus the Tragedian*, to mention but a few of the best, he ridicules the puerility of the myths which had delighted Greece for so long. Elsewhere, as in the *Alexander the Oracle-monger* and the *Peregrinos*, he assails the false prophets or enthusiasts who impose upon the credulous or unstable. His natural frivolity, it is true, permitted him to

study nothing profoundly. Concerning Christianity, which was then spreading throughout the Roman Empire, he had only the most superficial view. The most enduring value of his work apart from its purely literary merits is that it pictures at first hand the decadence of the Greco-Roman polytheism and the entire spectacle of the society of that time.

MAURICE CROISSET

Works: *Lucianus*, ed. by Julius Sommerbrodt, 3 vols. (Berlin 1886-99); *The Works of Lucian of Samosata*, tr. by H. W. and F. G. Fowler, 4 vols. (Oxford 1905); *Lucian*, original Greek and translation by A. M. Harmon, Loeb Classical Library, vols. i-iv (London 1913-25).

Consult: Croiset, Maurice, *Essai sur la vie et les œuvres de Lucien* (Paris 1882); Bernays, Jacob, *Lucian und die Kyniker* (Berlin 1879); Helm, Rudolf, *Lucian und Menipp* (Leipsic 1906); Allinson, F. G., *Lucian, Satirist and Artist*, Our Debt to Greece and Rome, no. viii (Boston 1926); Chapman, John Jay, *Lucian, Plato and Greek Morals* (Boston 1931).

LUCKENBILL, DANIEL DAVID (1881-1927), American Assyriologist. Luckenbill studied at the University of Pennsylvania and the University of Berlin and received his PH.D. degree at the University of Chicago in 1907. From that time until his death he taught Assyrian at the University of Chicago, reaching the rank of professor in 1923. During this period he probably influenced more students of Assyrian than any other teacher in the country. His premature death prevented the publication of much important material and his only published books are *The Annals of Sennacherib* (Chicago 1924), a model for all future publications of historical annals, and *Historical Records of Assyria* (2 vols., Chicago 1926-27), a translation with elaborate commentary of the entire source material for Assyrian history, forming the first two parts of a projected series of "Ancient Records of Assyria and Babylonia." Many of his most important contributions dealing with problems of Babylonian, Assyrian and Hittite history as well as with the influence on the Bible of the Babylonian culture and especially religion are to be found only in periodical articles, particularly in the *American Journal of Semitic Languages and Literatures*. Although Luckenbill possessed a mastery of cuneiform texts and grammar and was widely interested in every problem, his chief desire was to understand the social and particularly the economic life of the ancients. His favorite course dealt with Assyrian and Babylonian economic history; he published and annotated numbers of economic documents and

valuable notes are scattered through his articles. Equally worthy of attention is his collection of Hittite treaties in the *American Journal of Semitic Languages and Literatures* (vol. xxxvii, 1921, p. 161-211). Because of his interest in economic documents which have rarely been translated or even studied by the average Assyriologist he conceived the project of an Assyrian dictionary, where each occurrence of each word in the language should appear on a separate card with full context. The work was begun by the Oriental Institute under his direction and has been continued since his death along the lines he planned. Through the material thus collected it is possible to interpret exactly the technical terminology of economic, administrative and social life. Progress is already far advanced in working out price levels, interest rates, administrative changes and the like for the three thousand years of economic and social life covered by the documents.

A. T. OLMSTEAD

LUCRETIUS CARUS, TITUS (96?-55 B.C.), Roman poet and the greatest of the Roman Epicureans. Animated by a genuine feeling for nature (*Venus alma genetrix*) and by an enthusiasm for Epicurus as the liberator of minds obsessed with religious superstitions, fear of divine ire and horrible fantasies of the world beyond, Lucretius was the true poet of Epicureanism and in *De rerum natura* gave the doctrine of the Greek master a stupendous artistic quality.

In the first and second books the poem traces the naturalistic conception of the universe according to atomism, applying, in the third, this conception to the relations between the soul and body; in the fourth to the refutation of the belief in a world beyond and immortality; in the fifth to cosmogony and the genesis of life, human society, language and civilization; and in the sixth to the explanation of the natural fearful phenomena, such as tempests, earthquakes and volcanoes. An exposition of Epicurean ethics, which the Roman Epicureans developed with great detail in connection with their theory of friendship, is lacking.

Of great importance for the history of sociological theory is the genetic theory of society and of human progress which Lucretius develops in the fifth book. The theory, which is similar to that expounded (also on an Epicurean base) in

the works of Diodorus Siculus and Diogenes of Oenoanda, holds that men were naturally stimulated through the experience of danger and misfortune to advance from their primordial savage life. It is also from natural experience that they received the suggestions for their first discoveries, such as fire, the smelting of metals, the arts and agriculture. These experiences awakened reflection; innate insatiability impelled humanity to progressive development. Need, experience, the sense of utility, the impulsion of the mind, time, all operating gradually and continuously, are the artisans of all progress, creating and developing society and justice, the family and affections, language and civilization. Echoes of these theories are found in the pages of Vergil, Horace and Vitruvius; these writers kindled the enthusiasm of the men of the Renaissance, who passed on the influence of Lucretius into modern times.

LUDEN, HEINRICH (1780-1847), German historian and publicist. Luden was born in the principality of Hanover and studied theology at the University of Göttingen. Under the stimulus of Johannes von Müller he turned to the study of history and in 1806 he began teaching at the University of Jena, where he remained until his death.

Luden is one of the most outstanding examples of a scholar who subordinated his entire scientific work to the practical needs of the day. His whole activity was animated by a spirit of national patriotism. As a publicist he edited the *Nemesis* from 1814 to 1818, the *Deutsche Blätter* from 1815 to 1816 and the *Allgemeines Staatsverfassungs-Archiv* from 1816 to 1817. He used these journals first to combat the rule of Napoleon and then to propagate his ideas of German unification along liberal-constitutional lines. His greatest influence was exercised as a teacher at Jena, where he inspired his students with a political

sense of national freedom and unity. He was also largely instrumental in the creation and spread of the *Burschenschaft* movement. Foreign students gathered around him, and his influence came to be particularly associated with the Czech national movement under Palacký. Luden's historical writings were out of date when they appeared and were not based on modern scientific criticism, but they served as a means for stirring up the people and as a tool for the unification movement. His philosophy of history was influenced by the idealist thought of Fichte and Schelling and in a sense he is a forerunner of the national political school of historians of later day Prussia.

In his economic views Luden was a critic of the individualist economics of Adam Smith. He laid more stress on ethical principles and pointed out the automatization and loss of human dignity produced by increased division of labor. In his criticism of economic conditions he was under the influence of Fichte and in his constructive suggestions he was inspired by the spirit of the old *Polizeistaat* (welfare state).

FRANZ SCHNABEL

E., "Heinrich Luden: a Pioneer of Nationalism" in *Contemporary Review*, vol. cxi (1931) 231-38; Mombert, P., *Geschichte der Nationalökonomie* (Jena 1927) p. 274-76.

LUDLOW, JOHN MALCOLM (1821-1911), British social reformer. Ludlow was born in India and educated in Paris, which was then the center of democratic ideas. He went to London

in 1838 and was called to the bar in 1843. An intimate friendship with J. F. D. Maurice and Charles Kingsley began in 1848 and with them he started the Christian Socialist movement through the magazine *Politics for the People*, of which he wrote nearly half the contents. In 1849 on a visit to Paris he studied Buchez' *associations ouvrières* and in 1850 persuaded his friends to initiate cooperative production. He planned the constitution of the movement and of its shops, and although E. V. Neale and others soon linked the work with the cooperative stores at Rochdale, Ludlow always maintained that production rather than distribution is the true starting point in any large reform of society. His full scheme was similar to that recently revived as guild socialism. As a lawyer he was able to render real service by the preparation of supporting evidence in promoting the Industrial and Provident Societies Act, which in 1852 gave legal status to cooperative societies; he followed this with other legal activities. In 1854 when his associations began to fail he threw himself into the foundation of the Working Men's College, of which Maurice was the first principal. He was made secretary in 1870 to the Royal Commission on the Friendly Societies and in 1875 became their registrar. In this capacity he was until 1891 the chief link between the government and the whole labor movement and exerted a great though anonymous influence upon the latter's development.

Ludlow was a gifted writer but not a great speaker; his knowledge of France gave him a sympathy with democracy almost unique in his generation; his energy and single mindedness made him the wisest of counselors. To no one does the progressive movement in Britain owe a larger debt. That he has never received proper recognition is due partly to his modesty, partly to his length of days. He always insisted on giving credit for his work to others; he kept studiously in the background and outlived all his contemporaries, so that on his death there was none left to do him honor. The secret of his influence was his combination of knowledge with energy and persistence and his deep and reasonable religious faith. Here he drew inspiration from Maurice; in practical and social matters he was Maurice's guide and adviser.

CHARLES E. RAVEN

Consult: *Christian Social Reformers of the Nineteenth Century*, ed. by Hugh Martin (London 1927) p. 143-62; Raven, Charles E., *Christian Socialism 1848-54* (London 1920).

LUDOGOVSKY, ALEXEY PETROVICH (1840-82), Russian agronomist. Ludogovsky studied and taught at the Gorigoretsky Agricultural Institute, where he continued as docent upon its removal to St. Petersburg in 1868. Shortly thereafter he was appointed professor at the newly created Petrovosko-Razumovskaya Agricultural Academy at Moscow.

The span of Ludogovsky's career coincided with the period of great reforms in Russia, of which the emancipation of the peasants in 1861 was the leading one. At this time questions of economic and technical organization of agriculture assumed unusual importance for the country. As a scientific investigator and teacher at a specialized agricultural college Ludogovsky exerted a direct and far reaching influence in this field. Students trained by him went out to all sections of the country as managers of estates and as technical advisers to zemstvo and other local government bodies. And his great work, *Osnovi selskokhozyaystvennoy ekonomii i selskokhozyaystvennago schetovodstva* (Fundamentals of agricultural economics and farm accounting, St. Petersburg 1875), was the first advanced study of the subject which not only dealt with the technique and management of farming but also afforded a comparative view of economic and social conditions governing the variety of agricultural forms and systems in different countries throughout history. This socio-economic point of view characterized the subsequent development of agricultural economics in Russia as distinguished from farm management and technical agronomy in western Europe. The book itself was used by several generations of Russian agronomists even when the natural scientific views expounded therein became somewhat outmoded. Ludogovsky may justly be considered one of the founders of agricultural economics in Russia.

W. KOSSINSKY

Consult: Schirkovitsch, J., "Ideengeschichte der Agrarwissenschaft in Russland" in *Weltwirtschaftliches Archiv*, vol. xxvii (1928) 104-252.

LUEDER, AUGUST FERDINAND (1760-1819), German philosopher and economist. Leuder was born in Bielefeld, Prussia. In 1786 he became professor of history at Brunswick, in 1810 professor of philosophy and history at Göttingen and in 1817 professor at Jena. He early acquired a comprehensive knowledge of the historical and geographico-statistical literature of his time, and his early works were confined

chiefly to translations of accounts of travels and of newly published ethnological works. His study of contemporary foreign writers appears to have led him to political economy. At a time when German university scholarship still held fast to the doctrines of mercantilism Lueder became with Sartorius in Göttingen and C. J. Kraus in Königsberg one of the first to represent the ideas of liberalism in Germany. His chief work in economics, *Über Nationalindustrie und Staatswirtschaft* (3 vols., Berlin 1800-04), was an elaboration of the doctrines of Adam Smith, which he illustrated with numerous examples from history and ethnography. He deviated from Smith, however, in that he emphasized the subjective nature of value and laid more stress on the significance of intellectual and moral factors in the economic development of a nation. His effective exposition of the detriments of slavery and serfdom is noteworthy. In *Über der Veredelung der Menschen, besonders der Juden* (Brunswick 1808) he warmly pleads for the emancipation of the Jews.

Lueder won a permanent place in the development of the social sciences in Germany by his *Kritik der Statistik und Politik* (Göttingen 1812) and *Kritische Geschichte der Statistik* (Göttingen 1817). At a time when *Staatskunde*, or statistics, was universally esteemed as a reliable guide to political action Lueder exposed the limited significance of statistical observations. Statistics inevitably ignores the intellectual and moral forces in society which do not lend themselves to quantitative treatment. He bitterly opposed the contemporary practise of making statistics serve the political ends of governments. Although his charges were exaggerated they were productive of beneficial results to the extent that they contributed to the cessation of government interference in German statistics.

KARL PRIBRAM

Consult: Hasek, Carl W., *The Introduction of Adam Smith's Doctrine into Germany*, Columbia University, Studies in History, Economics and Public Law, vol. cxvii, no. 2 (New York 1925) p. 78-84; Roscher, W., *Geschichte der Nationalökonomik in Deutschland* (Munich 1878) p. 619-24; Saalfeld, Friedrich, *Geschichte der Universität Göttingen* (Hanover 1820) p. 122; John, V., *Geschichte der Statistik* (Stuttgart 1884) p. 133-40; Westergaard, H. L., and Nybølle, H. C. J., *Statistikens teori i grundrids* (3rd ed. Copenhagen 1927), tr. into German by M. Iversen as *Grundzüge der Theorie der Statistik* (2nd ed. Jena 1928) p. 20.

LUEGER, KARL (1844-1910), Austrian politician. Lueger, who came of a family of Viennese petty bourgeoisie, was trained as a lawyer

and began public life as a liberal. In 1875 he was elected to the City Council and in 1885 to the Austrian Parliament. His liberalism had an anti-capitalist tinge reflecting the bitterness of his class against Viennese Jewry, whose role in the upper strata of capitalist society was quite out of proportion to its numbers. While maintaining friendly personal relations with Jews, Lueger became a violent antisemitic agitator. He founded and led the Christian Socialist party, which united Catholic conservatives, prosperous peasants and disgruntled small tradesmen on a religious, antisemitic, reformist platform and included numbers of workers inflamed by antisemitism. The defeat of the bourgeois liberal majority, with its strong Jewish backing, in the City Council, was largely due to Lueger's energetic leadership and brilliant oratory. Refused confirmation by the government four times, he became mayor of Vienna in 1897 on his fifth election. Although his plan of liberal reform of the empire's communal law failed, his administration of Vienna proved him to be more than a mere orator. Reorganizing the city economy on municipal socialist lines he succeeded in a few years in municipalizing the gas, water and street car systems, in surrounding Vienna with a belt of meadow and forest closed to building speculation and in introducing numerous measures of social reform. Definitely anti-Magyar in politics, he favored a united monarchy and cooperated with the house of Hapsburg as a loyal oppositionist; his party became the main bulwark of imperial conservatism. After being a storm center for years he became a popular national figure, regarded as the advocate of sound human understanding. Witty, undoctinaire, good tempered, inconsistent, his personality and career were characteristic of the Vienna of his day.

THEODOR HEUSS

Berlin 1923-24), tr. as *Monarchs and Men* (Philadelphia 1913) p. 269-86; Jászi, Oscar, *The Dissolution of the Habsburg Monarchy* (Chicago 1929); Kralik, Richard, *Karl Lueger und der christliche Sozialismus* (Vienna 1923).

LULL, RAMÓN (c. 1232-1315), Spanish missionary and philosopher. Lull, who was born in Majorca shortly after its reconquest from the Moslems, abandoned a courtier's life in order to help accomplish the universal dominance of Christianity, the single aim of his complicated ideology. While this included the liberation of

the Holy Land, his methods of combating Islam contrast markedly with the warlike crusading of his time; he learned Arabic and devoted himself to a thorough study of the Moslem books and doctrines. He was a constant advocate of this type of special preparation for proselytizing, the modernity of which impresses present day missionaries. In the end he adopted certain Islamic ideas and practises; Ribera and Asín Palacios have demonstrated that he was a Christian Sufi indebted especially to the Murcian mystic, Muhiy al-Din ibn-'Arabi. Lull addressed himself to the people, utilizing allegories, apologues and even graphic representations; by extensive use of the vernacular he made Catalan the first modern tongue to become the instrument of philosophy. He taught at the University of Paris and traveled extensively in Mediterranean lands, propagating his ideas or engaging in direct missionary activity.

Lull's philosophic works, which he believed were written by divine inspiration, display the characteristics of scholasticism and mediaeval science. While many of his ideas were perhaps unrealizable, the social, educational, ecclesiastical and political reforms which he advocated were on the whole not those of a fanatic. They were based on general mediaeval, Catalan and even Moslem institutions with which he was familiar, and which he sought to infuse with a Christian spirit. According to Menéndez y Pelayo, in his utopian novel *Blanquerna* (c. 1283; tr. by E. A. Peers, London 1926) Lull displays a greater practical sense than Plato, More, Campanella and other creators of ideal commonwealths: the hero becomes pope, reforms the college of cardinals in accordance with a Sufi institution and makes the papacy the instrument of universal reform and missionary activity. In the *Libre de cavayleria* (c. 1276-86; tr. by W. Caxton as *Book of the Order of Chivalry*, new ed. by A. Byles, London 1926), widely popular in the later Middle Ages, Lull finds the origin of chivalry in a species of social compact and its object in the maintenance of justice. *Liber de gentili et tribus sapientibus*, also very popular, was modeled apparently on the *Kuzari* of Jehuda Halevi in its search for the true religion through the arguments of representatives of Judaism, Christianity and Islam. While this work displays a remarkable spirit of tolerance for its age, Lull was not consistent in his deprecation of the use of force to propagate Christianity.

As author and translator he helped transmit Moslem culture to Europe; he also founded a

short lived monastery for the study of Arabic. In 1311, apparently through his influence, the Council of Vienne ordered that oriental languages be taught in several of the universities. Although his philosophic doctrines were suspected of heresy they were taught for centuries; and while their adherents have been relatively few in recent times, some have sought to make Lull the national philosopher of Catalonia. He is revered as the patriarch of Catalanian literature.

LUMBER INDUSTRY See WOOD INDUSTRIES.

LUSCHAN, FELIX VON (1854-1924), German anthropologist. Von Luschan did important work in linguistics, archaeology, physical anthropology and technology, displaying great erudition and industry. He began anthropometric field work in Lycia in 1881 and for the next thirty years collected data bearing on the natural history of man in western Asia. He measured the cephalic indices of over 1200 Jews and found their range to be from 65 to 98—a range as wide as that of the human race. This and other data adduced by him enabled him to prove incisively that the concept of a Jewish race was erroneous. By his studies in 1889 and 1890 on the inheritance of the cephalic index in Greek families of Adalia he showed that religion tends to isolate and perpetuate a physical type by demanding inbreeding and that a homogeneous type is frequently found in isolated remote mountain communities. He believed the original historic inhabitants of western Asia to have been a homogeneous melanochroid race with extremely broad

heads and with "Hittite," or beaked, noses; the Kurds, however, he regarded as a Nordic race which had maintained its purity for more than thirty centuries. In his Huxley memorial lecture in 1911 he stressed the fact that "language, religion, nationality, and race are quite distinct conceptions . . . again and again confounded by the general public and by the press."

In 1918 von Luschan published his important paper on historical contacts and convergence, with illustrations from many phases of culture, particularly from the field of technology. His conclusion was that similarities in culture are in some cases explicable in terms of historical contacts or divergences, in others by convergence. He maintained that the Egyptians had acquired knowledge of ironworking from Negro tribes rather than vice versa.

LUTHER, MARTIN (1483-1546), German religious reformer. The Reformation of Martin Luther led not only to a religious but also to a social revolution of the greatest significance and the most far reaching consequences, but these results lay entirely outside the original intent of the reformer. Luther did not proceed from a criticism of the external faults of the Catholic church and of the society governed by it (as did Wycliffe, Huss and other precursors) but exclusively from questions of the wholly personal religious experience. He was a monk, and the agonizing quest for divine grace which brought forth his new religious ideas may best be understood as a fruit of monasticism. Not the conquest and mastery of the world by Christianity, not the transformation of its culture and society by the Christian idea, not the organization of a powerful world church, is the essential intention of this monastic ascetic, but the reconciliation of

the individual soul with its God. From this arises a religious ethics of the individual which it is very difficult to broaden into a social ethics. If the question always remains only that of gaining the right emotional attitude of the individual believer to God, then the social world about us becomes proportionately unimportant. Luther recognized the world order as ordained by God or at least as enjoying His sufferance. It was therefore God's command to adapt one's self to the given conditions and acquiesce in them, only taking pains to preserve within this world order all the Christian virtues. From this doctrine arises a strong political conservatism which enjoins on the subject unconditional allegiance even toward an unjust and impious ruler, which forbids the serf to desert his master even if he be a Turk and the German peasant to revolt against his hard and unjust bailiff. In the German Peasants' War of 1524-25, it is true, Luther at first preached conciliation to both sides but then with merciless severity opposed the rebellion. His works reveal no mention of ideas of social reform. As a son of a peasant he shared the traditional economic and social views of his time concerning agriculture, industry, trade and business. His social and political views were essentially patriarchal in character. Every man is placed in his class according to his calling and must remain there; the family is the most important constituent of the state order, and the state is a sort of great family in which the Christian fathers care for their subjects as the father of a family looks after the welfare of his group.

Luther, however, was always far more than a monastic ascetic, allowing himself to drift in the world with no attempt at improving it. He looked for nothing, it is true, from external arrangements and nothing from ecclesiastical institutions, least of all from the political power of a hierarchically composed church of priests. He annihilated this church of priests and proclaimed the universal priesthood of the faithful. But despite his individualistic principles he immediately established a new territorial church. He became, despite the narrow political situation in which his church found itself engaged, a national educator in the grandest style. With the holy zeal of a prophet he set about to convert the character of mankind. This conversion should be accomplished by the "word of God," the preaching of which he felt to be his professional duty as "minister of souls" and professor. The word of God, however, involved moral demands which Luther proclaimed to the

conscience of men with full and outspoken force; absolute love in the sense of Jesus' Sermon on the Mount in place of self-seeking; and absolute, boundless confidence in God in place of self-confidence. Here Luther knows no evasion, no compromise. He knows nothing of abatement or shading off of the command to love in order to adapt it to the various earthly callings, as did the mediaeval church; nothing of a compromise between natural requirements of human importance and authority and the command of exclusive confidence in God, like the Christian humanism of an Erasmus; nothing of "natural" moral dignity and ability of mankind; nothing of a moral gradation of the various classes and professions. Even the state, or rather the ruling power, is for him simply a profession like any other, and he does not propose to withdraw his moral demands before the sphere of politics. The command of boundless love of God and of one's neighbor is no longer to be fulfilled outside the world as in the old monasticism but within the world in the daily callings of natural men; but in this it is to lose nothing of the absoluteness of its claim to importance. No earthly demands for happiness, no considerations of social or political interests, are of any importance whatsoever as against this rigorousness of duty.

Calvin starting out from similar religious ideas sought to realize this moral ideal by means of ecclesiastical dispositions, by means of the separation of a community of saints from the world and the preservation of their purity as a class with the aid of church discipline. Luther does not believe in the possibility of separating clearly from each other true and false Christians, the "chosen" and the "rejected." He knows that true Christians are few and will always be few and that Christian princes will be fewest of all. A devout prince, he says, is "rare game in Heaven." Sober and without illusions he looks at the world as it really is. It is as a whole like the heart of every individual Christian the scene of an eternal, ever seething struggle between God and the devil. But that does not discourage him. Without hoping ever to conquer the world as a whole for God or even to be able merely to rescue individual Christians definitely from the temptation of evil he takes up the struggle over the character of mankind, the struggle for God against Satan. His religion is the religion of a heroic *Willensmensch* who bears about in his own breast the contradictions of good and evil which rend the world asunder. Its greatness has been understood only by a few. Melancthon attenu-

ated it and adapted it to the requirements of natural reason. Its irresolvable internal contrarieties have filled the spiritual life of Germany with ever new tensions.

LUXEMBURG, ROSA (1870–1919), Polish German socialist and economist. A member of the proletarian party in Poland, Rosa Luxemburg fled from the Russian police to Zurich, where she studied law and economics and became a Marxist. In her doctor's dissertation, the first complete study of Polish industry, she revealed its close ties with the Russian economic structure and the resulting indifference of the Polish bourgeoisie to demands for national independence and demonstrated that the idea of an independent Poland was advocated by reactionary small shopkeepers and the ruined landed nobility. Consequently she advocated Polish autonomy within Russia rather than Polish independence as a working class demand. In opposition to the chauvinistic Polish Socialist party (P.P.S.) she helped found in 1893 the Social Democratic party of Poland and Lithuania as a branch of the Marxian Russian Social Democracy.

In 1896 Rosa Luxemburg settled in Germany,

where she soon became a leading theorist of the Social Democracy. Defending the orthodox position against Bernsteinian revisionism she maintained that capitalism despite outward appearances had entered a period of collapse, of increasing crises, wars and revolutions. The thesis of her principal economic work, *Die Akkumulation des Kapitals*, is as follows: In capitalist economy the contradiction between productive capacity and the possible outlets for products constantly increases. In a pure capitalist society (made up only of capitalists and their dependents on the one hand and of workers on the other) there would not be sufficient outlet for all goods produced; actually a portion of them must be sold to "third persons," i.e. to farmers and artisans within the capitalist country and to countries with primitive methods of production. As a result the antiquated methods are destroyed, the backward countries are annexed to capitalism and the fundamental dilemma of capitalist economy becomes more acute. The impulse to expand and to monopolize markets consequently grows stronger, and imperialism becomes the guiding principle of foreign policy. With the exhaustion of the possibilities of expansion capitalism would reach the limits of its development and existence; in reality, however, it must collapse even earlier as a result of the profound social convulsions which are stimulated by the expansion, and thus revolution must occur, leading to the victory of the working class.

On the basis of this theory Rosa Luxemburg defined as the goal of the working class the acquisition of political power by force and held that all its immediate activities must be related to that end. As a result of her experiences in the revolution of 1905–06, in which she took a leading part in Warsaw, she advocated the general strike as a revolutionary weapon. After 1907, centering her attention on militarism and the war danger, she rejected pacifist ideas as utopian and stressed proletarian mass action as the sole means of eliminating war.

From this time forward she was on the extreme left of the Social Democracy. Although she disagreed with them on organizational questions, holding that the rigid centralization in the Russian party defended by Lenin must give way to a more democratic organization, concerning all other important matters she held the same position as the Russian Bolsheviks. At the International Socialist Congress in Stuttgart in 1907 she and Lenin composed the resolution which demanded a revolutionary struggle for the over-

throw of capitalism in time of war. Immediately after the outbreak of the World War she attacked the patriotic policy of the Social Democracy and with Leo Jogiches, Clara Zetkin, Franz Mehring and Karl Liebknecht founded the Spartakusbund to arouse revolutionary antiwar sentiments in the working class. Except for five months she was in prison from February, 1915, until the end of the war. Nevertheless, she influenced the revolutionary movement, largely through writings which she smuggled out of prison. After the collapse of the empire she called for a proletarian revolution; although she was at first critical of some Bolshevik policies, in the heat of actual struggle she formulated a similar program for Germany and late in 1918 she led in founding the German Communist party. After the defeat of the Berlin workers' rising (*Spartakuswoche*), in which although she regarded it as premature she played a leading and daring role, she was arrested at the order of the Ebert government; on January 15, 1919, together with Karl Liebknecht, she was assassinated by the White soldiers in whose custody she had been placed.

D. Morrow (London 1931); Price, M. Philips, *Germany in Transition* (London 1923).

LUXURY. The concept of luxury, viewed as an excess of natural consumption or of money expenditure hedonistically desirable but morally somehow objectionable, seems to contain as its rational basis two elements from which both its historical account and its theoretical analysis must start. One, and the more relativistic, is the comparative degree of consumption and spending, not so much as between individuals as within the pyramid of social income strata and

corresponding standards of living—comparative both from the point of view of one period and from that of historical development. The second element is not thus subjective but centers on the relation of certain methods and quantities of expenditure—i.e. of the consumptive use of the national income as divided among social classes—to the methods and quantities of productive services required to guarantee that "national dividend" as the fund for individual or class expenditure.

The first economic formulation of the luxury concept appears in a naïve way to be based entirely on the former comparison, that between different periods or groups of expenditure. The taxation of the objects or procedures of luxurious consumption has aimed at two purposes, on the surface contradictory: the suppressing or limiting of this consumption and the deriving of a public income from it. (A similar contradiction occurs in public finance between protective and fiscal customs duties.) On closer inspection a good deal of this contradiction vanishes, when it is seen that prohibition and taxation of luxury tend equally to fix certain levels and standards of living, as against economic and social progress, which is tending to "level" such differences. The mediaeval prohibition or taxation of luxury, e.g. in clothing or food, in one group of society, coupled with permission and freedom from taxation in another, is of course economically equivalent to mere prohibition or taxation regardless of group distinctions in later societies stratified chiefly according to money incomes, because there the money economy alone enables the groups higher up in the pyramid to bear the burden of taxation or to evade the prohibition.

Luxury as an economic concept might thus seem to be resolved into a mere corollary of social stratification, the weapon with which "upper classes" constantly try to fix existing differential expenditures (and thereby indirectly divisions) of income or at least to slow down the rate of social imitation of "lower classes." Although a very important aspect of the luxury problem, this view by no means furnishes a complete analysis. First of all, the social structure of "demand" as the basis both of the expenditure (and saving) and to a large extent also, through cultural minimum concepts, of the production of national and class income can hardly be taken as the mechanical addition of "higher" to "lower" wants and satisfactions—an assumption characteristic of many doctrines of value inspired by utilitarian or hedonistic concepts of

"progress." Although social innovations to us inseparable from "civilization," such as the handkerchief, the toothbrush or the bathtub, are apt to be regarded as typical of the way this progress has of converting luxuries into necessities, it would scarcely be justifiable to argue further either that corresponding wants before the emergence of those innovations had not been satisfied at all or that these were a priori the only means of their satisfaction.

Thinking in systems and cycles instead of in simple progressive lines is as necessary in the study of the phenomena of luxury as in all other departments of the social sciences. Fashion is now definitely understood as a cycle of variations from long term trends of custom. In the same way luxury embodied in particular objects and practises must be taken to follow lines of descent as well as ascent. An example of an especially long term trend is the quantitative luxury of food characteristic of "natural" economies unable to cope with their surplus in kind, such as those of the decadent periods of the ancient world and even more of the late mediaeval and early modern centuries. Both the wide range and the economic and social conditioning of variations in the definition of luxury are brought out by a comparison of such periods with the precarious feeding of many primitive or stabilized civilizations and, on the other hand, with the declining taste for even qualitatively luxurious food and cooking exhibited by the modern mechanized mass society.

One might again try to establish a law of cyclical variation of luxury ideals with regard also to different social groups or classes. As yesterday's fashion of a higher or more developed (e.g. urban) group may become today's fashion of a lower or less developed (e.g. rural) group, so it may be with luxuries. Food luxury certainly lingers in rural surroundings long after it has ceased to be the ambition of urban populations, and in a very similar line of development or rotation the hoarding or even wearing of luxurious durable textiles is making room for rapid changes of quickly outworn materials and patterns. It is important, however, not to see these developments in a too rigidly irreversible outline. As it is a mistake to consider the old regional dresses (*Volkstrachten*) of Europe as nothing but the petrified remains of older aristocratic or urban dresses, so it would be fallacious to think of luxuries as ever spreading universally or as descending the social ladder until the day of the "classless society" and anticipat-

ing the latter's regardlessness of historical or geographical diversities.

The subjective and relativistic analysis of luxury becomes capable of a more objective turn with the posing of the questions: How does luxurious expenditure in certain fields or a general tendency toward it affect the national dividend, first directly through the spending and saving of the income of various groups and then indirectly through the increase or diminution of productive work or service of all kinds as the equivalent of all incomes? From either point of view luxury may be approved or condemned along familiar lines of economic reasoning. Societies seem instinctively to dread luxury as an instrument capable of tapping the roots both of conservation and of progress, menacing on the one hand, through overspending, the necessary investment funds for replacement and enlargement of real capital and on the other, through decadence, the springs of economic and social activity. The strongest and most consequential outbreak of such awareness in history has doubtless been that manifested in the ascetic frame of mind which accompanied the early rise of capitalism in modern Europe and more particularly in the famous spirit of Puritanism. In classical antiquity it had appeared most explicitly in the stoic philosophy. In most of the earlier and in a large part of the later writing on luxury there has been a confusion of ethical and economic considerations. In economic theory criticism of the role of luxury has been most impressively expressed by Alfred Marshall, whose distinction between "artificial" wants and wants creative of new activities is basic to the whole structure of his principles.

Opposite and quite as familiar views have emphasized, especially since the origin of modern economic theory in the early capitalistic age, the importance of luxury consumption—as centering, for example, in the courts of the sovereign princes and the households of their titled and bourgeois imitators—in "bringing money among the people": not only maintaining the traditional handicrafts and manufactures serving this consumption but also giving rise to many new industries either imported from abroad or developed autonomously. The social and economic aspects of luxury production were widely discussed by most of the social philosophers and social scientists of the eighteenth century. Mandeville's *Fable of the Bees* presented in allegorical form the argument that luxury production is a source of work. David Hume pointed

out the social benefit of luxury production, while the physiocrats analyzed its effects on the national economy. The mercantilistic doctrine of the balance of trade has often been interpreted as hostile to the rise of luxury trades. On the contrary, it was averse only to the importation of foreign made luxuries; and in each country adherents of the doctrine sought to foster their domestic fabrication especially for foreign markets even by means of the importation of foreign artisans and entrepreneurs, practically the only form of capital migration known to that period. It is true that mercantilistic teaching sometimes includes an inveighing against luxury without distinction between foreign and domestic products, notably in the case of the "colonial" beverages and foodstuffs so important in the age of colonial rivalry. But fundamentally this is nothing but a crude theoretical reformulation of the mediaeval ethics of consumption according to "estates." Instead of (or as well as) being morally illicit, certain standards of living are reserved to some classes and prohibited for others, because it is felt that in the case of the latter they would disturb the balance of the social economy by destroying habits of industriousness and promoting supply prices of labor disruptive of the wages market.

There can be on the whole no question as to how deeply the industrial progress of early capitalism was indebted to the ever increasing and diversified demand for luxuries, chiefly in dress but also in all spheres of an artistic style of life, exercised by the old feudal and the new moneyed aristocracy. The rise in importance of the lower middle classes in America and Europe after the World War appears to be in many respects a parallel economic phenomenon. The development of what have been called the "new industries," such as motor cars, artificial silk, cosmetics, cinema, radio and other electric machinery, together with the substitution for coarser cereal foods of daintier vegetables and animal products represents a new turning point in the mutual adjustment of technically advancing production and socially enlarged consumption, in the evaluation of which the millions of unemployed reduced to starvation are not to be forgotten. This process has already created for its own theoretical justification an economic doctrine, that of the beneficial purchasing power of high and rising wages and the corresponding dangers of saving, which has not incorrectly been likened to the early capitalistic doctrine of the usefulness of upper class luxury. The only conditions under

which either theory can hold good are also the same: first, the preservation or adaptation of the equilibrium between purchasing power created in different places or turned to new uses and the rest of the system of productive and consumptive processes forming the national economy; and, secondly, as a long time consideration the prevention of disturbances or the compensation for losses arising from the relative waste or over-refinement inseparable from luxury. As the usefulness of early capitalistic luxury was combated by the English "industrialist" economists, so the extravagance of many modern governments in incurring and encouraging expenditure for "social" purposes has begun to be severely criticized. With the older controversy still unsettled, a new epoch seems to put modern civilization before the alternative either of clinging to the capitalistic system with higher although less equalized standards of living or of embarking on a communistic planned economy with a primarily equalized although possibly very low standard.

Economic theories of both the supply of and the demand for luxury goods are bound to reflect the circumstances and attitudes implicit in the economic background of their respective periods. Both the producers of luxuries and the governments singling them out for a moderate special taxation naturally assume at first a limited but rather inelastic demand for such goods, such as that actually represented by the upper classes of a feudal society. Next governments and after them producers become aware of a growing elasticity and restiveness of a luxury demand which is on the one side harassed by taxes and on the other served by supply at decreasing costs, a condition which tends to eliminate the stimulus of rarity so indispensable to the concepts of fashion, luxury and even of value in general. It was at about this stage in the economic process that Alfred Marshall depicted the artificial wants of the rich as highly inelastic except where the craving for social distinction, growing stronger than any direct gratification of taste, makes them "almost insatiable," while the demand of the middle classes shows considerable responsiveness to rising or falling prices of "moderately expensive" luxuries and the laboring class is condemned to inelasticity at the other end of the curve. Since Marshall's time the rise of just this last class has changed conditions to a degree resulting in the introduction of the term mass luxuries (for the products of the new industries) into the terminology of the

theory of consumption. The term reflects the fact that the demand for these products has hitherto betrayed (e.g. in the ratio of expenditure to saving) something like the positive inelasticity by which Marshall defined the luxury expenditure of the upper classes. The advocates of this new mass luxury consumption can rely on an argument hardly available to the defenders of upper class luxury except in the light of an incitement to leadership and enterprise—the contribution of this consumption toward the upkeep of the physical and mental labor resources of society and of its moral and legal balance and stability. Here too the burden of proof is difficult to allot as between this view and the pessimism of those who fear the recurrence of the threat of decadence from any luxury.

One thing should be evident in view of the fact that the theory of luxury forms a special part of the more general theory of consumption. The thoroughly justified stress laid by the advance of "subjective" value theories on the empirical study of demand functions should not blind economists to the more objective conditions ruling both demand and supply of given strata of goods and services, or rather ruling the interaction of this demand and supply. If the study of static demand from price statistics is supplemented, as to longer periods, by the study of dynamic demand from family budget statistics, the latter still have to look for their ultimate explanation to the description and theory of the social and economic change governing the cycle of production and consumption over whole periods or systems. The history of luxury production in its interdependence with luxury consumption will be able to furnish valuable clues in this direction. Is or is not modern industrial and commercial mass production capable of keeping up the artistic and other cultural standards for which the aboriginal "home industry" and handicraft of so many periods and countries have been famous? How far is the proverbial "dictate" of the modern producer and distributor to the consumer encouraging or discouraging new kinds of genuine luxury? Finally, is the quick invention and spread of cheap substitutes for expensive monopolized luxury articles resulting in a mere speeding up of the race after luxurious varieties or in a slow flattening down of the social differences of consumption? The answer of history to these questions will depend in a marked degree upon the general trend of European and American culture, but it will depend also upon the development of their material

resources. To understand this relationship one need only think of the interdependence between luxury and monetary uses of the precious metals; of the constant pressure of the "synthetic" devices of the modern chemical industries on the market of pearls and precious stones; of the reorganization of modern fur production and marketing as a consequence of both the exhaustion of the old colonial areas of production and the introduction of cheaper raw materials through the refined technique of dressing and imitation.

The position of labor in luxury production has been as double edged as the economic and social meaning of luxury itself. In every country there are instances of labor, in some cases of an old domestic standing and training, exploited by middleman and commission systems, which make large profits in luxury markets. On the other hand, there is no lack of luxury industries and handicrafts which have been handed down from generation to generation of the same stock of artisans. Moreover if the production of highest or exceptional qualities of most commodities is considered as a kind of luxury level of industry generally, a regular feature of this level is seen to be the traditional cultivation of élite groups of engineers, designers and workmen, if only under the threat of possible competition, inland or foreign, for their services.

In this connection two far reaching theoretical conclusions must be drawn from the history of luxury. First, all the fine arts are in one respect parts of social luxury consumption and production; and it is only under the stress of the extreme division of labor contingent upon modern civilization that the artist has lost the consciousness of being an artist, and vice versa. The artistic interest, stimulated by the more vain-glorious sides of the capitalistic demand for works of art, has in modern times centered one-sidedly upon the real or fabricated treasures of past ages to the exclusion of much highly qualified contemporary artistic effort, which is as a result coming to be degraded into artistic handicraft or even resulting in an artistic proletariat. The ultimate outcome of this competition between past and present luxury will possibly be decided by the second factor to be mentioned—the role played by governments and other public institutions in the demand for luxury production. Democracy has necessarily turned the expenditure of these institutions, where it transcends the boundaries of the socially useful, to fields like public festivals and recreations instead

of to that display of politically "representative" splendor characteristic of the older monarchies and aristocracies. It remains to be seen whether the huge sums which nevertheless are spent for representative purposes by democratic and even more by communistic governments will add to the subjective character of public luxury the more objective and enduring values which are embodied in the great art of past religions and states.

CARL BRINKMANN

I., *Luxury as a Social Standard* (New York 1915); Urwick, E. J., *Luxury and Waste of Life* (London 1908).

LUZZATTI, LUIGI (1841-1927), Italian statesman. Luzzatti, the son of a wealthy Jewish Venetian family, became interested at an early age in the liberal reformist solution of the social problem. Charged with treason by the Austrian government for organizing a mutual aid society among the gondoliers, he fled to Milan, where he taught economics at the technical institute from 1863 to 1866. At this time he published *La diffusione del credito e le banche popolari* (Padua 1863), which marked the beginning of

his lifelong advocacy of people's banks in Italy. In 1866, when the Venetian provinces were freed from Austrian rule, he was appointed to the chair of public law at Padua; he later taught this subject at Rome from 1907 until the end of his life. In 1867 he published *La chiesa e lo stato nel Belgio* (Milan), the first of a long series of essays on religious freedom collected in *Libertà di coscienza e di scienza* (Milan 1909; 2nd rev. ed. as *Dio nella libertà*, Bologna 1926; tr. by A. Arbib-Costa as *God in Freedom*, New York 1930). These as well as specific appeals in favor of Rumanian and Polish Jews and Turkish Armenians won him international fame as a champion of religious toleration and civil equality for national minorities.

As a protégé of Marco Minghetti he was appointed in 1869 secretary general for agriculture, an unusual distinction for a man of twenty-eight. He became a member of Parliament in 1871, as soon as he attained the necessary age, and was continually reelected until 1921, when he was appointed to the Senate. He was minister of finance in four cabinets during the years 1891 to 1906; minister of agriculture, industry and commerce in 1909-10; premier in 1910-11; and minister of finance once more in 1920. A moderate liberal, he promoted a great deal of legislation dealing with industrial accidents, woman and child labor, old age, emigration, housing, vocational training and cooperation. Neither a free trader nor a protectionist, he initiated for Italy a policy of commercial treaties, no fewer than twenty-four of which he negotiated personally; the most important of them was the provisional accord with France which terminated the tariff war in 1898. A novel feature of some of them was a supplement providing for the mutual regulation of labor conditions. As minister of finance Luzzatti was responsible for considerable economies during a critical period of Italian finances and the conversion of the national debt of 8,100,000,000 lire with a reduction in interest from 4 to 3½ percent, an operation which in 1906 he carried out most successfully despite its magnitude.

LYELL, CHARLES (1797-1875), British geologist. Lyell was born in Scotland but passed most of his childhood in the south of England. At Exeter College, Oxford, he originally prepared for law; but while there he attended Buckland's lectures on geology, and the interest thus awakened in that science was further developed during a vacation tour in Europe. Two years after his admission to the bar Lyell abandoned the legal profession to devote himself to the study of geology, which had at first been merely a hobby but soon became the major concern of his life.

At the very start of his career as a geologist Lyell found himself in the midst of one of the major controversies of science. He was soon aligned with Murchison against the strong group of "catastrophists" led by Buckland and Coneybeare, who relied on the Noachian Deluge and other cataclysms of nature for their explanations of geological phenomena. In 1830, 1832 and 1833 the three volumes of the first edition of Lyell's *Principles of Geology* were published. This work had an immense influence on contemporary thought not so much because it advanced any fundamentally new ideas but because in it so many known facts of geology were analyzed and correlated. For the first time the science was presented in a thoroughly convincing and rational manner, and only those hypotheses which could withstand critical analysis were approved. It was a complete victory for "uniformitarianism," the principle that processes now in operation on the surface of the globe could and did account for all changes that had taken place in the past. This principle, first suggested by Hutton and Playfair, is basic in all modern attitudes toward earth lore and is one of the corner stones in the evolutionary interpretation of the history of life.

Although Lyell recognized the sequence of progressively higher fossil forms in the strata of successive ages he was not favorably inclined toward the idea of evolution. He criticized severely the doctrines of Lamarck, and for many years after the publication of the *Origin of Species* he withheld approval of Darwin's conclusions. Only as the cumulative evidence impressed his analytical mind were his prejudices overcome, and at last in the tenth edition of the *Principles* he announced his conversion to the doctrine of evolution. His acceptance of this devastating doctrine had great weight with his host of followers and contributed largely toward the settlement of the major scientific and philo-

sophical dispute of the third quarter of the nineteenth century.

LYNCHING and "lynch law" are terms now used chiefly to designate a particular form of mob violence as practised in the United States since the middle of the nineteenth century: a vengeful torture and execution of individuals without trial and regardless of the existence of regular courts of law. In a broader sense lynch law is sometimes employed with reference to any form of extralegal action for inflicting corporal punishment: accordingly American lynching is sometimes likened to such historic forms of private or semiprivate administration of criminal justice as the sixteenth and seventeenth century gibbet, or Halifax, law in England, the mythical Jedburgh justice of Scotland, the *Vehmgericht* of mediaeval Germany and the Spanish *santa hermandad*. The origin of the word lynch is not certain. The most commonly accepted explanation is that it derives from the name of Charles Lynch, a Virginia farmer who at the time of the American Revolution headed a small organization formed to try and punish desperadoes, outlaws and also British sympathizers.

Discussions of lynching often begin with a description of such frontier methods of administering justice in America: extralegal proceedings among the early settlers in dealing with horse thieves, wife beaters, Indian scalpers, harborers of runaway slaves and occasionally public officials accused of an abusive exercise of power; the activities in the third quarter of the eighteenth century of self-constituted standing groups, such as the Regulators in the Carolinas, the Regulars in New York and the Rangers in Pennsylvania, formed to visit speedy punishment upon robbers, brigands and loyalists; and the more systematic work in the middle decades of the nineteenth century of vigilance committees of the west in administering justice against

murderers, stock thieves, gamblers and "suspicious characters" in regions where the spread and increase of population kept ahead of the establishment of civil institutions.

It is only in a limited sense that the later lynchings can be said to be an outgrowth of these frontier practises. Although the latter were doubtless partially responsible for establishing American habits of lawless dealing with certain types of offenders, nevertheless they lacked some of the most significant features of the later lynchings. The earlier attempts to mete out justice extralegally were generally to be found only in regions where the ordinary tribunals were absent or inadequate. They proceeded according to a form of trial of their own, and they inflicted the death penalty only for the graver offenses. Contemporary lynching, on the other hand, is carried on in settled regions where the courts of law are in full operation. There is no process for establishing the guilt of the accused; the punishment is death, often accompanied by torture and other sadistic acts, applied in many instances to persons charged with offenses which according to the ordinary standards of civilization are of a minor character. This extreme form of mob violence is practised in all parts of the United States, but predominantly in the southern and southern border states and most frequently against Negroes.

The racial and sectional aspect of lynching appeared first during the two or three decades immediately preceding the Civil War. The spread of the frontier influence into the older sections and the growing bitterness of the slavery controversy combined to make social conditions at the time especially turbulent. In the south the methods of mob law were applied with increasing frequency and severity against persons charged with any sort of tampering with slavery. There were numerous instances of violent treatment—by flogging, tarring and feathering and occasionally hanging—of abolitionist agitators and persons accused of aiding runaway slaves or otherwise aligning themselves with the anti-slavery cause. After the Civil War southern Negroes became the chief objects of these extralegal proceedings. The original Ku Klux Klan played the chief role in "disciplining" former slaves both by suppressing their night maraudings and by frightening them out of the exercise of legal rights. To some extent the negligence or favoritism of the carpetbag governments in dealing with offenses by Negroes supplied the provocation for such "self-defense" on the part of the

whites, a habit which quickly developed into the practise of lynching.

There are no official statistics of lynchings, but the *Chicago Tribune* from 1882 through 1917 and more recently the Tuskegee Normal and Industrial Institute and the National Association for the Advancement of Colored People have presented annual summaries. These summaries do not agree in every numerical detail; with the lack of a precise definition of lynching there may be uncertainty as to whether a particular episode is a case of mob slaying, in alleged behalf of the community, or a case of ordinary murder or manslaughter in which several persons take part. All the summaries, however, exclude the instances of deaths in riots (even race riots) and "gang" slayings; and since in the great majority of cases there is no difference of opinion as to the presence or absence of the characteristic features of a lynching, the several summaries are in approximate agreement.

The summaries show the total number of lynchings from the early 1880's through 1930 to be considerably over 4000. According to a summary revised to 1932 by the *Negro Year Book* issued by the Tuskegee Institute 4589 persons were lynched between 1882 and 1931, 3307 of them Negroes and 1282 whites. Only the six New England states have been free from lynchings during this period. There has been a fairly steady decrease in the annual number of lynchings throughout the country since the beginning of the twentieth century, but the sectional and racial character of the lynchings has become more pronounced. For the country as a whole the average annual number of persons lynched has fallen from 154.1 for the decade of 1890-99 to 31.2 for the decade of 1920-29, so that the number of lynchings in the latter decade is slightly over one fifth the number for the earlier decade. Yet the southern proportion of the total number of lynchings has risen from 87 percent in the decade of 1890-99 to 95.5 percent for 1920-29; and the proportion of Negroes in the total number of persons lynched has risen from slightly over 72 percent in the earlier decade to approximately 90 percent in the latter decade. It is interesting to note further that the largest number of lynchings in the south have not occurred in the regions where the percentage of Negroes in the total population is highest, but in those sections where the Negroes number less than 25 percent of the inhabitants. To explain this fact it is said that in the "black belt" regions the large landowners are to a greater degree de-

pendent upon Negroes as tenants and laborers, while in the more sparsely settled regions, where the proportion of Negroes is lower, the economic competition between the poor white and Negro farmers is keener and the racial hostility between them correspondingly stronger.

A typical lynching crowd appears to be made up of younger men from the relatively poorer and uneducated families. In some instances, however, educated men of high economic and social standing participate, and frequently the lynching is approved or at least condoned by large sections of the better elements of the community. This tolerance appears in many cases to be due to a fear of the dangers—physical, economic, social—that would be incurred by any outspoken condemnation of a practise which is approved by a substantial proportion of the community.

The general causes of lynching are to be found in the frontier heritage of Americans and their pervasive disposition to hold formal law of little account when it runs counter to popular desires and prejudices, as well as in the economic and social situations already noted. The common justification offered in the south for the lynching of Negroes is that prompt, conspicuous punishment freed from the delays and technicalities of formal legal proceedings is necessary in order to protect white women from sex assaults by Negroes. This contention, which is not given much weight outside the south and is coming to be discredited by fair minded southerners, has no statistical substantiation. Concerning the total number of persons lynched from 1889 through 1930 homicide stands first among the offenses charged, covering about a third of the cases; rape stands second, at about one seventh; rape and attempted rape together stand at less than one fourth. In an overwhelming majority of the instances of Negroes lynched the charge is some offense against whites. The graver offenses—murder, rape, arson, assault—predominate; but in many cases the charges are of a strikingly trivial sort, such as slapping a white child, using offensive or boastful language, suing or testifying against a white, expressing sympathy for a lynched Negro, seeking employment in a restaurant or accepting appointment to a postmastership. The lynchings spring in part from an unreasoning fear that the Negro, differing as he does from the whites in certain marked bodily characteristics, is more brutish and that his brutishness is likely to be manifested with peculiar unrestraint against members of a race

from which he feels he has suffered indignities. Another cause of lynching is to be found in the quick and passionate resentment among large sections of the southern whites against any gesture of equality on the part of the Negro. These whites hold that their economic and social superiority is insecure unless the Negro is forced to "keep his place." They are determined that he shall remain a servant instead of a competitor. Thus the southern lynchings are manifestations of the same sort of attitude that has led to the other discriminatory measures, legal and extra-legal, against the Negro: suffrage disfranchisement, residential segregation, discrimination in the provision of educational facilities and in the processes of trials before the courts. In addition they are manifestations of a mob psychology often distinctly sadistic in character.

A description of lynching as a product of peculiar race relations in the southern states does not, however, explain the social implications of the practise. As violent manifestations of a racial antagonism mixed with economic rivalry the pogroms of czarist Russia and the terrorist activities against Jews in Germany and the states of southern Europe are in a class with lynching. Similarly the conflicts between labor and capital often give rise to what are in essence lynchings. In this connection lynching should be studied in its relation to the violent activities of the "Molly Maguires" among the Pennsylvania anthracite mine workers in the 1870's and among the western miners a few decades later; or, on the other side of the struggle, to the various attempts to cure labor radicalism by violence, as in the personal assaults and the destruction of property directed against the I. W. W. at Everett, Washington, in 1916, and at Centralia in the same state in 1918. In the attack on labor radicals the intellectual and emotional attitudes of a lynching crowd sometimes stand out clearly even when the attack is conducted through the agencies of formal law. In the criminal prosecution of I. W. W. members at Centralia in 1919-20 and of Thomas Mooney in California the groups chiefly instrumental in instigating the prosecutions and forcing the execution of the verdicts ignored the revelations that fraud and perjury played a determining part in securing the guilty verdicts; they displayed the lyncher's indifference to the absence of clear evidence against the suspected offender, the same uneasiness with regard to their own economic security, the same determination to have the group to which the accused belongs taught by the lesson of his extreme

punishment to keep to its proper station in the community.

Condemnations of lynching have in recent years issued increasingly from responsible agencies of opinion, particularly in the south. Appeals and arguments against the practise are made in the resolutions of educational and religious associations, in the editorial columns of leading newspapers and in the messages of governors. Serious studies have been instituted by the Commission on Inter-racial Cooperation, by the Records and Research Department of the Tuskegee Institute, the Commission of Southern Women for the Prevention of Lynchings and the National Association for the Advancement of Colored People. There is a growing realization of the moral and social cost of lynching and of the primary responsibility on the part of southern whites, co-operating with Negroes, to find a remedy for the evil.

Attempts to curb lynching by legislation have taken various forms. In some instances there have been legal prosecutions under the ordinary statutes against homicide, riot and assault. During the last few decades a number of states have enacted statutes aimed specifically at lynchers. The statutes contain such provisions as the following: punishment of individuals who participate in a mobbing or lynching, who break into a jail or take a prisoner from the custody of an officer or who interfere with sheriffs or other officers in the execution of orders of the courts; removal of officers who prove negligent in protecting prisoners; liability of counties in which a lynching occurs for damages to legal representatives of a person lynched; the giving to officers of the law special powers of summoning a posse to protect a prisoner from seizure; the granting the persons injured or the heirs of a person slain in a lynching a special right of action for damages against the participants in the lynching. Although these legal measures have been applied in some instances they appear to be ineffective, particularly in the regions where the remedies are most needed. Here the prosecutors are less likely to institute proceedings against the lynchers, coroners' juries are likely to decide that the victim came to death "at the hands of persons unknown to the jury," grand juries make little effort to discover evidence sufficient to convict and trial juries are unlikely to convict. The recent decrease in the number of lynchings has apparently been due chiefly to the wide public criticism of officials who are lax in their efforts to prevent a lynching. There are, however, no cer-

tain indications of a noticeable diminution of the disposition to lynch, among the elements of the population chiefly active in the practise. If the number of persons lynched is added to the number of lynchings prevented by efficient official action the annual totals have remained fairly constant in recent decades. Further legislation has been proposed for increasing the power of the state authorities to investigate and prosecute in cases of death caused in mass attacks, to order changes of venue in the trials of lynchers and to suspend officials who are negligent in protecting prisoners from seizure by a mob. It is often suggested that the remedy for lynching is to be found in more prompt, efficient action on the part of courts and prosecuting officials in dealing with crime, so that the people may feel assured that the tribunals of the law are competent to protect the community from dangerous crimes. But the remedy hardly meets the evil in its most prevalent form, for the negligence of public officials is displayed least in the cases of offenses of Negroes against whites. In many instances moreover persons have been lynched after their prompt conviction by the regular courts. In view of the ineffectiveness of existing state measures and in order to secure the intervention of officials whose tenure of office is relatively independent of local sentiment there have been numerous proposals for federal legislation against lynching. Typical of these is the bill prepared by Representative Dyer of Missouri and introduced in Congress in 1920 and again in 1921. It was passed by the House in 1922, but defeated in the Senate. The Dyer measure provided for fine or imprisonment of officers proved negligent in their efforts to protect prisoners from seizure, fixed a heavy liability in damages on a county in which a lynching occurred and imposed prison sentences on private individuals participating in a lynching. The constitutionality of any such federal legislation is in doubt, inasmuch as control of lynching could hardly be brought within the scope of any of the enumerated powers of Congress. To say that Congress may intervene positively either in punishing state officials who neglect to protect life, liberty and property or in punishing the attacks by private individuals whom the state neglects to punish would require a novel and unusually strained interpretation of the power of Congress to enforce that clause of the Fourteenth Amendment which forbids a state from depriving a person of life, liberty or property without due process of law.

It is generally agreed that all legislative

measures can at best be of only incidental and supplementary effect unless they are accompanied by changes in the racial attitudes, economic conditions and moral standards which give rise to or tolerate lynching and until the practise is outlawed by public opinion. Recent pronouncements against lynching give primary consideration to the problem of elevating generally the social and economic position of the Negro and of improving the relations between Negroes and whites; and they direct attention to the harmful consequences of lynching in debasing the reputation of the United States, particularly the south, in the eyes of the world at large, in brutalizing those who come under the influence of the practise and in promoting a general disrespect for law, order and basic human rights.

LYON, MARY (1797-1849), American educator. Mary Lyon was born in rural Massachusetts, where she attended the district schools and began to teach at the age of seventeen. She continued to teach and study alternately, and it was during this period that she acquired the intense religious convictions which made her the most pious of all early American woman educators. In 1828 she and Zilpah P. Grant opened at Ipswich, Massachusetts, a seminary for young women which was to have educational standards equal to those of men's colleges. Her long held ambition to provide a liberal and thorough English education for girls who had neither the money nor the desire to attend the expensive and poorly staffed academies of the day came to fruition when she opened Mount Holyoke Female Seminary under great difficulties in 1837. She never took an interest in the broader problems of women's rights; her aim was to

assist young women "who were struggling to gain an education against discouraging odds" and to "prepare young ladies of mature minds for active usefulness, especially to become teachers." Her school was also designed to further religious conversion and to encourage missionary activity. A feature of the consistent principles which she adopted for the seminary and against which there was much opposition was the performance of all the domestic work by the students and teachers during the school's early struggle for permanent existence.

Mary Lyon's remarkable mental power was revealed as student, teacher and administrator; her ideas were carried out with striking success in the school she directed until her death. To the influence of the Mount Holyoke Seminary, later Mount Holyoke College, may be traced the establishment of other institutions for the higher education of women.

MABILLON, JEAN (1632-1707), French ecclesiastic and historian. Mabillon was born in the village of Saint-Pierremont in Champagne, distinguished himself as a scholar at the diocesan seminary and took the monastic vows in 1654. He injured his health by overapplication and was sent for change of air from abbey to abbey, where he was set to unintellectual offices. His unquenchable love of study, which was unmixed with motives of personal ambition and which was never allowed to conflict with his religious duties, was at last given scope when in 1664 he was transferred to Saint-Germain-des-Prés at Paris.

Although the seventeenth and eighteenth centuries were a period of general decadence for French monasticism, yet by reaction they pro-

duced a remarkable group of reformed abbeys, the congregation of Saint-Maur, which has made the name Benedictine proverbial for laborious and disinterested scholarship. Saint-Germain stood at the head of this congregation; with its dependent abbeys it formed a sort of new university at a time when the study of history even on the ecclesiastical side had never yet been taken seriously by any of the older universities. By their editions of the fathers and of mediaeval writers and even more perhaps by their production of aids to study, such as *L'art de vérifier les dates* (Paris 1750; 3rd ed., 3 vols., 1783-87), the immensely expanded edition of Ducange's *Glossarium* (6 vols., Paris 1733-36), the *Gallia christiana* (16 vols., Paris 1739-1877) and the *Histoire littéraire de la France* (vols. i-xxxvi, Paris 1733-1927), they laid foundations for the study of church history and of mediaeval history in general which remain firm to the present day. Even Mabillon's stupendous industry and wonderful memory and judgment could not have carried him through the works which stand in his name without much collaboration with his juniors, as he himself had collaborated with his contemporary Luc d'Achery. His *De re diplomatica* (Paris 1681, and supplement 1704) is not only a work of great extent but it also laid for all time secure foundations for the accurate testing and the study of mediaeval charters and similar documents. His *Acta sanctorum ordinis S. Benedicti* runs to nine folio volumes (Paris 1668-1701), his *Annales ordinis S. Benedicti* to six (Paris 1703-39); in each case the last volume was completed and brought out by a colleague after his death. Brief but equally masterly is his *Traité des études monastiques* (Paris 1691). His little book on the worship of unknown saints (*Eusebii romani . . . epistola de cultu sanctorum ignotorum*, Paris 1698; tr. into French, 1698) was condemned at Rome for its freedom of criticism and tolerated only in a second softer edition which appeared in 1705 (French translation, 1705). Mabillon stands unapproached at the head of all monastic historians.

MABLY, ABBÉ GABRIEL BONNOT DE (1709-85), French historian, moralist and political philosopher. Mably's secretaryship at court between 1741 and 1748 gave him an insight into affairs of state and intensified his moralistic aversion to political corruption and to luxury. After the appearance of his *Droit public de l'Europe* (2 vols., 1746), which was based upon a digest of available international treaties from 1648 to 1748 and which became a standard work throughout Europe, he was ranked with Grotius and Pufendorf as an authority in international relations. In his retirement he then began to produce a number of works, most of which were oriented about the purpose of ameliorating the contemporary evils of France but which carried him into widely ramified branches of social and political philosophy. While Rousseau's claim to have influenced him cannot be substantiated, his works plainly reveal his intimate acquaintance with the thought of Plato, Cicero, Locke and his brother Condillac. He was firmly convinced that psychology, ethics and politics were all different aspects of natural law; and the first dictate of natural law, according to his rather arbitrary assumption, was equality. Denying the validity of the social contract he deduced from his belief that men were equal in their fundamental make up the premise that they should also be equal in society; he further insisted that political and legal equality had no meaning without an approximation to economic equality. Mably cannot, however, be classed as a communist, although he is frequently so regarded and although he actually inspired Babeuf. He believed communism to be the ideal system and posited the possibility that it had existed in the primitive state of man. But a quality of realism and an inclination toward the evolutionary standpoint prevented him from espousing any political system which failed to take full account of human nature and of the peculiar history and customs of the peoples concerned. In the masses, whom he considered corrupted by centuries of poverty and unnatural environmental conditions, he had no faith; when he came to make practical proposals, he tended to be moderate. Through certain aspects of his thinking, such as his humanitarianism, his conviction that private property was the root of all social troubles and his reiterated principle that property was not a right but a state given privilege and might justly be restricted, he has points of contact with modern socialism. He did not, however, understand the implications of state ownership. Sump-

tuary and agrarian legislation, the restriction of industry and commerce, and inheritance laws were some of the devices which he recommended as means to bring about a more equitable distribution of property. He also advocated the dissemination of education and the establishment of a more humane legal code. In his consideration of actual political reforms he showed himself something of a prophet; thus in his sketch of a new constitution of France to establish what he called a *monarchie républicaine* he sounded warnings of possible dangers which appear valid even today, and in his *Des droits et des devoirs du citoyen*, written as early as 1758, he predicted the revolution and its stages with a remarkable prescience of the still distant events. His *De la législation* (1776), a work of practical political insight, was not without effect in concentrating public attention on the calling of the Estates General. While his general importance in the formation of revolutionary opinion cannot be accurately estimated, it is certain that he was in his own time classed with Rousseau and that his opinions were frequently solicited both before and after the revolution. Robespierre went to him for inspiration. He analyzed several constitutions; in 1770 he accepted an invitation to frame a constitution for Poland. Mably also gave much attention to history, his attitude toward which plainly reveals his leaning toward moral didacticism; in the eighteenth century his *Observations sur l'histoire de France* (2 vols., 1765) was a standard work.

MABUCHI, KAMO (1697-1769), Japanese historian and language reformer. Mabuchi was the son of a Shinto subpriest of a small shrine in the province of Totomi. He first studied Confucianism but in 1733 he came to Kyoto and be-

came a disciple of Azumamo Kada (1669-1736), the founder of the new movement for the study of the Japanese classics. He succeeded to the master's mantle as the leader of the new movement and in 1738 came to Yedo (Tokyo), where he established a school and attracted many disciples.

Mabuchi with Motoori and Hirata represents that group of Japanese scholars who inaugurated the renaissance of the ancient Japanese language and culture and freed Japanese civilization from its domination by Chinese and Hindu influences. Mabuchi urged the study of the old *Manyōshū* and *Kojiki* and attacked the current view that these were only "for the amusement of women." He sought to find in these ancient writings the essential ideals of Japanese religion and morals. The Chinese philosophy, he maintained, was responsible for the continual state of civil war in China and was for this reason to be cast aside. The introduction of Chinese morals and luxuries into Japan also led to the widening of the gulf between the emperor and the people. Mabuchi emphasized the reverence and obedience owed the former by the latter, although he did not carry the point to its logical conclusion by placing the emperor above the Tokugawa shogunate. The movement which he inaugurated, however, later developed along its logical line and culminated in the creation of new loyalty to the emperor and in a strong nationalism born of the consciousness of the unique culture and life of the Japanese race.

MCADAM, JOHN LOUDON (1756-1836), British road builder. Although not an engineer McAdam did more than any other man of his time to make highway traffic quick, comfortable and safe from accidents as well as less destructive of draft animals. As a local road trustee and against prejudice and opposition he began road making experiments at his own expense, of which over £5000 was later repaid him by the government. At that time British roads were for the most part mere tracks often worn into ditches and unusable in bad weather. McAdam perfected a process of road making since known as "macadamizing," the essential feature of which is the use of uniformly small broken stone, which is rolled in successive thin layers so that it consolidates by its own angles, without binding

material, into a smooth, impenetrable surface. In addition he carried on an extensive campaign for better roads in the interest of commerce and advocated combining the hundreds of hostile parish road trusts into unified authorities headed by a higher type of road commissioner. He was constantly consulted by local bodies and in 1816 was placed in charge of the turnpikes around Bristol. Parliamentary inquiries in 1819 and 1823 served to spread his views, and his appointment in 1827 as surveyor general of roads for Great Britain put his methods and ideas into general practise. In the construction of roads McAdam commonly hired unemployed workers in the parishes, using women and children for breaking stone; pauper labor he opposed on the ground that paupers of long standing could or would do very little. He wrote two books to promote his ideas, *Practical Essay on the Scientific Repair and Preservation of Public Roads* (London 1819) and *Remarks on the Present System of Road Making* (Bristol 1816, 9th ed. London 1827). To McAdam's efforts was mainly due the development of the fine network of mail coach ways which met the needs of expanding industry and commerce in the early days of the factory system and contributed greatly to England's rapid economic advance before the era of the railways.

MACANAZ, MELCHOR RAFAEL DE (1670-1760), Spanish statesman and jurist. Macanaz, who was born in the province of Albacete of a family of the lower nobility, studied law at Salamanca and became a practitioner. On the death of Charles II he aligned himself with the Bourbon party, and his whole subsequent career was devoted to the pursuit of a political ideal identified with the historic role of the Bourbon dynasty in Spain. To this ideal he dedicated all his energies as well as his literary works of erudition and jurisprudence. When Philip of Anjou, grandson of Louis XIV, ascended the Spanish throne, Macanaz concentrated upon the task of adapting to Spain the centralized system of government existing in France. The politico-administrative privileges in the regions then enjoying autonomy were suppressed, the more important being abolished entirely and those of secondary significance being reduced in scope to the mere preservation of institutions of civil law and the like. A new method of government

and administration of justice was introduced in Valencia, Aragon and Catalonia, Navarre alone being spared this political assimilation in return for the loyalty with which it served Philip V in the War of the Spanish Succession. Macanaz also prepared a project to reduce the Court of Inquisition to an instrument whose activities should all be initiated and controlled by the king; and he advocated a policy regarding relations with the Vatican, known as regalism, which would lead to strong civil intervention in the affairs of the church. He failed for the most part in the last two undertakings, and the influence of his enemies was sufficiently strong to secure his retirement from public affairs.

MACARTHUR, JOHN (1767-1834), Australian agriculturist and pastoralist. Macarthur went to Australia as an ensign in the New South Wales Corps in 1790 and was granted land at Parramatta in 1793. He took a prominent part in the political affairs of the colony, frequently in conflict with the authorities; but more important was his contribution to the economic development of Australia. Macarthur realized that Great Britain would not continue forever to subsidize New South Wales, and certain breeding experiments led him to conclude that fine wool might provide an article of export which would give the colony a means of self-support. If grown on free or cheap land it would bear the small expense of convict labor, and it would incur low freight charges as back loading on returning transports which at that time went empty to China to load cargoes of tea. Australian wool could thus replace diminishing Spanish supplies on British looms. To develop the right wool bearing sheep Macarthur obtained merinos, first of the Escorial type introduced from Cape Colony, and later of the Negretti type from the royal stud at Kew in England. The results of his breeding activities won full recognition by 1822, when he was awarded two gold medals for having exported to Britain "fine wool equal to the best Saxon merino." This meant that Australian

wool could reach a standard well above that of "the best piles of Old Spain." The full fruit of his activity came when a way was discovered over the Blue Mountains in 1814 and it was found that merino sheep would thrive in the vast inland plains thus opened for settlement. The export of wool was greatly favored by the removal of British protective duties on colonial wool in 1825. In turn cheaper raw materials strengthened the export of British woollen manufactures. There was an influx of capital into Australia and a rush of settlers to obtain land for sheep runs. "Assigned" convicts herded the sheep. Macarthur's foresight thus resulted in the foundation of the wool industry, which remains the principal support of Australian economy. It transformed Australia from what was essentially a number of penal colonies to an important factor in the economy of the British Empire and it paved the way for the long dominance of the pastoral interests in Australian political life.

MACARTHUR, MARY REID (1880-1921), British labor leader. Mary Macarthur's career epitomizes the history of the woman movement from the beginning of the twentieth century to the post-war period, as she was in the forefront of its industrial and political battles and had a large share in shaping its policies. Although she was the daughter of a well to do merchant she became interested in the labor movement at an early age through the Shop Assistants' Union in Glasgow. Her enthusiasm amounted almost to a religious fervor, and while she was still only twenty-three she was made secretary of the Women's Trade Union League in London. At that time women's labor was very ill paid, working conditions were often appalling and except in the cotton industry little had been achieved in organization, women being frequently excluded from the existing unions. Mary Macarthur was opposed to a permanent separation of men's and women's organizations, but she met the immediate necessity of holding together scattered and poverty stricken groups of women workers and giving them some bargaining strength by working toward the formation in 1906 of the National Federation of Women

Workers, a general union open to all women in unorganized trades or not admitted to their appropriate unions. In the following years she effectually used the new federation in the struggle to establish trade boards to set minimum wages in the sweated trades and in the great strikes to enforce the Trades Board Act of 1909 and later to extend its scope. The federation helped also to secure for women the full benefits of the National Insurance Act of 1911 by becoming an approved society for its administration.

When war broke out in 1914 the growing importance of the women's labor movement was recognized by the appointment of Mary Macarthur as secretary of the semi-official committee of women of all classes and all parties formed to deal with the serious problem of unemployment. When this gave way to the problem of replacement of men by women, she served on the Labour Supply Committee of the Ministry of Munitions, where she fought for equal pay for equal work and backed the men's demand for restoration of trade union conditions, at the same time fostering an extensive organization campaign of the N. F. W. W. In 1918 Mary Macarthur represented the new political status of women by standing for Parliament as a Labour candidate. The following year she accompanied the British delegation to the International Labor Conference in Washington, D. C., and took an active part in the drafting of the convention on the employment of women before and after childbirth. Later she effected the amalgamation of the N. F. W. W. with the National Union of General Workers and planned that the remaining functions of the Women's Trade Union League be handed over to a women's section of the new General Council of the Trades Union Congress, thus completing the recognition of women's place in the regular labor movement.

MACAULAY, FIRST BARON, THOMAS BABINGTON MACAULAY (1800-59), English historian. A faithful Whig in Parliament, an able civil servant in India, a remarkable orator although never a ready debater, an efficient cabinet minister, Macaulay is important chiefly as a writer of history. In his articles in the *Edinburgh Review*

(for example, that on Clive, on Warren Hastings, on Hallam's *Constitutional History*, on Ranke's *History of the Popes*) he virtually invented the historical essay, in which the subject is but a starting point for a condensed, vivid narrative or description centered on a limited topic. From 1825 to about 1840 these essays were Macaulay's main literary effort and they gave the *Edinburgh Review* new life. Thereafter until his death he devoted himself to his great *History of England*, which, planned to extend from 1685 to about 1820, was actually published in five volumes (1848-61), extending to 1702. The *Essays* and the *History* sold in the author's lifetime like popular fiction and still have a steady sale. His continued popularity depends more on his ability to tell a story than on the now outmoded splendor of his style. In critical use of sources, in professional technique generally, his standards were high.

Although Macaulay was more than an annalist and his famous chapter on England in 1685 is genuine social history he lacked the critical and synthetic interests of the modern sociological historian. He had indeed no capacity for philosophical generalization and never attempted scientific generalizations. The *History* is a unity, not merely because its author was an artist but also because he was a Whig. For him the Revolution of 1688 was an unmitigated good fortune such as only a sturdily virtuous, clean, strong and unthinking people like the English could have deserved. Although generally fair he could turn on enemies of these Whig values and sometimes on enemies of other, more humane values in a genuine, almost intellectual passion and be notably unfair—as he was to Bacon, to Marlborough and to Impey.

Macaulay may have increased professional historical interest in English social history; otherwise his influence on academic historians, with such a notable exception as the Trevelyan family itself, has been largely negative. Shocked alike by his popularity and his rhetoric, they have withdrawn to the composition of graceless monographs. Macaulay was the last great English historian to whom history was an unsullied art, who wrote of England recognizably as had Homer of Troy. On laymen he has exerted a great influence through his part in building up the mythical, symbolic side of English nationalism.

Macaulay and his writings form in a hundred ways an excellent source for the historian of nineteenth century opinion; when he contrasts

the small and unprogressive England of 1685 with the great and growing England of the industrial revolution, he is that rare person, the articulate man in the street. His most important official action was an expression of the same mind: his minute on education written in 1835 when he was on the Supreme Council of the governor general of India poured a shower of contempt on Indian thought and literature and was instrumental in crystallizing the government's educational aims as to the Europeanization of the natives, linguistically and otherwise.

MCCORMICK, CYRUS HALL (1809-84), American inventor, manufacturer and philanthropist. McCormick was the son of a Virginia farmer and had little schooling. In 1831 he invented the first practical reaper. In 1847 he moved to Chicago, where he established a factory, dispensing with submanufacturers; thenceforward either alone or in partnership with his two brothers he outdistanced all competitors, and by 1884 was selling over 50,000 machines a year. His wealth was largely derived from investments in manufacturing, railroads and Chicago real estate rather than from his various patents.

During his lifetime many inventors contributed to the evolution of his original invention from a self-rake reaper to an automatic twine binder. These and other new agricultural implements played a large role in the rapid increase of grain production after 1850. McCormick adopted characteristic methods of modern mass production even before the Civil War: raw materials were processed according to an ordered factory schedule through the use of belt conveyors; output was standardized and any purchaser could buy parts for replacement. His efficient and world wide agency system, his large scale advertising policy, his absolute guaranty of satisfaction to the purchaser and his long term credit plan, enabling farmers to pay for a

machine from profits gained by its use, were uncommon in their day.

After 1860 competition between makers of harvesting machinery greatly increased, reaching a climax about 1878 in the "binder war," in which a dozen large manufacturers were involved. The McCormick-Deering rivalry was the most acute. The course of the struggle was marked by patent lawsuits, patent and twine pools, rebates from railroads, the breaking of price fixing agreements, and ruthless sales methods. In 1902 after several abortive attempts to consolidate the McCormick, Deering and three other firms combined with the aid of the house of Morgan to form the International Harvester Company, capitalized at \$120,000,000 and in control of the industry.

McCormick was influential in Democratic politics and liberally aided Presbyterian seminaries and colleges in Illinois and Virginia.

MCCULLOCH, JOHN RAMSAY (1789-1864), British economist. McCulloch, a Scot by birth, studied law but found in economics a less dismal career. In 1818 he began his two years' editorship of the *Scotsman* and his twenty years' collaboration in the *Edinburgh Review*. Going to London in 1820 he made intimate contacts with the reigning school of classical economists. In 1828 he was made professor of political economy in the newly established University of London but resigned the privileges of the unendowed chair in 1832. From 1838 until his death he was comptroller of the stationery office.

McCulloch's place in the development of classical economics is definitely that of a disseminator. An encyclopaedic compiler and historian of economic development and thought, he produced three statistical and descriptive surveys of the past and present resources, industries and institutions of important countries. He also delved into the history of commerce, maritime law, money, interest and property in land. Besides numerous collections and editions of English economic tracts and a classified catalogue of the literature of political economy he has left sketches of the life and writings of Quesnay, Smith and Ricardo and editions of the *Wealth of Nations* (1828) and Ricardo's *Principles* (1846). In editing the former he endeavored "to make the reader aware of the fallacy or insufficiency

of the theories which Dr. Smith has sometimes adopted"; but the principles expounded by Ricardo, whose confidence he enjoyed more than any other man with the possible exception of James Mill, he accepted with little attempt at amendment. McCulloch's *Principles of Political Economy* (Edinburgh 1825, 5th ed. 1864), one of the most widely used manuals prior to the publication of John Stuart Mill's *Principles*, was essentially a reproduction of the orthodox ideas. On only one or two points is he to be credited with doctrinal contribution. He was practically alone among the classical economists in calling attention to the importance of consumption and clarified the Ricardian conception of capital, defining it as accumulated labor and thus dignifying the payment of interest into a payment for work. Labor, on the other hand, he declared to be a species of capital. Careless passages of similar import inflamed the labor writers of the time, while they illustrated the utility of economic science for the governing classes.

McCulloch is of historical interest as a captain in the ranks of the economists who played an important part in making England a free trade country and as an adherent of the wages fund doctrine in perhaps its most uncompromising form. Unlike many of the other secondary economists, however, he regarded the doctrine not as an antidote to unionism but as the keynote to the improvement of the laborer's condition. He favored unionism as the natural counterpart, in a competitive society, of capitalistic companies and combinations, its effect being to assure the workers the wages to which competitive conditions entitled them. On nearly every important contemporary issue McCulloch leaped into print, presenting what we would now consider the orthodox classical views, although in later years he seems to have moved with the tide and to have approved of a measure of social control. For a time he lent his influence to Francis Place's propaganda for birth control but withdrew when challenged by the respectable elements. At a time when economics was probably at the height of its prestige he was one of its shining lights. But he has not left his mark upon the science, and it is probable that his reputation will depend increasingly upon his work as one of its early historians and upon his statistical and historical compilations.

MACDONALD, ALEXANDER (1821-81), British labor leader. Macdonald was more responsible than any other man both for building up national trade union organization among the miners and for securing them legislative protection. He began to work in a coal mine at the age of eight, entered Glasgow University at twenty-five, became a mine manager, achieved financial independence through speculation and retired in 1855 to devote himself to the miners' interests. He organized the Scottish miners, largely through demands for abolition of payment of wages in truck, and stimulated reformation of the county unions in the north of England which had recently broken up after the collapse of the earlier national union. Macdonald also advocated legislation to improve health and safety in the mines, including demands for employers' liability, and to protect the miners' wages against deductions by dishonest weighing of their output. This led to the Mines Regulation and Inspection Act of 1860 and later amending acts, under which the miners secured the right to appoint their own checkweighman.

In 1863 Macdonald organized a Miners' National Union, of which he was president until his death. It grew greatly and was chiefly responsible for securing the passage of the Coal Mines Regulation Act of 1872, the foundation of modern British mining legislation. Meanwhile in conjunction with Alexander Campbell of the Glasgow Trades Council Macdonald had begun an agitation against the Master and Servant Law, under which hundreds of miners were sent to prison for breach of contract every year and which was drastically amended as a result of the agitation. As part of this campaign the first

national Trade Union Congress met at Glasgow in 1864; out of this arose the permanent Trades Union Congress. He played a leading part also in the struggle for legal recognition of trade unions and in the political reform movement which led up to the enfranchisement of the urban workers in 1867. Macdonald was chairman of the Trades Union Congress Parliamentary Committee in 1872-73 and an active member of the Labour Representation League; in 1874 he was elected member of Parliament for Stafford, retaining the seat with Liberal support until his death.

Macdonald believed in parliamentary rather than industrial action, in conciliation and arbitration rather than strikes, and was opposed to the creation of a centralized miners' industrial union. This led to a split in 1869, when nearly half the organized miners joined the Amalgamated Association of Miners, led by Thomas Halliday, which advocated an energetic strike policy. This body collapsed in the great depression of the later 1870's; the depression also seriously weakened the National Miners' Union, which fell to pieces after Macdonald's death. National organization was started afresh by the Miners' Federation of Great Britain in 1888. Macdonald's policy, however, continued to influence the British miners, who still lay great stress on social legislation and direct representation in Parliament, although they have broken with the Macdonald tradition in their militant strike policy.

G. D. H. COLE

Consult: Cole, G. D. H., *A Short History of the British Working Class Movement, 1789-1925*, 3 vols. (London 1925-27) vol. ii; Webb, Sidney and Beatrice, *The History of Trade Unionism* (rev. ed. MACDONALD, SIR JOHN ALEXANDER (1815-91), Canadian statesman. Macdonald was born in Glasgow and was brought to Canada in 1820. He was called to the bar in 1836 and in 1844 he was elected to represent Kingston in the Legislative Assembly of Canada. In 1854 he was largely instrumental in bringing about the coalition of factions resulting in the creation of the Liberal-Conservative party, which remains one of Canada's major political parties. He took the leading part in bringing about in 1867 the confederation of Nova Scotia, New Brunswick and Upper and Lower Canada, and it was upon his initiative that the dominion was

extended by 1873 to include the Hudson's Bay Company's territories, British Columbia and Prince Edward Island, thus covering the entire northern part of the continent from ocean to ocean. He was himself in favor of a strong legislative union, and the element of strong central control in the federal constitution owes much to his influence. He was the first prime minister of the new Dominion of Canada and continued to fill this office until his death, except for the interval from 1873 to 1878. His defeat in 1873 was the result of charges of political corruption in connection with the charter for the building of the Canadian Pacific Railway, and it was thought that his eclipse on this occasion would be permanent. But in 1878 he came back to power on the "national policy" of high protection, a program which Canada has followed without radical changes from that day to this. During the remaining years of his life he proved invincible at the polls.

Macdonald had not in some respects an ideal code of political ethics. Although there were some points on which he knew no compromise, such as the preservation of law and order and the continuance of the British connection, in general he raised opportunism almost to the level of a political principle. It may, however, be doubted whether in the state of political morality then prevailing in Canada a statesman of stricter views could have guided the new nation more successfully than he did. He was a past master in the art of managing men, and in many ways the Dominion of Canada today is the creature of his statesmanship.

MCDUFFIE, GEORGE (c. 1788-1851), American political leader. Although a native of Georgia McDuffie passed most of his adult life in the public service of South Carolina, serving as member of the state legislature from 1818 to 1820, as member of Congress from 1821 to 1834, as governor from 1834 to 1836 and as senator from 1842 to 1846. Like other statesmen of his group he began as a loose constructionist, but when in the period following 1820 the divergent economic development between north and south became marked he joined the strict constructionists. He denounced the "American System" as presumptuous in name, fallacious in principle and repugnant to the constitution. He opposed federal activity in internal improvements, except where military or postal needs were clearly served. His chief claim to distinction rests upon the relentless course he pursued in opposing the aggressive protective policy of the majority. His views on the tariff are best set forth in his speeches of 1824, 1830 and 1832 and in the report of the Ways and Means Committee on the tariff bill of 1828 (United States, Congress, *American State Papers*, Finance, vol. v, 1859, p. 944-58). Ignoring the most obvious cause of agricultural distress in the southern seaboard states—the opening of new cotton producing areas in the southwest—McDuffie became the chief spokesman of those who found sufficient explanation of the depression in the burden imposed by the protective system. This burden was the more galling because it was believed to be in defiance of the constitution. Starting with the doctrine that imports are paid for by exports he arrived at the conclusion that a tax on imports was virtually a tax on exports and that these, consisting in the main of cotton, tobacco and rice, bore the burden of taxes levied to promote manufactures. His "export tax" theory, set forth with great ingenuity and eloquence, gained wide acceptance in his state. He was one of the boldest advocates of nullification, not as a constitutional but as a revolutionary right. He had no constitutional scruples about the second bank and broke with his party chief on that issue by acting with the bank party. He was a staunch defender of slavery as a beneficent patriarchal institution, more humane than the wage system as it was developing under factory conditions (Message of 1835, abridged in *American History Leaflets*, no. 10, 1893). No collection of McDuffie's writings has been made and no adequate biography of him has been written.

MACEDONIAN PROBLEMS. *See* COMITADJI;
NEAR EASTERN PROBLEM.

MCGEE, THOMAS D'ARCY (1825-68), Canadian statesman and publicist. As a youth McGee emigrated from his native Ireland to the United States, where he engaged in journalism. He returned to Ireland in 1845, became associated with the Young Ireland group and shared their intensely idealistic nationalism. In 1848 he participated actively in a futile insurrection and then fled as a fugitive to the United States.

During the next nine years in newspapers which he edited successively in New York, Boston and Buffalo he defended the interests of the Irish immigrants against the attacks of the Know-Nothings. When he moved to Montreal in 1857 he found the cause that was to absorb his energies throughout the rest of his life—the establishment of a united British North America—and started the *New Era*, the first newspaper in the colonies dedicated to this purpose. Within its columns he emphasized the broad spiritual benefits of nationalism as the Young Irelanders had done and drew an inspiring picture of a new British nation, sharing with the United States the life of the continent, which would result from union. He carried on his crusade in the Canadian legislature first as a member of the Reform and later of the Conservative party. The outbreak of the American Civil War gave him added arguments, since an unfriendly North placed the disunited colonies in peril. To the Maritime Provinces he pointed out the economic benefits that they would reap by joining hands with the Canadas in building a new nation. Thus by ceaseless advocacy in eloquent addresses and writings he helped perhaps more than any other individual to create the psychological basis for Canadian federation. McGee's influence survived his death at the hands of an assassin. His championship of Canadian nationalism was the acknowledged inspiration of the "Canada first" group, which played an important part in chalking out lines of political and economic development for the dominion.

MCGEE, WILLIAM JOHN (1853-1912), American anthropologist and geologist. McGee was associated with the United States Geological Survey for ten years beginning in 1882; the next ten years he spent in the Bureau of American Ethnology and the remainder of his life in research in geology and conservation. His contributions to geology were conspicuous through his geological maps of the United States, which were standard for many years. He helped to lay the scientific foundations for the conservation movement, and his researches relating to potable waters of the United States were classic contributions to the solution of the pressing problems of urban water supply. The ultimate objective motivating these studies was the good of mankind; he carried this ideal over into anthropology, which he believed should above all concern itself with contemporary life. He visualized in advance of his time the development of a bureau for research devoted to the conservation of national life and advocated the detailed study of primitive peoples as an essential part of this program rather than as an end in itself. In anthropology his most original contributions were his field study of the Seri Indians ("Seri Indians" in United States, Bureau of American Ethnology, *Seventeenth Annual Report*, 1895-96, Washington 1898, pt. i, p. 9-344) and his observations upon desert environments; in the latter he presented concisely the interrelations of plant and animal life as constituting a kind of community and then observed man in this setting. McGee anticipated human ecology, as is seen in his best known papers on environment, the "Beginning of Agriculture" and "Beginning of Zooculture" (in *American Anthropologist*, vol. viii, 1895, p. 350-75, and vol. x, 1897, p. 215-30). He was one of the last of the group associated with J. W. Powell in the Bureau of American Ethnology; the broad and daring generalizations of these anthropologists have since proved largely untenable, but their insistence upon the collection of field data in language, culture and anatomy yielded invaluable mate-

rials which served as the basis of the interpretations of later scholars.

MACH, ERNST (1838-1916), Austrian physicist, psychologist and philosopher of science. Mach was born in Moravia. As a youth he was taught classical languages by his father, who had been a tutor in aristocratic families; during the same period he worked two days a week with a cabinetmaker, a training which was to prove valuable in his later experimental work. After completing his studies at the University of Vienna he remained as a *Privatdozent* in physics. In 1864 he was appointed professor of mathematics and later of physics at the University of Graz. Three years later he was called to the University of Prague as professor of physics, serving also as rector during the year 1879-80. In 1895 a special chair of philosophy of the inductive sciences was created for him at the University of Vienna. On his retirement in 1901, after he had suffered a stroke of paralysis, he was made a member of the Austrian house of peers.

Mach began his scientific career with experimental studies in the physiology of the senses, publishing numerous articles in the publications of the Vienna Akademie der Wissenschaften. Later he turned to the more general problems of the methodology and philosophy of science. At an early age he had read Kant's *Prolegomena*, and later he was greatly impressed by Darwin's work. These two influences led him to look upon science not as a body of laws of the universe but as a biological instrument which humanity has fashioned for itself in order to master nature in the simplest way possible. The "principle of economy" as a methodological rule of scientific investigation, into which Mach's doctrine crystallized, was formulated by him shortly after 1861. It held that in order to accomplish a certain result the scientific investigator chooses "the simplest, the most economical and the most expedient means." On the basis of this principle and of the Kantian doctrine of phenomena, which he simplified into a doctrine of sensations as the sole content of immediate experience, Mach undertook a methodological analysis of the whole field of physics. In order to trace the

historical development of the separate branches of physics he went back to their sources and endeavored to establish the methods by which the various scientists were guided in their work. He was determined (after the fashion of Berkeley and Hume, whom, however, he had not read) to emancipate physics from all metaphysical elements, understanding by the latter term everything that is not immediately perceivable by the senses.

During his lifetime Mach was not understood and was for the most part repudiated by his colleagues, but after his death his doctrines began to exert a great influence in physics. His sensualistic attitude, from which Mach tried in vain to free himself, is accepted today by numerous physicists as a satisfactory epistemological foundation for science. His repudiation of the concept of substance proved to be a highly effective weapon against the doctrines of crude materialism. Mach also attacked atomism, which he regarded as a metaphysical doctrine. His criticism of the Newtonian conceptions of time and space served as a starting point for the relativity theory, although he himself wholly disagreed with this theory when he learned of it before his death. Not only Einstein's work but even the more recent developments in physics, such as Heisenberg's quantum mechanics, have been inspired by the Machian philosophy.

Mach's influence on the social sciences was mainly through psychology, which was affected by his work on the physiology of the senses and by his doctrine of sensationalism as a theory of mind, the latter being closely associated with the similar views of Avenarius. Indirectly his ideas on the methodology of physical sciences had a repercussion on the social sciences as well, reinforcing the belief propagated by instrumentalist philosophers that all scientific laws are merely conveniences rather than completely binding objective determinations. Mach's philosophical outlook also had an important repercussion on the socialist movement in Russia and Austria. In Russia a faction headed by Bogdanov sought to use Mach's doctrine with its rejection of all metaphysics as the new philosophic base for socialism. In Austria Friedrich Adler and his followers still remain Machians in their general philosophy.

MACHAJSKI, WACLAW (1866-1926), Polish-Russian social theorist and revolutionist. As a revolutionary Marxist, Machajski was arrested in 1892 and spent a decade in prisons and as an exile in Siberia, where he worked out a theory of the labor movement which was elaborated in his writings (all of which were published in Russian over the signature A. Volski) and known in the history of the Russian revolutionary movement as *Makhayevshchina*. In 1903 he escaped from Siberia to western Europe. He returned to Russia after the revolution of 1905, left again about the end of 1907 or early in 1908 and finally returned after the downfall of the czarist regime.

The gist of his theory is the idea that nineteenth century socialism in general and Marxian socialism in particular represent the ideology not of the working class, which he thought of in terms of manual workers only, but of "the growing army of intellectual workers, the new middle class which with the progress of civilization absorbs within itself the middle strata of

society." Higher education he considered the privileged property of this rising bourgeois class, a sort of invisible capital expressing itself either actually or potentially in the incomes paid to this class, which are higher than the wages paid manual labor. The most radical, malcontent section of the intellectual workers, according to Machajski, opposes private capitalist rule and seeks its elimination, aiming to substitute its own rule in the form of government ownership or state capitalism (euphemistically called state socialism, socialism or first phase of communism). Under this new system the new ruling class—civil servants, technicians, managers and other intellectual workers constituting the bureaucracy of the state—will enjoy privileged incomes, and to their offspring alone will be transmitted the higher educational opportunities and the resulting higher incomes. The workers will remain at the bottom of the social ladder, self-perpetuating, low waged "slaves of manual labor" just as under private capitalism. Intellectual workers (including the self-taught ex-workers) try to enlist the support of manual workers, winning their confidence by helping them in some of their struggles for better wages and by holding out as a new religion for modern slaves the socialist ideal of human brotherhood for future generations.

Machajski conceived of the emancipation of the working class not through the seizure of power as advocated by the socialist intelligentsia nor through anarchist or syndicalist methods but as a result of a revolutionary economic mass struggle. This struggle was to develop under the leadership of an international organization of conspirators as a succession of general strikes and uprisings for higher wages and for public works for the unemployed. When under the pressure of these economic struggles the private capitalists could no longer satisfy the growing demands of the workers, the state would take over industries, inaugurating state capitalism. The struggle for higher wages would continue against the bureaucracy of the socialized state, until equalization of wages for manual and intellectual work was achieved. This new condition would afford equal opportunities for higher education for all, thus bringing about a classless society.

Machajski called his theory neither socialism nor anarchism; his follower E. Lozinsky has suggested that it be called equalitarianism.

Under the official name of the Workers' Conspiracy groups professing Machajski's opin-

ions were formed in various Russian cities before and during 1905; their adherents, generally known as *Makhaevtzi* (followers of Machajski), conducted revolutionary activities chiefly among unskilled workers and the unemployed, devoting their energies exclusively to the wage struggle, which was to be extended to an economic general strike and to the demand for public works for the unemployed.

Machajski saw in the October revolution of 1917 along with elements of genuine working class revolt the ascent to power of the lowest strata of the middle classes, particularly the semi-intelligentsia and the self-taught ex-workers, who sought not to abolish economic inequality but only to increase the number of its beneficiaries. He considered that the manual workers could not have their own government so long as economic inequality condemned them as a mass to ignorance, and that it was therefore useless for them to endeavor to secure a better government than that of the Soviet state. They could, however, exert mass pressure upon the authorities, forcing them to seize or reduce all higher incomes, to increase wages of manual workers and to provide for the unemployed until all incomes had been equalized.

MACHIAVELLI, NICCOLÒ (1469-1527), Italian historian, statesman and political theorist. Machiavelli, who was born in Florence of a

noble but poor family, began his public career in 1498 as a clerk in the chancery of the Florentine republic. The following year he was appointed secretary to the Dieci di Libertà e Pace (Ten of liberty and peace) and in this capacity was sent on several missions to Italian and foreign courts. In 1502 he was sent to Cesare Borgia, who with the help of the French and papal troops was attempting to unite Romagna and The Marches under his rule. Machiavelli was almost an eye witness to the famous Senigallia ambush, in which Borgia had four chieftains of mercenary troops, who had deserted his side and been won back by false promises, strangled to death. He was greatly impressed by the words and deeds of Borgia and most probably derived from him the model for his *Il principe*. When the Medici with the help of Spanish troops reentered Florence and again became masters of the city, Machiavelli, who had remained faithful to the gonfalonier Soderini, was deprived of his secretarial position; and after some weeks of imprisonment he retired from public life. It was during this period of retirement, in 1513, that he wrote his most famous work, *Il principe*. In 1522 he succeeded in regaining to a certain extent the favor of the Medici. But in 1527, when they were overthrown and again banished, Machiavelli was charged with having received favors from them and was again eliminated from public life.

On Machiavelli and above all on his *Il principe* an entire literature has been written. Never has a writer been so extolled and so abused. He has been hailed by many as the true founder of political science; on the other hand, the term Machiavellism has become a synonym for craft and duplicity and for the prevalence of expediency over truth and loyalty whenever it is a question of aggrandizing a state or preserving its government. Machiavelli cannot, however, be properly understood unless he is regarded in the setting of the political conditions of his time.

At the end of the fifteenth century and at the beginning of the sixteenth Italy, split into a multitude of states, was from a military point of view very weak, since almost all the states had entrusted their defense to mercenary troops, and was continually invaded and devastated by French, Spanish, German and Swiss armies. No state was strong enough by itself to resist effectively France or Spain, and the mercenary troops had sufficiently proved their inferiority to the foreign armies. It was by observing these conditions and reflecting upon them

that Machiavelli was led to conclude that only by the creation of a great Italian state and through the organization of a national militia would it be possible to expel the foreigners beyond the Alps. Although it cannot be denied that in dedicating *Il principe* to the Medici he aimed to gain the sympathies of the new masters of Florence, it is none the less true that he intended at the same time to draw up a program for the guidance of that Italian prince who would determine to free Italy from foreign rule.

The chief weakness of Machiavellism is the striking contradiction between the abject character of its means and the nobility and loftiness of its goal. It is difficult to believe that a person capable of resorting to the vile stratagems of the petty Italian tyrants of the period should at the same time have possessed such greatness of mind as to adopt Machiavelli's patriotic program. And if it is true that the precepts of a most rigid morality cannot be observed in politics, it is no less true that politics is an art in which the sense of limits and proportion is of the greatest importance. It is for this reason that lies and disloyalty to achieve their purpose must be employed with great caution and parsimony. One discovered to be a habitual liar and a breaker of sworn agreements is not trusted. Elementary as these considerations are, they seem to have escaped Machiavelli's attention, a fact all the more strange since they were certainly not neglected by other Italian writers, such as Guicciardini and Scipio di Castro.

Machiavelli's maxims are nearly always based upon a pessimistic conception of human nature and are very often too general to be of much assistance in specific cases. Human beings are in part as he describes them—namely, "ungrateful, deceitful, cowardly, and greedy"; but even Machiavelli admits that this is not true of all human beings. Moreover he forgets to add that even those persons who resemble the portrait drawn by him are sometimes capable of a certain manifestation of altruism and generosity; and he fails to tell how to distinguish the so-called morally superior persons and how it is possible to profit from the small portion of goodness and loyalty that can be found even among morally inferior individuals.

The world wide fame and reputation of Machiavelli's ideas have been due to many factors, some of which are of a temporary and local and others of a permanent character. Among the former may be mentioned the bitter polemical discussions which took place in the second half of

the sixteenth century between Catholics and Protestants, in which each party accused the other of acting according to Machiavelli's principles; in a sense both parties were justified in their charges, since the Florentine writer professed on the one hand to be a Catholic and on the other hand displayed very little respect for the pope and the church. The Italians of the nineteenth century discovered in Machiavelli the precursor of the Risorgimento; similarly, his writings were popular among the leaders of the German national movement in the same century. Among the factors of more permanent character are undoubtedly the calm and cold objectivity with which Machiavelli describes the multitude of defects displayed by the human mind and the courage with which he points out the faults and vices of both the great and the humble, of the common people as well as of the classes that participate actively in political life. It is true that Machiavelli's conception of things and human beings is often inadequate, for he sees essentially only one side and nearly always the worse side of the extremely complicated nature of human beings. This side, however, he depicts with an incisiveness which impresses the reader in a singular manner and calls forth either great admiration or great repugnance and sometimes both.

Although Machiavelli claimed that his aim was to teach his fellow beings the art of deceiving and to prove to them the advantages and the necessity of lying, as a writer he was extremely sincere. He possessed to an exceptional extent that professional literary honesty which compels the author to convey to his readers his real opinions, without worrying over the success or failure of his work. He was honest in his private life and as an official; if he tried to dictate to others the rules of the art of deceiving in public life, he was himself by no means a political climber. Had he been a rogue and a self-seeker his public career would have been, in view of his talents, much more brilliant than it actually was; he would not have died in poverty, and he would have abstained from writing *Il principe*, for all true rogues know quite well that the first rule of their art consists in not revealing its secrets to others.

Other important works by Machiavelli were *relazioni* on his mission in France and Germany; *Discorsi sopra la prima deca di Tito Livio* (1521), in which he gave advice to republics and scrutinized the causes of ancient Roman grandeur; *Libro dell' arte della guerra* (1521), in which he confirmed the concepts already ex-

pressed in *Il principe* on the necessity for republics to have their own national militias; *La vita di Castruccio Castracani* (1532) and *Le storie fiorentine* (1532), interesting for the part in which he narrates the events occurring in the fifteenth century; and, finally, the *commedie*, often marked by obscenity, an unfortunate characteristic of the period, but not, however, without *vis comica*.

GAETANO MOSCA

Works: Opere, ed. by P. Fanfani, L. Passerini, and G. Milanese, 6 vols. (Florence 1873-77), tr. by Ellis Farnsworth, 4 vols. (2nd ed. MACHINE, POLITICAL. "Such words as 'boss' and 'machine' now imply evil," Theodore Roosevelt observed in his *Autobiography*, "but both the implication the words carry and the definition of the words themselves are somewhat vague. A leader is necessary; but his opponents always call him a boss. An organization is necessary; but the men in opposition always call it a machine." Roosevelt might have added that the boss generally claims the title of leader and that the machine, usurping the name as well as the thing, calls itself the party organization. Such facts are significant. They indicate that in popu-

lar usage the words have a derogatory implication, that the boss is looked upon as a perverted leader and the machine as a perverted organization. The test is one of motive and method. According to Ostrogorsky the men of the machine look out for themselves rather than for the party; according to Jeffe Macy their purposes are purely selfish and inconsistent with the public welfare. They are unscrupulous both in their use of political power and in the methods that are employed in gaining and holding it. They practise politics for profit.

The distinction suggested here in the contrast between public interest and private interest has been emphasized by the periodic revelation of abuses in municipal government, abuses which take the form of an alliance between politics and predatory business concerns and between politics and the criminal elements. But the term machine, like the term boss, is frequently employed without these sinister connotations. When newspapers spoke of the "Townley machine" in North Dakota or of the "La Follette machine" in Wisconsin they did not mean that either Townley or La Follette was personally corrupt or tolerated corruption in others. They were impressed by the fact that a particular group of politicians had established more or less permanent control over the Republican organization, enforcing such hierarchical discipline and moving with such relentless precision as to evoke the idea of a machine.

Obviously this term, like most political terms, can be defined on the basis of usage in a considerable variety of ways. Here it will be taken to mean a group composed mainly of professional politicians who gain and hold power by secret and often corrupt methods—although with a show of popular sanction—who dictate party nominations and appointments to public office and who set personal advantage above that of the party or the community.

Professional politics emerged in the era of Jacksonian Democracy, when the necessity of regimenting and mobilizing the newly enfranchised masses placed a great emphasis upon party organization. Politicians of a new type, proficient in the arts of management and scientific in their modes of action, rudely thrust aside the landed proprietors who had governed in the time of Hamilton and Jefferson. As early as 1823 Niles described them with infinite distaste as "persons who have little, if any, regard for the welfare of the republic, unless as immediately connected with, or dependent on, their own

private pursuits . . . " (*Niles' Weekly Register*, vol. xxxiii, 1823, p. 370). They disguised the essentially oligarchic character of their regime by flattering the voters while shrewdly manipulating them; and with the increase in the number of elective offices, which they made it their business to control, and with the application of the spoils system to the civil service they drew their sustenance from the public treasury.

There gradually took place a specialization of political functions. The people were engrossed in their private affairs, absorbed in the supreme task of conquering the continent and laying hold of its resources. They had, as Walter Weyl says, "neither leisure nor inclination for the drudgery of running the government. Consequently, the making of nominations, the control of elections, the divisions of spoils, and other profitable labor came to be the work of a despised ruler, the professional politician." Public service, like the continent, was appropriated for private gain. It should be observed of course that political activity and political power always and everywhere tend to become a monopoly of the few. Professor Michels in his study of *Political Parties* formulates an "iron law of oligarchy," having discovered that in Europe even among the socialists party decisions are made by a mere handful of the members, sometimes ludicrously small. What happened in the United States may be said therefore to illustrate a general law. But certain peculiarities of American politics must be explained in terms of the local environment.

In the first place, why should the oligarchy have tended to become so disreputable? Walter Weyl gives an answer. Politics was business, he says, but low grade business. "Not offering the boundless possibilities of other enterprises, it attracted a poorer quality of men. In De Tocqueville's day an American was not ordinarily intrusted with public business until he had signally failed in his private business." Perhaps one may hazard a further opinion. Great issues, which would rouse enthusiasm and command the loyalty of high minded men, have seldom marked the party conflict; in normal times the two major parties have faced each other without any fundamental divergence of policy. This situation may be attributed to the size of the country, the diversity of economic and other interests and the perpetual need of compromise as a basis for large scale cooperation. And so elections degenerate into a crude struggle for office, say the critics, and become attractive to the cupidity of the mere spoilsman. In the second

place, the apathy of "good citizens" and their willingness to abdicate in favor of the professional politician was due to something besides absorption in their own affairs. Politics became too complicated for the amateur. The absurd multiplication of elective offices, with short terms and rotation as a supposed safeguard against official arrogance, and the elaborate system of party primaries and conventions for making nominations gave the most conscientious voter a sense of frustration. He could not penetrate the technicalities; needing help he entrusted his baffling problems to the professional politician.

The rise of the machine must be connected also with a feature of American government which discourages the growth of effective and responsible leadership. The framers of the constitution, as Woodrow Wilson observed, set up the check and balance system "to keep government at a sort of mechanical equipoise by means of a standing amicable contest among its several organic parts." They distrusted power as dangerous to liberty; and therefore they spread it thin and erected barriers against its concentration. In our state governments, where the principal executive officers were elected and thus made independent of one another, this fatal weakness was still more pronounced; and these officers had been deprived by minute and specific statutory directions of all latitude in the discharge of their official duties. A similar dispersion of power marked local areas. As a consequence, when the people or particular groups among them demanded positive action, no one had adequate authority to act. The machine provided an antidote. There was built up, in the words of Herbert Croly, "a much more human system of partisan government, whose chief object soon became the circumvention of government by Law . . . The lawlessness of the extra-official democracy was merely the counterpoise of the legalism of the official democracy. The lawyer having been permitted to subordinate democracy to the Law, the Boss had to be called in to extricate the victim, which he did after a fashion and for a consideration" (*Progressive Democracy*, New York 1914, p. 254).

The boss is the kind of leader that the machine develops. He typifies its efficiency as an instrument of power, which in contrast to the arrangements in American states and municipalities objectifies the principle of concentration. His operations are facilitated, it is true, by certain more or less accidental conditions of American democ-

racy: the existence of the spoils system, the over-elaboration of electoral processes, the indifference of "good citizens," the pliability of the ignorant masses; and his opportunities for aggrandizement have been vastly enlarged during the past half century by his traffic with big business—he has become the broker, the indispensable intermediary in the purchase and sale of political privileges. But these various factors hardly make clear his essential function. The boss is the man who, like the prime minister abroad, brings together the scattered fragments of power. Leadership is necessary; and since it does not develop readily within the constitutional framework, the boss provides it in a crude and irresponsible form from the outside. His tenure is not affected by any doctrine of short terms and rotation; Penrose ruled Pennsylvania for fifteen years, Murphy ruled New York City for twenty years and Cox ruled Cincinnati for thirty years. The scope of his authority is not limited by minute prescriptions of law or by any scruples about the separation of powers: if he is a county boss he gives orders to the board of supervisors, to the district attorney and in fact to all public officers, including even judges.

Within the pyramidal structure of the machine there are big bosses and little bosses connected in a sort of feudal relationship. Their position depends ultimately upon their control of the party primaries, which they regard as more important than the subsequent elections. The boss of the assembly district or city ward holds his place only as long as he can dominate a majority of the precincts; and he maintains therefore intimate and mutually advantageous contacts with his subordinates, the precinct captains, whose success or failure in delivering the vote on primary day involves his own fortunes. It is often as precinct captain that the future boss gets his training and demonstrates his possession of the necessary qualifications. What he needs above all is the ability to handle men. "There's only one way to hold a district," according to George Washington Plunkitt of Tammany Hall; "you must study human nature and act accordin'" (Riordon, W. L., *Plunkitt of Tammany Hall*, New York 1905, p. 68). As captain he must be a friend to every man, assuming if he does not feel sympathy with the unfortunate and utilizing in his good works the resources which the boss puts at his disposal. He must be loyal; according to Plunkitt he is never justified in going back on his boss, "as long as the leader hustles around and gets all the jobs possible for his constituents"

(p. 68). The great test is efficiency. The boss rules by right of conquest and through the possession of those native qualities which are sufficient in themselves without any formal grant of authority.

The machine may extend its dominion over the whole state either through the ascendancy of a single boss or through the operations of a "ring" of local bosses who act in concert. Thus for three quarters of a century Pennsylvania was dominated first by the Camerons, father and son, then by Quay and finally by Penrose—an unbroken succession. As a rule, however, the county or the city is the unit. It is not incongruous for the ward boss to do homage to the city boss and to take orders from him. That feudal relationship serves the interests of both. The overlord fills a necessary role in coordinating the different parts of the machine and in opening up larger sources of patronage and perhaps of graft. For the same reasons a state boss may be able to impose himself upon the local bosses and machines, since it is his function to coordinate their activities in the larger field of state politics, to dictate and distribute nominations and appointments as well as executive and legislative favors. The logic of the situation suggests indeed that the machine should erect a structure paralleling the government in every political area. But with the size of the area the engineering difficulties increase. The state boss exists only by way of exception; what is usually found is a group or "ring" of local bosses whose uncertain and fluctuating control of the state government depends upon secret accommodations. There has never been a national boss. Nevertheless, the need of a unifying agency cannot be denied; and thus the phenomenon, met with more and more frequently, of a president or governor like Theodore Roosevelt with a big stick and a contempt for legalistic restraints.

The machine lives off the country like a conquering army. In its earlier period the spoils of office furnished the chief means of subsistence. There were, first of all, the numerous elective offices, which might be sold under the disguise of campaign contributions or given to faithful adherents as a reward for service and as a source of livelihood. Then, its ticket having triumphed, the machine applied to the civil service the principle of Senator Marcy that "to the victor belong the spoils." By giving his henchmen and heelers jobs that he could at any time take away the boss not only kept them in a state of dependence but replenished the treasury by levying a percentage

assessment upon their salaries. Patronage still remains a most important factor in the economy of the machine. But the offices are prized much less for the salaries attached to them than for their strategic value as a base of operations. In the decades following the Civil War new factors came into play. The rapid growth of cities afforded opportunities for pillage on a colossal scale, particularly in the awarding of public contracts and in the granting of franchises for public utilities. Tweed's accomplishments in New York and McManes' in Philadelphia differed in proportions but not in character from what was being done almost everywhere in the country. Eastern cities suffered most, because the hordes of immigrants settled there and reacted favorably to the shrewd benevolence of ward politicians. This was also a time of remarkable economic expansion. The great railway corporations and industrial monopolies pushed forward ruthlessly toward their objectives and by lavish corruption bought every sort of privilege and immunity. The machine now established its lucrative relationship with big business.

The tribute that the machine exacts from the community assumes such varied forms as to defy enumeration. It may fall within the category of what Plunkitt called "honest graft." Thus with private information that the city intends to widen a street or acquire a park or build a subway the politician buys parcels of land which will be condemned at a price fixed by friendly commissioners or which will soar in value when the improvements get under way. The tribute may, on the other hand, be derived from the protection and exploitation of vice and crime. This activity centers in the police department. While usually concerned with gambling, prostitution and the illegal sale of liquor it sometimes involves an alliance with racketeers and gunmen. But what the police do in permitting violations of the law is characteristic of all branches of administration which can exercise a similar discretion. The district attorney and even the magistrate, being creatures of the machine, may acquiesce in monstrous perversions of justice. The tax assessor may levy blackmail by threatening a rigorous search for hidden personal property. The building inspector may fasten upon the most insignificant violations of the code or for a consideration close his eyes to the most glaring and pernicious. When very large sums are involved, as in the erection of a great hotel or apartment house, the bribery of the building de-

partment may be ingeniously disguised; somehow a certain law firm—notoriously high in its charges for the service—can always secure a relaxation of vexatious requirements. Not the least flagrant abuses are connected with the letting of public contracts. An insider can safely underbid his competitors if he knows that the elaborate safeguards of the law will be ignored, that specifications regarding the materials to be used will not be enforced, that time clauses will be waived and that fraudulent claims will be paid without investigation. This explains the role of the machine politician as sleeping partner in some contracting firm. City councils and state legislatures have profited by blackmailing as well as by serving corporations; blackmail is paid in return for the withdrawal of a measure that has been introduced solely for the purpose of extortion.

The depredations of the machine growing bolder with increased opportunities gradually aroused popular resentment and indignation; and since the parties did little or nothing to purify themselves, an attempt was made to exorcise the devils of corruption by statute. First came civil service reform, which by applying the merit system to appointive offices robbed the victor of his spoils. Unfortunately the reform commended itself to few of the states; and therefore the results were disappointing. Next came the introduction of the Australian ballot. It was expected to stop the intimidation or bribery of voters and to encourage independent candidatures by reducing the cost of elections. But since the form of the ballot diverging from its Australian prototype facilitated the voting of a straight ticket, the machine suffered little damage from the change. The first reform had aimed at starving the victorious machine; the second at reducing its advantage in the election, its means of victory. The third reform went behind the election and regulated the nominating processes. The direct primary took the place of the delegate convention. At the same time in the hope of displacing the oligarchy of professional politicians and restoring power to the rank and file the parties were deprived of their voluntary character and subjected to drastic statutory regulation. Other weapons were placed in the hands of the people: the initiative and referendum, which gave them a direct control over legislation; and the recall, which allowed them to sit in judgment on their elected officers in the interval between the all too frequent regular elections.

These later reforms have a common character-

istic which invites criticism. Instead of simplifying the labyrinth they have added to its complexities. The harassed voter is not only confronted with a preliminary campaign of election within the party but also asked on the day of the general election to express an opinion on all sorts of legislative measures. He has become therefore still more inadequate, still more dependent on the specialist of the machine for guidance. The officials of the party are now entangled, like the officials of the government, in a web of legalistic restrictions, from which presumably they must wait for the boss to extricate them. The escape from machine politics lies not in this direction but in simplifying structure and processes and in concentrating power and responsibility. If the grip of the machine has been loosened somewhat, the improvement must be attributed to factors which have raised the tone of business as well as politics and to technical improvements in administration. Public opinion

stimulated by innumerable civic organizations has become more alert, while systems of cost accounting and settled forms of procedure act as a bar to some of the grosser forms of fraud.

MACHINERY, INDUSTRIAL. The machinery industries as a whole comprise the manufacture of all contrivances, implements and apparatus, including accessories, which operate mechanically when driven by animal, human or motor power. The perpetual problem of these industries is the creation of mechanical equipment whose production and subsequent operating and maintenance costs shall be as low as possible, imposing a twofold application of the economic principle of maximum efficiency. Accordingly the machinery industries affect every other industry not only as purveyors of production equipment but above all in the organization and construction of plants. Industry (including agriculture, transport and communication) is dependent upon the machinery industries and the increasing efficiency of their products and of modern machine technology. Thus these industries alongside the production of raw materials occupy a position of pivotal and universal importance in the economic life of the present age. Upon the machinery industries moreover depends national economic power. Their direct economic importance is also great; in the United States in 1929 the output of the machinery industries (including electrical machinery but exclusive of locomotives and other transport equipment) amounted to \$6,964,000,000, one tenth of the total industrial output, and employed 1,093,485 wage earners, one eighth of all wage earners engaged in manufacturing.

Despite their essential unity the machinery industries are characterized by a great diversity of output. This is true not only of the different divisions but also of single establishments, which frequently manufacture a variety of products. The machinery industries may be grouped into five major divisions—agricultural machinery (*q. v.*), electrical manufacturing industry (*q. v.*), industrial machinery, locomotives and office and household appliances. There is some overlapping; thus household appliances constitute a considerable part of the output of electrical manufacturing. While these divisions are pertinent, there is no recognized international classification of machinery; in particular the term

industrial machinery is in use only in the United States. Industrial machinery includes all machines and accessory equipment used directly in industry (in the production of either consumers' or producers' goods) with the exception of electrical machinery, which has long since become an independent industry but is itself an important market for industrial machinery. It embraces prime movers, including all types of engines; metal working machinery and machine tools, including milling and bending machines, lathes, drills and presses; textile machinery; woodworking machinery, including cutters and planers; auxiliary machinery, including pumps, compressors, blowers and refrigerating apparatus; hoisting equipment, including cranes, derricks and elevators; dredging, excavating, road making and building construction machinery; baking, shoe, laundry and paper and printing machinery; mining and oil well machinery and machinery for smelter, steel and rolling mills as well as apparatus for use in the chemical industries.

In the United States in 1929 the value of output in the machinery industries amounted to \$6,964,000,000 divided as follows: industrial, \$3,917,000,000; electrical, \$2,273,000,000; agricultural, \$278,000,000; household and office, \$494,000,000. Since the World War the output of household and office machines has increased much more rapidly than that of agricultural machinery. These two divisions play a more important part, in both production and export, in the American machinery industries than in those of other major producing countries. Industrial machinery constitutes the largest group, particularly in other countries, where the output of agricultural, electrical and business machines is absolutely and relatively much smaller than in the United States.

As the term industrial machinery is used only in American literature, and as the various types of machinery are so classified in the statistics of different countries as to render difficult an adequate distinction between industrial and other machinery, international comparison of production, employment and foreign trade can be only approximate, including other than industrial

machinery. Comparative figures on this basis yield a different picture of the distribution of world machinery production and exports from that which would be presented by corresponding figures limited to industrial machinery. The German statistical classification, however, which excludes electrical machinery and boilers but includes locomotives, agricultural machinery and household and office appliances, may be taken, for international comparative purposes, as roughly equivalent to industrial machinery.

Domination of modern economic life by the machine, one manifestation of which is the tremendous variety of machines and of industries producing them, is of comparatively recent date. The modern machinery industries arose after the perfection of the steam engine in 1781 by James Watt, who succeeded in combining the steam piston with a crank mechanism, transforming reciprocating into rotary motion. The steam engine became a prime mover that could be employed anywhere, rendering the operation of machinery independent of manual effort and of natural forces bound by time and place. It was both preceded and followed by other British inventions which were indispensable in the development of machinery. The use of coke in blast furnaces improved the smelting process and yielded a better and cheaper cast iron, the indispensable material in the production of the newer types of machinery. Improvements in machine tools together with steam engine drive made possible more efficient metal working, an indispensable prerequisite in the construction of modern machinery. Metal working was further improved by the introduction of steam hammers, hydraulic presses and mechanical rolling mills. Iron and steam became the basis of the development of machinery and of the industrial revolution. The first important application of the new machine technology was in the English textile industry. In 1779 Crompton invented the spinning mule and made possible automatic mechanical spinning. Mechanical weaving, developed by Horrocks, followed in 1803; improvements were added by Roberts in 1822 and many other textile machines soon followed. The introduction of machinery into other branches of manufacturing was slower but equally steady.

The revolution in machinery was accompanied by a revolution in the methods of constructing machines. Older types of machines, composed mainly of wood, were constructed by handicraft labor. The new machines, composed of iron and other metals, necessitated the development and

construction of a whole series of other machines for their production. This necessity made increasingly large technical and economic demands upon the industry, particularly as machines grew in size and complexity. The progress of the machinery industries is bound up with the engineering and economic problems involved in the construction of machinery for the production of machines.

At the beginning of the nineteenth century Great Britain was the undisputed leader in the production of machinery. It endeavored to retain this position by all possible means, including prohibition of the export of machinery (particularly textile machinery), tools, models and plans and of the emigration of engineers and skilled workmen; a series of such prohibitory laws initiated in 1774 were not finally repealed until 1845. The prohibitions were ineffectual in preventing the dissemination of British inventions. The United States, less affected by the flood of British goods because of its remoteness from Europe and hence forced to rely upon the development of its own industry, soon adopted Great Britain's technological advances and improved upon them. The huge domestic market in the continually growing territory of the United States took the place of Great Britain's export markets and promoted the construction of many types of machinery, particularly after the adoption of the 1828 tariff. Despite its own early contributions, for example, the invention of the steamboat, the United States depended upon technical borrowing from Europe in the development of its machinery industries. In the numerous small shops of New England there grew up a considerable manufacture of industrial machinery, especially textile and woodworking machines. By 1840 locomotives were being extensively constructed. While American manufacturers borrowed on a large scale they made considerable improvements in the models they adopted, particularly in interchangeable and automatic mechanism for metal working machines, which gradually surpassed the European.

Germany, France and Belgium also followed Great Britain along the path of industrialization. In Germany, which later became the chief competitor of the British and American machinery industries, the Napoleonic wars and the temporary exclusion of British competition during the continental blockade aided technical development, but after the lifting of the blockade British industry proved its superiority by the flood of goods which it poured into Germany. Germany's

technological progress was also retarded by the political dismemberment of the country, which blocked communication and free access to markets. The abolition of the Prussian internal duties in 1818 and the formation of the German Zollverein in 1834 enormously facilitated the growth of commerce and industry. Germany, however, had early adopted the British models of the new machine technology in various fields of production (the first German steam engine was built in 1785) and developed new types of machines, such as the first mechanical printing press (invented in 1810).

The new machine technology was given a tremendous impetus by developments in transportation. Stephenson built the first practicable steam locomotive in Great Britain in 1829, and shortly afterward the first railroad was opened. The United States followed immediately, independently of Great Britain; Germany did not begin its first railroad until 1835. The construction of locomotives and railroads made the greatest demands upon the machinery industries and was of the utmost importance in their technical and economic growth. The extremely rapid and intensive development of transportation accelerated the process of industrialization begun with the invention of the steam engine and introduced a new epoch of economic growth in all branches of industry and trade, with the machinery industries supplying the necessary technical equipment. Great Britain and the United States still led in machine construction. In 1845 only 15 percent of the locomotives used in Germany were built at home; most of them were imported from Great Britain, while the remainder came from Belgium and the United States. Even in 1857 only 57 percent of Germany's locomotives were of domestic origin, 30 percent coming from Great Britain and 13 percent from the United States and Belgium.

The objective conditions for the development of the modern capitalist system were created by the great inventions in machine technology, particularly efficient prime movers, by the improvement in the production and utilization of iron, by the progressive mechanization of production processes and, finally, by the liberation of hitherto unknown transportation facilities on land and sea. These developments were bound up with the lowering of production costs by the use of the continually improved production methods, the consequent decline in commodity prices and the increase in sales, the growth in real income, the opening of new markets, the growing competi-

tion in all the fields of production and the rapid rise of population, which combined to insure an almost uninterrupted progress of industrialization. This trend was not confined to industrial activity. In the United States the extremely low density of population led at a very early date to the employment of machinery in agriculture. In Great Britain the country's large capital resources and the existence of great landed estates encouraged the use of agricultural machinery, while the availability of a large and cheap labor supply temporarily kept the machine out of agriculture in Germany, France and other continental countries. Because of its exceptional geographical conditions the United States took the lead in the manufacture and use of agricultural machinery; it still dominates in this field.

It is impossible to describe here the technological evolution of the many kinds of industrial machinery in use today (see MACHINES AND TOOLS). It was the result of increased competition among the chief producing countries and of their need for special machinery adapted to the requirements of each country as well as of the general trend toward industrialization. Thus the first sewing machines were invented in the United States together with special woodworking machinery, machinery for the manufacture of shoes and leather and the first typewriters. American machine tools were developed to a high stage of perfection, surpassing those of Great Britain and Germany, with the introduction of series manufacture (and later of mass production) in the manufacture of machinery. Modern methods of manufacture, division of labor, specialization and standardization led to the construction of special precision machine tools in the United States. By 1867 American machines were noted for their originality, although British types were still standard and Great Britain maintained its lead in the manufacture of heavy engineering machinery and of machine tools for shipbuilding. The design and construction of machinery were revolutionized by new processes of steel manufacture originated in Great Britain and Germany. New types of prime movers arose in the years 1865 to 1900 to compete with the steam engine, leading to new technological advances—the electric dynamo, which paved the way for the modern electric motor, the gas engine, the gasoline engine and the Diesel oil engine. Electric drive for all types of machinery characterized the new developments in machine construction, resulting in a rapid electrification of industry.

These and other advances in machine technology arose out of the needs of industry, agriculture and transportation; the former in turn reacted upon the latter, aiding their development. Within the space of a hundred years there was an unparalleled economic growth in the three leading industrial countries, interrupted only by recurring periods of cyclical depression. The territory of the United States spread from the Atlantic to the Pacific forming a vast internal market. The Civil War had an extraordinary influence on the machinery industries because of its huge war requirements and the political stimulus which it gave to the development of industrial capitalism. Within a few years one industry after another was mechanized and new industries were called into being. The complete mechanization of the manufacture of boots and shoes was symptomatic of the general trend. Iron and steel production increased enormously in response to the increasing demand for machines and other metal products, while improved metallurgical methods made necessary more and newer types of machines. The development of electricity called for new types of machines and a whole new industry to produce them. One important aspect of American machine production

was the emphasis upon standardized and interchangeable parts. By 1913 the United States led the world in the quantity and quality of its machines, its output of industrial machinery alone amounting approximately to 50 percent of the world output (Table I).

American machinery exports, negligible before the Civil War, began by 1875 to loom as a competitor in the European market. Penetration of the far eastern market began with the completion of the first transcontinental railroad in 1869. American exports consisted mainly of machines and tools manufactured on a mass production basis and specially adapted to the needs of other countries, such as agricultural machinery, machine tools, firearms, sewing machines, locomotives, stationary engines and sugar mills (the latter went particularly to Cuba, where sugar production was coming under the domination of American interests). The United States, however, was a comparatively unimportant exporter. Great Britain, on the contrary, expanded its export trade enormously on the basis of its technological leadership in machine construction and consolidated its historical position as an importer of raw materials and an exporter of manufactured goods. Germany's eco-

nomic growth was comparatively slow until after the achievement of national unity in 1871, but its subsequent rapidity compensated for the late beginnings. In 1868 for the first time the German foreign trade in machinery showed a favorable balance and thereafter, with the exception of the period from 1873 to 1875, the balance continued to be favorable.

The American, British and German machinery industries differed considerably in their technological and economic development. In the United States and Great Britain factories early began to specialize in the production of particular types of machines, for which there was an assured demand either in the large American domestic market or in the export trade of Great Britain and its colonies overseas; consequently competition in these countries between similar machinery products was not very keen. In Germany, however, a large number of manufacturers of machinery not only felt the pressure of foreign competition but had to share a comparatively limited domestic market; hence most of them were compelled to adopt an inclusive program of manufacture covering a wide variety of machine products. The consequent keen competition led to underbidding and the necessity of accepting high priced special orders. But it also acted as a powerful stimulus to technical progress

and the improvement of machinery. In the United States and Great Britain concentration on specialized products made possible mass production yielding lower costs and higher profits. Only during the second half of the nineteenth century (as a serious competitor only after 1900) did the German machinery industries enter the world market to obtain new outlets. Germany concentrated on theoretical research and the scientific design of machinery, while British machine construction and for a long time the American as well were guided largely by empirical knowledge. Engineering education and the training of skilled workers were first extensively developed in Germany and constituted an important factor in the growth of its machinery industries. One of the reasons for the final superiority of Germany and the United States over Great Britain in machinery construction at the beginning of the present century was the backwardness of Great Britain in technical science and factory organization and management.

Increasing industrialization in economically backward countries as well as the demand for special types of machinery in the more industrialized countries led to a great increase in the foreign trade in machinery. In 1890 Great Britain was the major exporter, followed by the United States and Germany (Table II); the last

Source: The figures for 1913 and 1925 are from International Economic Conference, *Mechanical Engineering*, League of Nations, Publications, 1927. II, 6, 2 vols. (Geneva 1927) vol. I, p. 46. The figures for 1929 are compiled by author from official sources; the "1913 prices" are obtained by using as a divisor 137, the 1929 value for the index compiled by the British Board of Trade.

named imported half as much machinery as it exported and Great Britain about one sixteenth, while the American imports were negligible, a noteworthy result of technical and price superiority. For the five years from 1901 to 1905 exports by the United States of machinery of all types averaged \$77,950,000 yearly. But while the United States was cutting down Great Britain's lead, Germany cut down the lead of both, overtaking first the United States and then Great Britain and becoming the leader in the world machinery market. In 1913 Germany led the world with 29 percent of total world exports of industrial machinery, while Great Britain followed with 28 percent and the United States with 27 percent. The three chief producing countries increased their total share of such machinery exports from 79 percent in 1890 to 84 percent in 1913. But their competitors also considerably increased their exports and new competitors arose in Sweden, Switzerland, Canada and Holland. Great Britain, the pioneer of the machinery industries, reached in 1907 the peak of its machinery exports, which thereafter remained relatively stationary, while the exports of the United States and Germany rose uninterruptedly except in 1909, a year of general cyclical crisis. In the years immediately preceding the World War Germany not only took the lead in exports but imported fewer machines than Great Britain.

While the three major producing countries exported an approximately equal volume of machinery, the relation of these exports to total national production varied considerably; in 1913 Great Britain exported 45 percent of its machinery production, Germany 26 percent and the United States only 10 percent. Of the total world output of machinery the United States produced 50 percent, Germany 20 percent and Great Britain only 12 percent (Table 1), a complete shift since the earlier years of the nineteenth century. Productive efficiency also varied considerably. In 1913 there were employed in the world's machinery industries 1,900,000 workers, 33 percent of whom were in the United States, 24 percent in Germany and 17 percent in Great Britain; annual output per worker amounted to \$2750 in the United States, \$1525 in Germany and \$1210 in Great Britain. The American lead in both output and efficiency was an expression of the intensive mechanization of industry and the increasing adoption of mass production and specialization.

Other countries were of minor importance in

the production of machinery. There was an appreciable output only in Russia, Austria-Hungary, Canada, France, Italy, Switzerland, Belgium and Sweden. The chief manufactures of the minor producing countries were the usual types of prime movers and machine tools and the simplest kinds of industrial machinery. A high degree of efficiency prevailed only in a few special branches, such as agricultural machinery in Canada and France, special textile machinery in Switzerland, locomotives and mining machinery in Belgium and dairy machinery and ball bearings in Sweden. The output of all the minor producing countries combined amounted to only 18 percent of the world's production of machinery in 1913, but they employed 26 percent of the wage earners engaged in the world's machinery industries. An extremely large proportion, about 50 percent, of the wage earners employed in the machinery industries are highly skilled. In 1913 approximately 2,300,000 persons were engaged in the machinery industries; of these 82 percent were wage earners and 18 percent clerical, technical, supervisory and executive employees.

Industrial machinery constituted the overwhelming bulk of the output of the machinery industries in the earlier stages of their development. After 1875, however, electrical machinery constituted an increasingly large proportion of the output of machines, particularly in the United States and Germany, until it became almost as important as industrial machinery. The output of household and office machines also increased steadily, the largest growth being in the United States.

As a result of the World War the relative importance of the different machinery producing countries changed considerably. The enormous demand for war materials in all the belligerent countries led to the erection of numerous new machinery plants. Moreover the war resulted in a pronounced decrease of machinery exports; Germany was practically excluded from the world market, while American and British exports also declined sharply. In consequence the newer industrial countries, such as Japan, Canada, Australia, British India and others, began to provide for their needs by developing their own machinery industries as well as industries producing consumers' goods, thus attempting to become independent of the necessity of importing manufactured goods. These developments must ultimately bring about a reduction in the machinery sales of the older industrial countries, both in

export markets and to their own manufacturing industries.

Recent international comparative data covering machinery construction are available only for 1925. But since then the relative ranking of the several nations has changed but little; only the ratio of production to capacity fluctuated considerably. From 1913 to 1925 the world production of machinery, excluding electrical and some other types of machines, rose about 10 percent—from \$3,225,000,000 to \$3,500,000,000 in pre-war prices (or \$5,250,000,000 in current prices). This, however, assumes a 1925 price level of 150; a decline would be shown by the use of a higher price level as suggested by some authorities. Output rose considerably after 1925; if electrical and all other types of machines are included, the world's output of machinery in 1929 exceeded \$10,000,000,000. The world's production capacity, however, rose 45 percent during the same period, assuming that in 1913 production equaled capacity. This 45 percent rise in capacity, accompanied by an increase of only 10 percent in production, necessarily resulted in sharply intensified international competition. The United States and Great Britain both increased their production 25 percent, while Germany's production in 1925 attained only 70 percent of its 1913 value. The share of the United States in world production rose from 50 to 58 percent and of Great Britain from 12 to 14 percent, while Germany's dropped from 21 to 13 percent. An analogous development characterized the production capacity of these countries. The American capacity rose 67 percent and the British 44 percent, while the increase for Germany and the other producing countries was only 20 percent. In percentages the world's production capacity in 1925 as contrasted with that in 1913 was distributed as follows: United States, 57 and 50; Great Britain, 12 and 12; Germany 17 and 20.4; all the other producing countries, 14 and 17.6. In 1925 only 75 percent of capacity was utilized in the United States, 87 percent in Great Britain, 58 percent in Germany and 80 percent in all the other producing countries combined. In 1925 the United States continued to export 10 percent of its total production, while Great Britain's exports dropped to 30 percent as compared with 45 percent in 1913 and Germany's remained constant at 25 percent. The changed situation after the war and the trend toward the increased production of machinery industries by countries other than the three major producers are reflected in the

rise of 50 percent in machinery production in Canada, 39 percent in France, 25 percent in Switzerland, 200 percent in Japan and 35 percent in Australia.

Of the three major producing countries the United States made the greatest progress in capacity and production combined. The output of all types of machinery rose from \$1,582,000,000 in 1914 to \$4,727,000,000 in 1923 and to \$6,964,000,000 in 1929. The output of industrial machinery rose from \$978,064,000 in 1914 to \$3,917,782,000 in 1929, of electric machinery from \$335,170,000 to \$2,273,000,000, of agricultural machinery from \$164,087,000 to \$278,539,000 and of all other types from \$105,087,000 to \$494,956,000, electrical machinery scoring the largest relative increase. The growth in the American industrial machinery industry is shown in Table III.

TABLE III

GROWTH OF AMERICAN INDUSTRIAL MACHINERY INDUSTRY, 1914-29

| CENSUS YEAR | NUMBER OF ESTABLISHMENTS | NUMBER OF WAGE EARNERS | VALUE OF OUTPUT | TOTAL WAGES |
|-------------|--------------------------|------------------------|-----------------|-------------|
| | | | IN \$1000 | |

| 1929 | 10,476 | 648,229 | 3,917,782 | 992,678 |

* These figures for 1925 do not correspond with the figures in Table I, because of differences in classifications.

Source: Compiled from United States, Bureau of the Census, *Biennial Census of Manufactures 1921-27* (1924-30), and *Census of Manufactures, 1929: Summary by Industries* (1930).

The following statistics for 1929 yield an indication of the output and relative importance of the major categories of American industrial machinery: engines, \$460,003,000; machine tools, \$184,208,000; pumps and pumping equipment, \$153,347,000; textile machinery, \$115,525,000; oil well machinery, \$89,067,000; refrigerating and ice making machinery, \$65,757,000; dredging and excavating machinery, \$60,745,000; cranes, including hoists and derricks, \$57,840,000; metal working machinery (other than machine tools), \$53,300,000; conveying machinery, \$48,537,000; elevators and elevator machinery, \$44,044,000; mining machinery, \$40,325,000; woodworking machinery, \$35,151,000; air compressors, \$33,317,000; road making machinery, \$30,694,000; paper and pulp ma-

chinery, \$30,456,000; laundry machinery, \$28,893,000; meters, \$25,135,000; blowers and fans, \$23,455,000; baking machinery, \$21,730,000; cement and concrete machinery, \$19,924,000.

In 1929 more than half the world's output of industrial machinery was produced in the United States, and the proportion becomes greater if all types of machinery are included; thus the United States in 1929 produced \$2,273,000,000 of electrical machinery, Germany in 1928-29 produced nearly \$1,000,000,000 and Great Britain in 1928 produced \$400,000,000. In 1929 the American industrial machinery industry employed 648,229 wage earners, a decline of 18,750 over 1919 although production had greatly increased during the decade, indicating a substantial gain in output per worker. For the machinery industries as a whole the number of wage earners rose from 618,737 in 1914 and 998,484 in 1919 to 1,093,485 in 1929. Average yearly earnings of wage earners in the industrial machinery industry rose from \$1430 in 1923 to \$1530 in 1929, an increase based on the higher productivity of labor; the average is considerably higher than for manufacturing as a whole, indicating the larger employment of skilled workers. While the productivity of American labor has increased considerably since 1913, productivity in Great Britain and Germany has been practically stationary and may have declined. The productivity of the American worker in the machinery industries is perhaps three times as high as that of the European worker. This is another indication of the high degree of mechanization in the United States, partly a result of higher wages; in Europe this development is retarded by cheaper labor. Wages in the American machinery industries have not, however, increased as much as has output per worker.

One of the characteristics of the machinery industries is the comparatively high elaboration involved in their manufacturing processes. In the United States this expresses itself in the high proportion of "value added by manufacturing" to total value of output, ranging as high as 60 percent, which is considerably higher than the average for manufacturing as a whole. Except in electrical manufacturing, where an unusually high degree of concentration prevails, another characteristic is the relative lack of concentration, due to the great variety of products manufactured by the industrial machinery industry. Yet even here concentration is increasing; thus the number of establishments declined from 12,483 in 1919 to 10,476 in 1929—fewer than in

1914. Competition is relatively keen among producers of industrial machinery, only 10 percent of whom are organized in trade associations. Profits since the war have been high, with the exception of course of the depression years 1921, 1922, 1929 and those following; for the period as a whole average profits amounted to 10 percent.

The World War played an important part in the rapid growth of the American machinery industries, which were also enabled to invade foreign markets formerly dominated by Great Britain or Germany. American progress continued after the war aided by the growth of new industries, such as radio and aviation; by the unusual expansion of old industries, such as automobiles and electric power; and by the impetus to more intensive mechanization of all production processes in order to save labor and reduce production costs. The American machinery industries grew to their present size under the stimulus of an unparalleled mechanization of production processes. In the United States approximately \$25 worth of machinery per capita is annually installed, compared with \$10 worth in Great Britain and \$9 worth in Germany.

Although Great Britain's machinery production was 25 percent higher in 1925 than in 1913 and capacity 44 percent higher, the British machinery industries were stagnant because of relative economic decline, overcapitalization, the multiplicity of small firms unable to operate efficiently or profitably and the intensification of American and renewal of German competition in foreign markets. In addition the British machinery industries are not organized into trade associations and are thus unable to defend their interests collectively and energetically. The most important cause of stagnation, however, is the fact that Great Britain has fallen behind in the march of technological progress; its machinery industries lack adequate modern facilities in both technical equipment and production methods. This was clearly revealed not only by the revival of foreign competition and the decline of British exports but also by Great Britain's extraordinarily increased demand for foreign machinery, which (on the basis of pre-war prices) was twice as high in 1925 as in 1913. Whereas Great Britain buys large amounts of machinery in the United States and Germany, these countries purchase comparatively trifling amounts from Great Britain. Without the aid of its markets in the dominions and colonies the British decline in machinery exports would have been greater. Finally, the decline in exports of

manufactured goods, which are of crucial importance to the economy of Great Britain, involved an additional blow to its machinery industries. The Committee on Industry and Trade (Balfour Committee), which reported that the net profit (on paid up capital) of twenty-seven machinery companies sank uninterruptedly from 11.8 percent during the period from 1911 to 1913 to 4 percent in 1925, declared that only the increasing adoption of mass production and improved technique could insure future progress.

During the World War Germany increased its production facilities by 20 percent, but in 1925 its production was only 70 percent of the pre-war level. By 1929 its production had risen to over \$1,000,000,000, about equal to the pre-war output. The period of moderate inflation down to the close of 1922 favored machinery sales both at home and abroad, but when German firms again adopted gold prices after the stabilization crisis a sudden slump occurred; machinery had become too expensive for both the domestic and foreign markets. A slight recovery in 1924-25 was followed by a renewed slump in 1926 as a result of the economic crisis. In 1928-29 the output of Germany's machinery industries was twice as high as in 1926. Employment reached 80 percent of normal during 1928. In the ensuing period of decline machinery exports were forced to compensate for the reduced domestic market. Averaging 26 percent of total production for the years from 1921 to 1927, exports rose to 34 percent in 1929, 42 percent in 1930 and probably over 50 percent in 1931. Machinery sales and profits moreover were greatly reduced by excessive domestic competition and insufficient specialization of production in definite types of machinery. In 1913 German machinery corporations made an average profit of 10 percent on their capital. In 1925-26 this average profit rate was only 1.76 percent as compared with 2.26 percent for all industrial enterprises. By 1926-27 the rate of profit had dropped to 0.21 percent; it rose in 1928-29 to 5.25 percent and declined to 3.73 percent in 1929-30, while other German industrial profits were higher. This relatively low rate of profit has always characterized the German machinery industries. In 1930 these industries included about 3200 establishments employing 420,000 workers. Establishments employing about 80 percent of the total labor force were organized in a central association, the Verein Deutscher Maschinenbau-Anstalten, and in seventy-seven affiliated trade associations.

Practically all countries had a higher installa-

tion of new machinery in 1925 than in 1913. Germany had a lower installation, which is explained by extremely low domestic sales in 1925 because of the stabilization crisis and the shortage of capital following the inflation period. The comparatively large portion of the German population still engaged in agriculture, using much less machinery than is customary in the United States, is also a factor which must be considered in comparisons with Great Britain, where agriculture is relatively insignificant, and with the United States, where farms are highly industrialized. Moreover wages, which are about three times higher in the United States and about 30 percent higher in Great Britain than in Germany, also affect the differences in the consumption of machinery; the higher the wages, the greater is the extent of machinery utilization, as shown by Canada and the United States. Australia's utilization of machinery also greatly increased as a result of the rapid industrial growth of the country and its low density of population. Argentina and Cuba exhibited the same tendency. At the other extreme China and British India had the lowest utilization of machinery. Japan, on the other hand, increased its consumption of machinery 60 percent from 1913 to 1925 (allowing for the rise in prices).

The production and sale of machinery are directly dependent upon cyclical fluctuations. As the machinery industries supply the technical equipment for all branches of economic activity, their own development and sales react immediately to the slightest change in the economic situation. There is no separate growth for the machinery industries nor do special laws govern their development. On the contrary, as the producers of means of production they are hit early and severely by every depression, while a boom usually affects them less intensely and later than other industries. They also have maximum fluctuations in employment. Hence consideration of the variations in the production and sale of machinery is an important factor in the study of the business cycle.

In recent years important changes have occurred in the export of industrial machinery (Table II). Germany lost its lead in the world market as a result of the war. In 1925 American exports amounted to 35 percent of world exports, compared with 27 percent in 1913; Great Britain's share had declined from 28 percent to 24 percent, while the share of Germany (which had temporarily lost all its markets) had declined from 29 percent to 20 percent. American exports

rose again until 1929 and then declined sharply because of the world depression. Germany's exports reached their lowest point in 1923, but then rose uninterruptedly until they surpassed Great Britain's exports, which moreover remained consistently below the 1913 level. The total volume of the post-war world trade in machinery reached the pre-war level only in 1926, but it then increased until exports in 1929 were 63 percent higher than in 1913 (in pre-war prices). The three major producing countries shared equally in the 1928-29 increase in machinery exports; but the United States, aided by its large capital resources and technological superiority, retained its supremacy in the world market. In 1929 the three major producers combined accounted for 80 percent of machinery exports compared with 84 percent in 1913; the share of the United States was 35 percent, of Germany 25 percent and of Great Britain 20 percent. Nearly all the other exporting countries also shared in the rise of exports; France, Switzerland, Sweden, Japan and Canada made particularly large gains.

The American exports of machinery have increased steadily since 1923 (Table IV). Exports

TABLE IV
VALUE OF AMERICAN EXPORTS OF MACHINERY, 1923-29
(IN \$1000)

| YEAR | ALL TYPES OF MACHINERY | INDUSTRIAL MACHINERY |
|-------|---------------------------|-------------------------|
| 1923 | 282,296 | 141,651 |
| 1924 | 310,576 | 145,088 |
| 1925* | 367,206 | 172,312 |

of industrial machinery increased considerably less than the exports of other types of machinery. The greatest relative increase was in exports of agricultural machinery, which rose from \$50,-373,000 in 1923 to \$140,801,000 in 1929. The main items of industrial machinery exports included steam and internal combustion engines, \$16,649,000; construction and conveying machines, \$25,492,000; mining, quarrying, oil well and refining machinery, \$39,601,000; metal working machinery, \$42,006,000; and textile machinery, \$8,611,000. The geographical distribution of industrial machinery exports was as follows: Europe, \$81,390,000; Latin America, \$71,672,000; Canada, \$68,713,000; Asia, \$31,-

742,000; Oceania, \$7,893,000; and Africa, \$6,409,000. Machinery exports, chiefly to the markets of the Americas and Asia, occupy an important place in the foreign trade of the United States.

A significant aspect of the foreign trade in machinery is that countries producing machinery, not the less industrialized countries, are still the largest importers as well as exporters of machinery (Table v). In 1913 the older industrialized countries which themselves produce machinery absorbed 65 percent of world machinery exports; although this proportion declined to 55 percent in the post-war period the decrease was largely due to a temporary reduction in the purchasing power of several of the producing countries. While Great Britain's imports rose considerably in comparison with 1913 and the American imports (which were very small in 1913) also increased, Germany's imports remained practically constant. Among the other producing countries Canada and Japan experienced an extraordinary rise in imports. The imports of Italy and Norway remained constant, while Russian imports in 1928 and 1929 were below the level of 1913, although 1930 showed an increase of 65 percent. The trend toward industrialization of economically backward countries is clearly revealed in China's increased machinery imports and in the imports of Australia, New Zealand, South Africa and even Egypt and Argentina. This also appears from the fact that approximately 75 percent of the British exports of machinery are absorbed by the less industrialized countries. Germany dominates the machinery imports of nearly every European country, usually supplying 50 percent and more of the market. Great Britain does not dominate all its dominions and colonies; the United States leads in Australia and Canada as well as in all the importing countries of the Americas.

The industrialization of countries hitherto economically backward constitutes an urgent problem of world economy in general and of the older industrial countries and their machinery industries in particular. This tendency is strikingly revealed in the mighty efforts of Soviet Russia to industrialize its economy and build up independent machinery industries, even though it will continue to import machinery for some time to come. The trade in machinery within the group of countries producing large quantities of machinery will always be in the interest of general progress, technological development and useful competition. But the machinery exports

TABLE V

IMPORTS OF MACHINERY, 1913-30

to countries which are mainly producers of raw materials and only slightly industrialized, such as British India, Australia, China, South America and even Japan, apparently involve two threats to the exporting countries. The imported machinery is used to produce goods which compete with similar goods formerly imported from the machinery exporting countries. At the same time there occurs a growth of machinery industries in the newly industrialized countries, competing

with the machinery exports of the older industrial countries. It takes considerable time, however, for an economically backward country to reach the stage of production in any particular field already reached by the older industrial countries, and more time must elapse before the necessary markets are conquered. In view of the modern tempo of technological progress the older industrial countries will continue to enjoy, at least for some time to come, an undefeat-

able economic and technical advantage. More-over economically undeveloped regions, such as China, are so large that industrialization instead of exhausting the demand for goods creates new and larger demands. This is especially true of machinery industries in the newer industrial countries, as the establishment of such industries is dependent upon coal and iron, skilled personnel, technical research, adequate home markets and a generally higher economic and technical development in other branches of industry. Technological and economic progress will continue to originate in the older producing countries, which will thus tend to maintain the supremacy of their machinery industries.

MACHINES AND TOOLS

ANCIENT, MEDIAEVAL AND EARLY MODERN.

The differences between the tool and the machine have never been clearly defined. A tool is an object with which man works directly upon material and transforms it. A simple machine is a tool with which man can save time and energy in his work without employing external energy; in this class are the lever, wedge, wheel and axle, pulley, screw and inclined plane. An assembled machine is theoretically, according to Reuleaux, a "combination of resistant bodies so arranged that by their means the mechanical forces of nature can be compelled to do work accompanied by certain determinate motions." The use of human motive power in its operation is characteristic of a tool, but that alone does not necessarily distinguish it from a machine, some types of which may also be operated by human motive power. A tool is distinguished from a machine by its comparative simplicity and its capacity of being handled directly by the worker, who is consequently limited to the use of only one or two tools at any particular time. A machine may be a combination of tools operating simultaneously within the frame of a mechanical contrivance; the tools are not handled directly by the worker but by the contrivance itself, which comprises the tool or working machine, the transmitting apparatus and the motor mechanism. But tools are a component part only of machines which work upon material and transform it; many of the older machines, such as the crane, and of the newer, such as locomotives and dynamos, are not mere combinations of tools, while many modern tools are more complicated than the earlier machines.

By utilizing natural objects man used tools before he made them. He gradually learned to fashion tools out of stones and flints whose chance shape favored his purposes. In almost all the known cultures of the stone age are found hammers, chisels, planers, awls, knives, scrapers, borers, axes and the like. These tools were at first extremely crude, usually worked only on one side; but they were gradually improved, polished and perforated for handles made of wood, bone and horn. The men of the stone age constructed the first combination tool, a stone with a sharp point for boring and two edges for cutting and scraping. They also constructed crude machines for boring and sawing stone; these contrivances invented more than five thousand years ago facilitated more precise work and saved time and energy. A gimlet rotated with

the aid of a hunting bow must grind to powder the entire content of the hole, which moreover does not become wholly cylindrical. The boring contrivances of the stone age utilized a hollow stick of elder or similar wood, with the addition of sand, to grind into the stone being bored; a cylinder of stone was left within the stick, and in this way the work of grinding to powder the mass of inner stone was avoided. Many half finished borings of this sort have been found in the stone working places as well as many bored out centers, all of which demonstrate this method of working. It would be a mistake to assume, however, that in the stone age there were employed only those tools and implements which have been discovered by the archaeologists. In all probability many more were in use, at least the lever, the angle and the plumb.

During the bronze, or casting, age great improvements occurred in the making of tools. Tools of copper, a metal which could easily be hammered into shape, in many cases preceded those of bronze. In the stone age the working parts of tools were set in wood—stone knives, for example, were set in wooden sickles; in the bronze age the tools were as much as possible cast out of one piece of bronze and only the handles consisted of wood. In certain castings which have been found the tool and the handle are of one piece. This period developed two important new tools, the file and the blowpipe for blowing a small flame, especially for use in soldering. The utilization of many different kinds of tools is revealed by the varied metal work of the bronze age, particularly its earlier stages, in which hammered sheet metal was produced without the use of heat. To beat out metal slightly convex hammers are needed as well as punches, molds and stampers; all the latter tools were of course beaten out with the hammer. Tongs were without joints and were similar to present day nippers. Some form of tools for riveting probably already existed. Many loose rivets have been found in excavations; not only sheet metal but also leather girdles were riveted together. The compass and ruler were also in use during the bronze age. The handles of tools in this era are remarkable for the accuracy of their fit in the hand, which it was desired to spare as much as possible. Nor were quite modern labor saving methods unknown; the great wagon wheels of about 500 B.C., unearthed in 1883 at Dejbjerg in Jutland and now in the Copenhagen Museum, are not made of separate short pieces put together to form a circle but are

turned in a circle out of single blocks of wood.

Another contribution of the bronze age was the most important of all machines, the turning lathe. In its simplest form this consisted of two blocks between which the material being worked turned on two pegs of bronze. Around the material was twisted the string of a hunting bow, which was moved to and fro with one hand; with the other hand a bronze chisel was held against the revolving material. This form of the lathe has been preserved throughout the ages, and today it is found in as simple a form as the turning wheel of the watchmaker. By a slight alteration in the primitive lathe it is possible to drill, engrave, grind, polish, mill or stamp metal.

The error has been repeatedly made in investigations of the tools and machines of the bronze age of explaining too many things simply on the basis of present day skills. It is known, however, that there were in early times many methods, tools and machines which are no longer in use and of which consequently no knowledge at present exists. It is therefore necessary to reconstruct from the technique itself the tools and machines that were used. Lack of technical knowledge has been responsible for the neglect by research students of the technical and historical importance of the tools and machines used in this age, which reveal nearly all the basic principles underlying subsequent more highly developed forms.

In the casting, or bronze, age man learned to hammer bars of bronze into sheets without the use of heat. The forging age, usually called the iron age, is characterized by the production of ingots of pig iron in fire and their molding in fire by hammering. With the gradual improvement of the forge higher temperatures were developed and a fluid product obtained. The production of steel from iron was the most significant discovery of this age and was of the utmost importance in the development of tools and machines.

It may be assumed that as early as the stone age wooden rollers were placed underneath heavy burdens (tree trunks or stones) to facilitate cartage. From this the wagon wheel may have been derived. But it is unlikely that other wheels employed in the making of machines, for example, the water wheel or the windmill wheel, originated in the wagon wheel. In the Greek islands there still exist windmill wheels of the earliest type: the ends of several radiating fixed spokes are bound together with a rope to form a polygon, and between the spokes are fastened

triangular ship's sails. The water wheel probably developed out of the water lever with which grain was pounded. By placing a large spoon at one end of the lever and allowing water to run into it the ladle was made to lift up the pounder placed at the other end of the lever. When the spoon had sunk far enough it poured out the water and let the pounder fall. The water wheel resulted when many such spoons were placed around a revolving axis. It is striking that the oriental, Arabian and mediaeval water wheels clearly reveal the form of the ladle, or scoop. The form of the flat paddle in water wheels apparently first definitely appeared in Rome at the beginning of the Christian era. China developed the so-called turbine form of the water and windmill wheels, in which the shaft is vertical. Although folklore furnishes indirect testimony that ancient China had many machines, Chinese machine making must not be overrated; it is well established that only those Chinese books which were written under the influence of the Jesuits of the missions after 1726 contain impressive sketches of machines, many of which are pictures of European machines taken over by the Chinese.

The extensive Babylonian irrigation systems with their elaborate pumping apparatus indicate a relatively high development of machines and tools in old Asia Minor. This was also true of ancient Egypt. Many peculiar tools are pictured on the walls of old Egyptian tombs. The Egyptians did not use the spade but with a flat hoe beat the ground loose and threw the earth directly to one side. The carpenters used sawing tools which pressed apart slits made in the wood. This was necessary since the saw with crosscut teeth was unknown. Egypt probably developed the cogwheel and improved the potter's wheel, the disk of which in its primitive form was set going by the hand, so that the wheel was now rotated with the foot. The Egyptian ropemaker used a whirling flywheel by which the rope rotated continuously, but the ropemaker's spinning wheel was unknown. The Egyptian flywheel is found also in the Orient, where it is used to keep in continuous rotation the little prayer drums in the hands of the faithful. Two measuring machines, the balance scales and the water clock, were developed by the Egyptians. The tomb of Petosiris (300 B.C.) contains an excellent picture of an Egyptian turning lathe, and earlier reliefs depict oil and wine presses. The screw pump, with which Archimedes is reported to have become acquainted in Egypt,

was probably introduced into that country by the Persian conquerors. The proper interpretation of a passage in Herodotus indicates that the Egyptian pyramid builders erected on the steps machines which raised the blocks of stone with the help of a great lever. This hoisting apparatus was adapted for other uses in the Egyptian and Asiatic hydraulic machines, which are still used in Egypt. The heavy stones of the pyramid of Khafre (c. 2850 B.C.) reveal notches into which the claws of the hoisting machine locked. Obelisks placed on sturdy boards were transported on rollers and were raised by being rolled upon an inclined plane, the end sliding into a huge pile of sand, which was then dug away; thus the obelisk already in an almost vertical position could be laid in its foundation.

The technology of the Greeks was based upon the earlier contributions of Asiatic and Mediterranean peoples. A critical examination has shown that practically all the technical inventions attributed to the Greeks were known long before. For example, the great battering ram for the demolition of fortress walls was not invented by the Greeks but was taken over from the Babylonians; on the alabaster reliefs of Nimrod (c. 680 B.C.), which are now in London, heavy transportable rams are delineated. The Pennsylvania University Museum has an important Babylonian seal impress bearing one of the oldest known representations of the plow; one of the men is in the act of seeding the tube, or grain, drill, through which the seed was dropped into the furrow. In these densely populated regions as well as in China such apparently modern agricultural machines were necessary. Syrian technicians were probably the inventors of the improved machines with which the Greeks and Romans shot cannon balls and arrows; reconstructions of these machines show an initial force of 24,000 kilograms, while according to Josephus a cannon ball of fifty-three pounds was shot a distance of 360 meters. Greek machines were skilfully constructed; one indication of this is the assertion of Plato that the world's axis rests on steel points, a comparison which must have been based upon experience with this mode of support. Plato stressed also the importance of experiment; he says repeatedly and emphatically that knowledge based on "counting, measuring and weighing" is a means of correcting the deception of the senses, a means of making apparent wonders clear and intelligible. Misunderstanding of Aristotle, who in his book on mechanics treats the subject dialecti-

cally but not exhaustively, was responsible for lags in many branches of technology; thus there was set up the doctrine that "nature abhors a vacuum," which became fatal to pneumatics, hydraulics and pump and engine construction.

An extensive array of tools and machines was described by Philo of Byzantium, a writer who lived in the second or third century B.C. Until recently it has been possible in only a few cases to prove that the machines described by Philo were in practical use at the time. It is certain that there was employed a form of treadmill run by human power for the purpose of drawing water from a well by means of a chain of buckets. Such a chain (chain pump) was also operated by ladle wheels built into a brook or river. Another type of wheel, the Persian wheel, had dippers alongside the ladles to raise the water level of brooks, the water being directed through ditches over the fields for irrigation. Philo also describes the steam bellows for blowing a fire, a contrivance for moving flap valves, and pumps with cylinders and pistons. According to him the cylinders were cast out of bronze and turned on a lathe.

Greek technicians, known as *technitai* or *mechanopoioi*, were the teachers of the Roman machine makers, who were classed among the building technicians or architects. Many machine parts have been recently unearthed, among others a well preserved middle section of a great Roman cannon in Spain, a water wheel in Pompeii and great screw presses in Herculaneum. Pompeian vases, reliefs and mural paintings as well as the many tools unearthed reveal an extensive Roman development and use of tools and machines, the economic and social significance of which during this era has not yet been adequately appreciated. This is largely because Roman as well as Greek writers give meager accounts of technology; only the more recent excavations and comparisons with other periods have revealed the high technical achievements of the Romans not only in building but in the development and construction of machines and tools. High technical excellence was required in the perfect execution of Roman bathtubs made of bronze plate, the drawn iron wire mentioned by the poet Claudianus (c. 400), which was probably a Roman invention, the work in colored glass and the making of intricate door locks. The blowpipe was used to manipulate glass paste. In one of the two imperial ships recently dug up in Lake Nemi there were found the remains of a ball bearing on which there apparently revolved

a pavilion for the purpose of excluding the sun. The emperor Commodus had carriages whose wheels measured the distance covered by means of a clocking mechanism. Roman arenas contained elevators for the combatants and animals and heating systems were constructed under the floors of apartments. These mechanical contrivances and the great Roman buildings necessarily required many highly developed tools and machines.

The Pompeian water wheel as well as the many mills and machines for kneading dough revealed by the excavations indicate that water power and the power of animal driven capstans were commonly employed. These sources of power were not, however, utilized in the most rational manner. Horses, for example, were harnessed to the capstan in such a fashion that much of their power was wasted. In the mills there were signaling contrivances to indicate when a horse was going too slowly or was standing still. The horses wore eye flaps to keep them from becoming dizzy and it is possible that there existed a mechanically driven whip, which would seem to be depicted in reliefs and on sixth century war chariots. Roman grain mills in the period of the empire consisted of a cone shaped lower stone and an upper stone hollowed out in cone fashion and suspended on an iron plumb. Flat stones were used only in small mills turned by hand. Grinding mills for crushing oil seeds were described by Cato about the time of 184 B.C. The influence of the machine on occupations appeared in the separation of the miller and the baker. Originally the baker was his own miller, and the mills in Pompeii are consequently in the same room as the ovens. But when toward the end of the fifth century A.D. the water wheel displaced the horse capstan in the mill, the millers left the city to settle near water.

Pompeii was noted for the construction of large machines. The recently discovered water wheel, which was buried under lava in 79 A.D., is only 93 centimeters in diameter and only 17 centimeters thick; and Vitruvius (c. 14 B.C.) describes only small water wheels which turned very fast. But it must not be concluded that the Romans did not build large machines, especially water wheels. The Greek treading drum, in which persons worked in an erect posture, must have had a diameter of approximately 4 meters; Greek and Roman machine makers were therefore capable of building water wheels of corresponding diameter. Roman reliefs depict cranes, apparently 12 meters in height, in connection

with great treadmills run by at least five workers.

As has been shown by Henry C. Mercer in his books and in his museum, modern craftsmen are still dependent upon Roman tool forms, which were well adapted to their respective purposes. Many seemingly unsuitable Roman forms which cannot yet be explained may have involved certain methods of working unfamiliar to modern craftsmen. Roman shears were without joints and consisted of two knives connected by an elastic handle or flat spring, a form retained by women and tailors well into the Middle Ages. The Roman forms of sheep shears and turf shears are still in use. The failure of the Romans to use jointed scissors is puzzling, since pictures reveal that they were familiar with the linked tongs as early as the fifth century B.C. The Roman saw was constructed of a wooden frame held together on one side by a coiled rope which tightly held the blade of the saw, the blade being stationary.

Despite their meagerness Roman technical writings convey considerable information. Vitruvius describes the technical aspects of building, water works and wells, clocks and hoisting mechanisms, water mills and pumps, lathes, bellows and capstans, machine bearings and road rollers. The imposing Roman aqueducts described by Frontinus (*c.* 97), many miles of which were set on stone arches, distributed water through underground pipes soldered together out of single lead sheets. The consumption of water was measured by means of a small standard gauge at the home of the user. Since writings of Hero of Alexandria (*c.* 110) treat more of the science of physics and its apparatus than of machine construction, his automatic door opener and other such contrivances must be considered only as physicists' toys and not as instruments of daily use. This was also true of his anticipation of the steam engine (a wheel moved by steam); people marveled at the contrivance, but it was not utilized as a practical source of power. Both Hero and Vitruvius describe cranes having one, two, three and four masts respectively, which combine the lever, the pulley and the windlass. The handwritten illustrated textbooks on technology, apparently introduced by Apollodorus of Damascus (*c.* 126) and characterized by a passion for the remarkable and unrealizable, have been incorrectly considered technical textbooks. Since the long periods of apprenticeship resulted in entire familiarity with tool and material, it was not necessary that the textbooks should provide any instruction in these matters; in the illustrated

manuals were incorporated, however, the more advanced technical ideas and the knowledge acquired from military campaigns and travels.

There were scarcely any changes (except retrogressive) in tools and machines during the early Middle Ages. Contrary to tradition, for example, bells were not invented by a Christian bishop but arose in definite technical dependence upon oriental bell founding. In Babylon, Greece and Rome only small bells were used at worship, on house doors, on collars of animals and in the market places. Larger bells were necessary to summon the Christian community. But there was no need of a new invention, since the ancients had mechanisms with which they cast huge parts of monuments, temple doors, pillars and the like, as may be seen from those pieces taken from pagan temples and palaces and still found in the churches in Rome. The idea of an inventive ecclesiastical technique was strengthened by the technical textbook of Theophilus (*c.* 1100); but his writings on tools, machines, enameling, glass blowing, glass mosaic work, bell founding, soldering, the preparation of brass, the beating of gold, inlaid enamel work, organ building, the making of paper, forging in a pit and damasking are merely the summary of knowledge inherited from the ancients.

Confusion in terminology creates many difficulties in the study of technology. Wire was originally drawn by a smith from a piece of beaten metal, or "forged"; later metal workers learned to draw wire in a drawing iron, and while the process was different the artisan was still known as a smith. Even fourteenth century writings speak of wire smiths, although no master workman manufactured wire except with a drawing iron. The artisan who worked without a power machine faced a difficult task, as the strongest tools he possessed were the muscles of his body. Toward the end of the fourteenth century an unknown master workman, probably a wire drawer of Nuremberg, conceived the idea of seating himself on a seesaw so that with a strong pull of his muscles and proper use of the whole weight of his body he could jerk himself backward; as he did so he grasped the glowing wire and drew it through the drawing iron. Sketches of these ingenious seesaws of the "jerker" appear in the house records of a Nuremberg handicraft establishment. Work on the seesaw was difficult and tedious. Then a jerker conceived the idea of connecting the seesaw to the winch of a water wheel by means of a strap, which is pictured in the first

printed textbook on civil engineering, published by Biringuccio in 1540 in Venice. The man still rocked himself back and forth, however—an excellent example of how slowly technological progress moves. Disregard of this slow progress is responsible for an entirely false conception of the development of technology; many writers envisage a non-technical antiquity and a Gothic era singularly rich in inventors favored by God and cling to the long refuted notion of an "age of inventions" around the year 1300. This is not correct. Of the three greatest inventions, gunpowder, the compass and the printing press, the first two were Chinese inventions, the compass being introduced into Europe as early as 1000 and gunpowder in the thirteenth century, while the printing press was not invented until two centuries later.

Nor must too much importance be ascribed to the few inventions whose developments are well known. The origins of the majority of technically important inventions are still a mystery. Especially significant is the fact that practically nothing is known of the inventors of tools and machines. There is no inkling of who was the first to introduce a treadle into the loom or the heavy ironworking hammer lifted by the water wheel. The treadle loom appears first in a wall painting around 1310, and there is a German account of 1320 of a great piece of iron construction with the aid of water power. This, however, is wholly fortuitous; it is possible that these mechanical contrivances are hundreds of years older. Inventions of tremendous significance appear suddenly, but their origins are unknown. There is, for example, the mechanical escapement wheel of watches, the origin of which cannot be determined even within several centuries. When a technician devised some mechanical device he did not always try it out at once but often only sketched it. The need for such a contrivance might arise suddenly during times of war and disappear immediately after, with the result that the idea was forgotten: much has thus probably been lost; the old chronicles, for example, tell of wonderful machines once used during a military campaign and of how the Saracens quickly invented machines of their own to counteract the machines of the crusaders.

The introduction of new tools and machines moreover often met serious resistance. In Cologne in 1397 tailors were forbidden to use a machine for pressing the heads of pins. New machines were frequently ordered destroyed by the guild authorities and inventors sometimes

even punished by imprisonment. Only when a new tool or machine benefited a larger circle was it finally accepted. Thus in 1298 the cloth weavers of Speyer were permitted to use the spinning wheel.

Machines of a quite modern character appeared in the later Middle Ages. In 1272 Borghesano, who invented a process of silk reeling, brought from Lucca to Bologna a machine which automatically twisted silk thread as it came from the cocoon into strong spun silk; the machine is reported to have contained from 100 to 120 iron spindles which were all turned simultaneously by a water wheel. It was decreed that whoever showed this magnificent machine to a stranger should be hanged, and it was apparently not until 1555 that it became known in Switzerland and not until 1718 in England. The technology of the English cotton industry which later developed was a technical derivative of the machines in the Italian silk industry of the thirteenth century.

The many thousands of technical sketches by Leonardo da Vinci, which deal with the improvement of tools, lathes and screw cutters, military and power machines, spinning and cloth shearing machines and the like, were not wholly representations of his own inventions but developments of already existing devices which Leonardo wished to improve and to introduce on a large scale. About 1500 he made a sketch of a yarn distributor for bobbins in a spinning machine, a contrivance which was not invented in England until 1794. Leonardo also constructed a steam cylinder with pistons in order to study the action of steam and even tried to shoot a cannon ball from a steam cannon.

The technical literature of the times must not be considered as a collection of fantasies. In the first printed book on machines, published in 1472 by the Italian Valturio, and in the later books of Biringuccio and Agricola the descriptions of machines are based on experience and portray machines and mechanical procedures actually in use. While this cannot be said of subsequent technical literature, even in the latter the descriptions cannot be dismissed as merely fantastic. Historical research makes it increasingly apparent that the machines described were either actually constructed or could have been made without difficulty. Very few of these machines, however, remained in practical use. Later there arose another literature, which aimed to familiarize laymen with the working of new tools and machines and which indicates the

relatively extensive use of mechanical devices in the late Middle Ages.

The illustrated manuscripts and books of the time, which increased greatly in number with the growth of mechanical methods of production, throw considerable light on the tools and machines that were in use. One book describes little rolling machines with which to roll lead strips for window glass trimming. Domenico Fontana in 1590 minutely describes and sketches the tools and mechanical apparatus which he used to transport three enormous obelisks from Egypt to Rome and to set them up in the latter city. Another book describes a ribbon weaving machine, said to have been invented by a citizen of Danzig in 1590, on which several narrow ribbons could be woven simultaneously; previously a ribbon had to be woven by itself on a frame. There are descriptions of tools, usually considered wholly modern, with many parts which could be substituted quickly for each other, resembling the combination of a three-cornered awl and a borer. Many other complex constructions are pictured and explained. Investigations have been confined to the development of a few tools only, but this is wholly insufficient, since the principles of construction involved in any particular tool or machine could have been transferred to another tool or machine in a fashion which cannot be demonstrated today.

In a German manuscript dated 1505, now in the Preussische Staatsbibliothek (MS. Germ. Quart. 132), which contains excellent illustrations of the borer, brace, rounded knives for cutting circular plates, compasses, calipers, tools for tightening crossbows, branding irons, pliers and tools with hollow handles for the insertion of other tools, there appear for the first time two important clamping devices, the vise and the joiner's bench with two clamps movable by means of screws. The screw was established among tools as a saver of time and energy by several unknown inventors toward the close of the fifteenth century. A study of the vise used by metal workers is especially interesting. The Orient and the ancient world had no clamping devices among their tools. The material being worked was held fast by the hands or propped against one or more wedges or pins. Woodworkers did the same on the planing bench. In the house records of the Nuremberg handicraft establishment there are many examples of clamping devices used by metal workers and joiners, but none is equipped with screws. Joiners were apparently also unfamiliar with the screw clamp;

they were so skilled that each could work upon loose material. With the introduction of the screw this skill gradually disappeared. In the manuscript of 1505 the vise, although still constructed entirely of wood, is set with iron clamps. A kind of hand vise entirely of iron appeared in 1438 in one of the illustrated manuscripts on military technique. In 1528 locksmiths are pictured working on a small iron vise. The screw spindle, which lies parallel to the nearer edge of the workbench, has on the right side a four-edged nut which can be tightened or loosened by means of a free key. Progress, however, was slow; it was not until the close of the eighteenth century that circular saws were developed in France and England.

Great improvements were made in the lathe. In 1413 in Brunswick an enormous cannon was bored weighing 8.7 tons, the work on which required a heavy wooden lathe; in the eighteenth century such simple lathes were used for turning very heavy stone pillars. These improvements in the lathe came very slowly; for centuries the material being worked was turned by means of a bowstring, and half the revolutions were wasted as the material revolved. In Nuremberg by 1411 there existed lathes on which material turned in only one direction, and later lathes were operated by a crank and flywheel. One such lathe was designed by Leonardo da Vinci and similar lathes were used by stone engravers. An earlier improvement was the lathe with a support moved by turning a screw. In 1590 a lathe was made equipped with a guiding spindle, but the invention was suppressed and did not reappear until the eighteenth century. By 1700 the belt driven lathe was coming into extensive use. The lathe and its tools were now being exquisitely finished technically; it is possible that not only round but also oval and odd shapes were turned. Although the revolving disk was in use by this time, it was kept secret and was not generally used until the nineteenth century.

The lathe led to the development of the cutter, a tool of the utmost importance in modern industry. Originally the cutter was a tool equipped with a handle and sharp teeth, which was used to cut through strong iron barriers during siege warfare. In building the large instruments for the astronomical observatory in Peking in 1668 the Jesuits in order to level out the great astronomical circle used steel cutters driven by power from a donkey driven capstan. In south Germany toward the close of the seventeenth century the needle makers apparently used small,

round cutters, which were made rough all around in the manner of files, on the tips of which the needles were placed. By 1713 these cutters were so developed that their teeth were used to cut the wheels of a clock.

In mining and smelting there was a considerable technical development, particularly in the construction of pumping, transport and ventilating equipment. By the beginning of the eighteenth century there existed a considerable variety of tools and toolmaking machines made of iron. Machines were becoming larger and their construction imposed heavy demands on tools and machine tools.

F. M. FELDHAUS

MODERN. The technology of machines and tools already in existence served as the starting point for the development of new machinery which culminated in the industrial revolution. An increasing construction of larger and more complex machines during the sixteenth and seventeenth centuries not only improved mechanical engineering but led also to the technological application of scientific discoveries. At the same time the commercial revolution and the early factory system provided an economic basis for the introduction of machinery. Under the early factory system tools were improved and simplified and many new forms of tools were created to meet the requirements of increasing specialization and division of labor; this simplification and multiplication in turn suggested their mechanical combination into machines. Moreover the increasing fund of technical knowledge was enriched by the skill and experience of the machinists who, while engaged in construction or repair, improved upon or invented machines. Particularly in the manufacture of metal products did machinery come into greater use in the early factory; one such establishment had an imposing array of water driven slitting, pressing, shearing and rolling machines.

The progressive realization of the technical function of machinery completely revolutionizes the relations between labor and production (and social relations in general), a socio-economic development which increasingly conditions the nature of machinery. The creation and improvement of tools emphasized the primacy of labor in production by multiplying its skill; technology was essentially an accumulation of manual skills in the operation of tools. Machinery transfers skill to the machine, subordinating the worker to the mechanical equipment of produc-

tion; technology becomes essentially an accumulation of engineering skill and of machines and processes which tend to reduce the relative importance of manual skill.

The machine of the industrial revolution was basically a contrivance which mechanized existing tools and reproduced manual actions. Crocheting and knitting were mechanically combined in the stocking knitting machine of the seventeenth century. Prior to the invention of spinning machinery the spinner held a single thread between the thumb and forefinger, a process which was replaced by the movable carriage in Hargreaves' spinning jenny, which mechanized spinning. The rollers in Arkwright's spinning frame likewise were substitutes for the human fingers, twisting the yarn as it was wound on the spindles. The tool formerly held and operated by the worker was incorporated in the machine, which combined and mechanically operated a number of similar tools; the spinning jenny, for example, operated eight spindles simultaneously. Other machines might incorporate only a single tool, but the mechanization increased the speed, accuracy or capacity to produce. While the machines of the industrial revolution were essentially mechanized tools or their combination, this is true only in part and frequently not at all of a whole series of machines created by later technological development, which has also increased enormously the importance of apparatus, a means of production totally dissimilar to machines and tools.

Textile machinery was improved considerably during the sixteenth and seventeenth centuries and offered the most favorable technical and economic basis for the development of new machines. By 1745 the ribbon loom was practically automatic, the worker simply supplying power and stopping the machine to tie broken threads. One deficiency of the ribbon loom, the difficulty of controlling the shuttle operating through a wide web, was overcome by the flying shuttle. This invention, which was first used in the woolen loom, where it permitted weaving of wider cloth and cut in half the worker's labor, was by 1760 introduced in the manufacture of cotton cloth; the resulting increased demand for yarn and the rise in prices created greater interest in mechanical spinning. Many spinning machines had been built, but they were imperfect; the problem was finally solved by the spinning jenny and the spinning frame. The deficiency of the jenny in being able to spin only weft thread was rectified by the frame, which

spun both weft and warp, while Crompton's spinning mule combined and improved upon both, producing a finer, smoother and more elastic yarn.

Complete realization of the mechanical revolution required a new source of mechanical power. There had been no progress in this direction since the Italian turret windmill of the fifteenth century. Water power was used more and more, but it involved limitations in the location of industry and the relatively inefficient water wheels were incapable of moving very heavy machinery. The expansion of mining had led to important improvements in pumping machines and to an increase in mechanical and scientific knowledge which contributed to the invention of the steam engine. Early in the eighteenth century Newcomen devised a steam pumping engine. But this steam engine was limited to pumping in mines, until Watt transformed it by means of the separate condensing chamber and other improvements, which from reciprocating motion produced the rotary motion necessary to drive machines. The reciprocating steam engine promptly displaced human and water power in the driving of textile machinery. A single prime mover was now able to supply power to several working machines; and the factory became a weird maze of belts, ropes and pulleys whirling overhead and alongside the machines. Larger and more complex machines could now be constructed, and these in turn required more powerful steam engines, which created new problems concerning economy in the transmission of power and the design of machinery.

These developments depended upon and stimulated progress in metallurgy. Few metal parts had been used in the early machines; water wheels, windmills and the machines of the industrial revolution were constructed mainly of wood. But the steam engine and the new and heavier working machines required large amounts of iron. Metallurgical advances followed, combining mechanical and chemical features. The steam engine contributed directly to the transformation of metallurgy, being used to furnish power to the forge hammer and the blast.

The development of new techniques in metal working permitted the construction of larger, more complex and better designed machines. Considerable progress had been made in metal working tools, machines and appliances; power driven shears, rollers and hammers were widely used by 1750. But existing metal working machines were neither powerful enough nor

under adequate control; they lacked precision in producing the parts needed for the new machines, especially the steam engine. The construction of machinery had to become a function of machinery, increasingly independent of the skill and muscle of the worker; and machine tools, which shape metal into wrought forms by bending, pressing, shearing, paring, boring, had to be more powerful, larger and of greater precision. Improvements in the boring machine were of crucial importance as they made possible the manufacture of more accurate and larger cylinders and the construction of more efficient and powerful steam engines. Introduction of the milling cutter with its larger number of teeth, which eased the strain on each tooth as it cut, was of great significance because grinding machines had not yet been developed. Around 1800 came the power driven lathe; and the accuracy of its work was in turn enhanced by the slide rest, which was soon adapted to other machine tools. Where formerly the worker himself had held and guided the lathe's cutting tool, it was now held by the rest moving parallel with the work's axis, the worker simply turning a screw handle; the result was greater regularity of pressure and uniformity of work. Improvements in the screw were of great importance in the development of machine tools and heavy working machinery. The lathe and other machine tools were used to cut screws of more uniform thread, thus making interchangeable all screws of the same size. Planing, shearing, pressing and drilling machines were made larger and more precise in their operation. The production of more accurate machine parts led to accelerated manufacture of interchangeable standardized parts. A variety of small precision instruments were put to use; at the same time some machine tools were made larger and more powerful, among them the steam hammer and the massive lathes for machining the driving wheels of locomotives and the flywheels of steam engines.

The liberation of machine tools from the limitations of manual labor resulted in the transformation or disappearance of the tool formerly operated by the skilled worker. The slide rest, for example, replaced the highly skilled operator by a worker who had simply to turn a screw handle, and the worker himself was displaced when the slide rest was made automatic. On the other hand, machinery enlarged the scope of labor, quantitatively in the performance of heavier work and in higher output and quali-

tatively in greater accuracy. Machinery did work which labor could not do and did better the work which labor could do. New skills arose, particularly in machine shops, but they yielded gradually to more completely automatic machines. The construction of machines became increasingly dependent upon the technological application of science, where formerly it had proceeded largely by rule of thumb; its problems stimulated important advances in kinetics and thermodynamics, while engineering made ever greater demands upon mathematics, physics and chemistry.

New and improved working machines were called into being by technological progress and by the adoption of mechanical production in one branch of manufacturing after another. Not only were the earlier textile machines improved but new machines were created for other phases of the work, for mechanization of one process makes necessary the mechanization of other processes. By 1800 the power cotton loom, which produced a larger and finer output, was being introduced extensively and there were machines for mechanical cotton printing and wool combing. The Jacquard loom unified and improved upon elements of other looms; its system of cords simultaneously and automatically selected and moved the needed warp threads. This characteristic development of automatic operation was followed by contrivances to stop the machines when a thread breaks or when the shuttle bobbin is emptied of weft. In the 1880's a new type of spindle doubled the yield of spinning machines. By this time there was a large variety of machines which performed mechanically all operations involved in the production of textiles. A collateral development was the application of machinery to the production of garments, initiated by the sewing machine and followed by machines which sewed buttons, made buttonholes and cut cloth. Starting with the invention of the skiving machine in 1845, which mechanized the skiving knife, the manufacture of boots and shoes was within fifty years completely mechanized by an intensive division of labor and specialization of machinery based on one hundred operations and scores of machines. The manufacture of pulp paper, while essentially a product of chemical research and its industrial application, depended also upon extensive improvements in machinery; by the 1870's paper making was almost entirely automatic, employing relatively few workers. In a modern paper plant the machine is fed the fluid

pulp at one end and at the other emerges the rolled paper—all operations are automatic within the limits of the machine. In the making of steel the regenerative open hearth furnace speeded up the mechanization of all processes by means of machines of immense size, complexity and capacity. The molding machine transformed foundry work, and there was a parallel development of machines for the fabrication of steel. Use of the regenerative furnace with the continuous melting tank was followed within twenty-five years by the complete mechanization of glassmaking and the perfection of the astonishingly complex Owens automatic bottle machine. While the linotype machine substituted one skill for another, the printing press developed to the point where multiform operations may be performed automatically by one giant machine: in newspaper plants the paper is fed at one end and emerges a complete, folded newspaper of scores of pages at the other. The canning of foods involved the use of complex and almost automatic cooking and cooling apparatus, measuring devices and can packing machines. The milling, measuring and packing of flour was mechanized until only a relatively trifling labor force was necessary. In one industry after another machines inexorably invaded the province of manual labor.

Machine tools were early adapted to the production of a variety of metal wares: already before 1800 the milling cutter was used in the quantity manufacture of keys, and metal working machinery was applied on a large scale to the production of firearms, sewing machines, metal gadgets of all sorts and scores of devices for homes and offices which mechanized not merely manual skills but intelligence itself, as in the case of calculating machines. They were adapted also to the production of agricultural machinery, which, starting with improvements in the older implements and tools and the invention of the mechanical reaper, was augmented by a large variety of machines and implements. Woodworking machines, ranging from the cutting of logs to fine cabinetwork, were based on adaptations of the lathe, drilling, milling, grinding and other machine tools, mainly of the cutting type but much keener than those used on metal.

The construction of more and more diversified machinery could not have been accomplished without the increasing automatization of machine tools and advances in the manufacture of interchangeable parts. While the parts of ma-

chines became more complex and varied they also acquired more regularity, and this created new standards of efficiency and accuracy for machine tools. These standards were made possible after the middle of the nineteenth century by innumerable improvements in machine tools and particularly by the development of the turret lathe, the automatic screw machine and the milling and grinding machines. The turret lathe enhanced accuracy and control. The automatic screw machine, several of which could be attended by one worker, meant production of cheaper and better screws. The old milling cutter required frequent repairs because its shallow teeth were quickly rendered useless; the cutter of the new milling machine had greater cutting depth and could be kept sharp for a longer time and reground in its hardened state. Constructed in a variety of types, the universal milling machine displaced considerable manual labor, performed high quality work and was peculiarly adapted to mass production, since the rigidity of the cutting tool and its multiple edges permitted accurate and cheap reproduction of duplicate shapes and forms. Hand filing had been previously required but was now done more accurately and with less labor by improved machine tools. There were great advances also in planing machines and riveters; in presses for both hot and cold metal; in shearing, drilling and other machine tools. New tools developed, among them the pneumatic drill operated by compressed air, which works at tremendously high speeds and can be used in any position within the limits of its hose. Higher speeds and deeper cuts, more than doubling the output of a machine, were made possible by the introduction of high speed steel after the 1880's, and twenty years later machine shop practise was revolutionized by the increasing use of harder and more stabilized alloy steel for cutting tools. The greater the rigidity of the tool the greater the accuracy and automatic character of operation, hence the development of jigs, fixtures and other appliances (the screw wrench, angle plate, block, wedge, strap, clamp and bolt).

Meanwhile apparatus as a means of production became increasingly important as the technological application of chemistry created new and modified old industries. Apparatus is most highly developed in the chemical industry with its array of containers, pipes and similar contrivances but it is also of great importance in other industries which require one or more chemical processes. It was first used on a large

scale in the production and distribution of gas, in the chemical industry itself, in the manufacture of rubber and in the production of petroleum and its derivatives. With the development of synthetic products (dyestuffs, pulp paper, cement, celluloid, nitrates, rayon, regenerated and artificial leather and rubber, distillates of coal), in which the fundamental technology involves complex chemical action and precise control, apparatus attained still greater significance. It is of great importance in the derivation of by-products and it is required also for chemical processes in the manufacture of glass and soap, in blast furnaces, in the production of alloys and other industrial operations, in electrolysis. Production by means of apparatus implies more extensive and intensive exploitation of raw materials—the creation of a series of new products beyond the capacity of machines. Not much labor is required in such production, which is highly automatic; the workers are wholly unskilled, acting under orders of a handful of chemical engineers.

As machines became more automatic, transfer of skill and division and specialization of labor became more marked. No more than average manual dexterity and intelligence are necessary to "operate" automatic machines. Although there are machines which perform all the operations required to turn out one complete product, highly developed mechanical production is based on the "serialization" of machines, as in the case of the many machines used in the making of boots and shoes. The work to be performed is considered as a mechanical problem, split up into its separate and constituent processes, with a machine devised to perform each process, the work "flowing" from operation to operation and from machine to machine. The decisive consideration is neither the worker nor the machine but the process itself and its mechanization and progressively automatic performance. This principle, inherent in machinery, is most fully realized in mass production, where intensive specialization and serialization of machines and labor are supplemented by a considerable amount of auxiliary equipment—belt conveyors, trucks, portable conveyors and loaders, chutes and pneumatic and gravity devices, cranes, electric hoists, automatic counting, packaging and handling contrivances. Characteristic of mass production is the fact that in an automobile plant a spring formerly made by one mechanic is now made by thirteen processes involving eleven workers and a series of machines.

As in the case of the steam engine the development of new sources of power profoundly influenced the structure and operation of machines. Improvements in the steam engine, in the generation and transmission of its power, particularly in the form of the turbine, contributed enormously to the steady growth in the size and efficiency of working machines. The limitations of steam power were broken by the electric motor and the internal combustion engine.

Agricultural machinery was particularly influenced by the internal combustion engine. Steam power had been used to pull plows on large farms, but the results were unsatisfactory; the new oil engine was early adapted to the use of agricultural machinery, although limited because of its weight. But with the improvement of the oil engine and the construction of light tractors the way was opened for the intensive use of the new power on farms and their accelerated mechanization, especially after the introduction of the general purpose tractor. The tractor modified the older agricultural implements and machinery and forced the development of a multitude of new implements. The tendency is for the tractor to be adapted to the performance of all sorts of farm operations. Other changes in agricultural machinery were improved construction, better lubrication, more durable metals for cutting edges and wearing surfaces, easy manipulation and power lifts.

Electric power not only accelerated the mechanization of industry but greatly augmented the automatic character of machinery. Electric drive transformed the early transmitting mechanism of belts, shafts and pulleys. The advantages of electric group drive were at once apparent, especially in the elimination of engine attendance and of much of the wear and tear on bearings and belts. Still more advantageous was the individual drive with a motor for each machine; this made possible the most logical arrangement of machinery, of prime importance in serialization and mass production. It was but a short step to the designing and construction of motors adapted to the needs of particular machines; finally the motor itself became an integral part of the machine. The influence of electricity on machinery goes beyond the superiority of electric drive; it results in the designing of machinery in which the functions of control of speed, accuracy and quality are increasingly performed by electrical devices. The operation of machines is simplified and made more auto-

matic, particularly in the recent manifestations of remote control and in the workings of the photoelectric cell.

Recent developments in machine tools are characterized by their increasing size, complexity and simplified automatic control. Despite the use of light metals (also used to reduce stresses in high speed reciprocating parts) machine tools are becoming heavier—one combination drilling and boring machine weighs 70,000 pounds, requiring but a single operator who controls the entire machine by one push button station. Electric motors are being built into machine tools. Other tools are operated by hydraulic drive, although they still make use of electricity for control and other purposes. Machine tools are adapted to a variety of purposes; horizontal boring machines have been constructed which can be used for milling, drilling and tapping, while other machines perform multiple operations in one continuous process. Operation of these machines becomes increasingly automatic; in one boring machine four moves of a lever control the whole operation, and reversal of the lever releases the work. In other machines control is even more simplified and automatic. The parts of complex lathes are equipped with individual motors, the push button being used to switch them on and off. Pressure and precision are intensified; a steam platen press applies pressure of 20,000,000 pounds with a maximum deflection of the platens of not more than four thousandths of an inch; one boring machine makes a hole cylindrical to within one hundredth of a millimeter; and standard dimensional gauges are accurate to three millionths of an inch.

In working machinery recent developments are marked by greater rigidity and speeds and larger outputs, resulting in heavier and more complex machines. New types of machine are continually being introduced, involving a high rate of obsolescence. In rayon plants there are spinning frames on which every spindle is driven by its own motor, far outstripping the older mechanical spindles; indeed electrification has rendered rayon production practically automatic, including the chemical stages. Pulp paper production is under remote control, concentrated in a series of gauges and push buttons; temperatures and pressures are electrically regulated. All machines are practically automatic in the silk industry, with the exception of reeling, in which the operator still performs a large part of the work. In the chemical industry automatic

operation and remote control are highly developed. In rolling mills the electrification of main roll drive and controls has resulted in automatic continuous production. Stocking operations in blast furnaces are becoming completely automatic through electric control. Machinery has been devised for the continuous strip sheet rolling of steel sheets and tin plate, which was formerly done on hand rolls. Remote control is most highly developed in certain hydroelectric power plants, in which not a single worker is present and reports are made by automatic electric signals.

These developments in the construction and operation of machinery are not characteristic of all plants, but they are an ever growing tendency inherent in machinery. The fullest expression of this tendency is the machinery and the auxiliary equipment utilized in the mass production of automobiles, in which an elaborate development of the conveyor system is the basis of the working process, accompanied by the most intensive division of labor and specialization of machines. An opposite but complementary development is the increasingly large automatic machine which combines a series of operations formerly performed by separate machines, and which is the basis of the automatic plant. Automatic machinery, the increasing division of labor and specialization of machines and the automatic plant are completing the revolution in the relations between labor and production.

MACÍAS PICAVEA, RICARDO (1847-99), Spanish sociologist. Macías Picavea studied at León and at the universities of Valladolid and Madrid. He was a profound sociologist, extremely well prepared for the discussion of the evils afflicting Spain, the subject which constituted his constant preoccupation. The philosophic discipline which he acquired as a favorite disciple of the Krausist Julián Sanz del Río added precision and clarity to his powers of judgment. As a teacher of psychology, logic and ethics at the Instituto de Segunda Enseñanza of Tortosa and of Latin, geography and history at that of Valladolid he familiarized himself with the defects of Spanish education, which were among the principal bases of the national decadence. As a journalist he came in contact with the majority of the national literary, artistic and political problems and as an indefatigable traveler and geographer he acquired a full knowledge of the conditions of the peninsula. For a time he was in politics, professing democratic principles. But while he

saw the national defects clearly he did not allow himself to be dominated by pessimism, for he considered the fundamental conditions and characteristics of the nation to be good. He found the origin of the mischief in the deflection from the path of inherent development which had been suffered by the national life as a result of the Germanic background and orientation, especially the Caesarism, of the Austrian dynasty; in his time the resulting collapse reached its culmination in the defeat in the war with the United States, a disaster which he was among the first to foretell. When this occurred, he wrote with feverish anxiety and haste his greatest work, *El problema nacional* (Madrid 1899). Discounting the inevitable defects of a study which is so comprehensive—it exposes the reality of the decadence through an analysis of the national physical environment, population and cultural, educational, moral, religious, political and economic life and gives the causes and remedies for the decadence—it abounds in highly original observations and in judgments which have not been surpassed. The numerous, all embracing measures proposed include methods designed to restore the soil, vitalize education and revive and expand the traditional corporate, regional and local life of the nation and effect its participation in government. For the execution of the reforms Macías Picavea desired a tutelary dictatorship under the direction of a man of the hour. The book aroused great admiration among the intelligent. Whatever its intentions, it was among the outstanding examples of the "literature of 1898," which helped to evoke a feeling of deep pessimism, the prelude and in part the stimulus of the present national revival.

MACIEJOWSKI, WACŁAW ALEKSANDER (1793-1883), Polish jurist. Maciejowski's work may be said to have begun in 1820, when, called before a commission which was undertaking a revision of the laws of the Polish Kingdom, he demanded in accordance with the principles of the historical school that it should be based upon the native Polish law. When in 1832 he published the first two volumes of his major work, a history of Slavic law, he achieved almost instant renown. The work was translated into German and Serbian and a supplementary work on the

history, writings and legislation of the Slavs was translated into Russian and in part into French. Knowledge of the history of Slavic law was very elementary when Maciejowski began his work. He had to make himself acquainted with the printed sources of Slavic law and he even worked with manuscripts, publishing a number of valuable Slavic legal monuments, which until then had remained unknown. At a time when the interrelationship of the various bodies of Slavic law was not yet understood he showed that they arose from a common source of prehistoric Slavic legislation. Embracing in contrast to his predecessors—for instance, the Poles, Tadeusz Czacki, Jan Wincenty Bandtkie—a considerably wider number of sources and with his superior mastery of the historical method he was able to establish his thesis of the common origin of the Slavic laws by showing the analogies existing among them. He thus did away with the erroneous theory that the Slavic laws were taken over from alien sources. He also pointed out, as has been confirmed by further investigation, that Slavic elements were retained longest in Polish law. Despite some faults—he often allowed himself to be transported by fantasy—he nevertheless performed a tremendous service in stimulating the study of law among the Slavs and especially in Poland.

MCKENZIE, SIR JOHN (1838-1901), New Zealand statesman. McKenzie, a Scottish shepherd, emigrated to New Zealand as a farm laborer in 1860. He became a small landowner, won a seat in the provincial council of Otago and in 1881 was elected to Parliament. When the Liberal-Labour party, drawing much of its support from small farmers and farming aspirants, came into office in 1891 and embarked upon its experimental program he became minister of lands and he held this office until 1900. McKenzie's experiences as a crofter in Scotland had strongly convinced him of the right of a farming peasantry to have access to the soil, and his belief in the evils of landlordism was confirmed by the dummieing and other devices of land aggregation which were particularly rife in Otago and which were at that time aggravating an economic depression. He was largely responsible for the important measures of land reform carried through by Ballance's and Seddon's cabinets, measures not motivated by doctrinaire devotion to any theoretical conception but designed to meet a concrete situation. These measures provided progressive taxation of unimproved values; compulsory repurchase of land for closer settlement; the conservation of crown-land through the development of a revised leasehold policy with further limitation of areas alienable; credit advances to small farmers; and the creation of a Department of Agriculture. They were the chief means of creating a group of small state tenants and freeholders and of ending the economic deadlock, but they were aided by the advent of a period of rising prices and by the development of refrigeration for meat and dairy products. The most permanent and valuable aspects of McKenzie's program are the credit advances and the expert guidance provided by the Department of Agriculture. These have established themselves as governmental functions of almost unchallenged usefulness.

MACKENZIE, SIR WILLIAM (1849-1923), Canadian capitalist. Mackenzie was born at Kirkfield, Ontario, and during his early years was school teacher, merchant and lumber con-

tractor for the construction of several Ontario railroads. In 1884 he undertook large lumber contracts for the mountain division of the Canadian Pacific Railway and in 1888 in partnership with Donald Mann, H. S. Holt and James Ross began constructing the Canadian Pacific short line through Maine and important lines in western Canada. His close relation with Mann, a master railroad builder, the capital he acquired from railroad construction and the connections he made with financial and technical experts enabled Mackenzie to acquire large interests in public utilities in São Paulo, Rio de Janeiro, Monterey (California), Winnipeg and Toronto; in that field he was able to effect combinations bringing "into a harmonious union seemingly conflicting interests." He also acquired considerable interests in shipping, mining and life insurance companies.

In 1896 Mackenzie, definitely linked to the metropolitan activity of Toronto, entered the field of continental railroading by acquiring a small line in Manitoba. Thoroughly efficient at railroad building, his partnership met demands for railroads to compete with the Canadian Pacific and to open up sections of western Canada, which the Canadian Pacific had been forced to neglect by the necessity of following the southern route. To reach ocean ports and provide an outlet for the wheat trade his line, the Canadian Northern, was forced to build large non-remunerative stretches of road east and west; the line was completed against the pressure of governments and often by pressure on them. With the cessation of the land grant policy the Canadian Northern was compelled to rely on federal and provincial government guaranties of bonds and on the sale of common stock, but with the tightening of the capital market immediately prior to the World War and the wartime decline in immigration survival became impossible. In 1918 the insolvent Canadian Northern gave way to the Canadian National Railways. Despite the line's failure Mackenzie by securing efficient engineers, by cautious financing, by developing traffic and by securing capital at low rates had contributed substantially to the eventual success of the Canadian National Railways. He played a vital role in the expansion and growth of urban and pioneer communities which took place from 1900 to 1914.

MACLAY, WILLIAM (1737-1804), American politician. Maclay was in many respects a typical product of the piedmont region. The son of a Scottish immigrant, he was born in New Garden township, Pennsylvania, and passed most of his life in the Susquehanna valley, residing on a farm near Harrisburg. He worked as lawyer, farmer, surveyor and land speculator, supported the revolution and after it held various legislative and judicial posts. In January, 1789, the Pennsylvania legislature elected him to the United States Senate, where he served until 1791. During his short term Maclay kept a journal in which he recorded caustically and with elaborate care the proceedings of the upper house of the First Congress of the United States. This work is not only an invaluable source for the political and social history of the period but it also indicates clearly the economic reasons behind the formation of the Federalist and Republican parties. As a western Democrat Maclay came into conflict with the dominant mercantile group in Philadelphia. This hostility was quickly extended to similar groups in New York and New England, and the antagonism was sharpened by his Anglophobia, agrarianism and devotion to states' rights. Every important Federalist measure except the tariff of 1789 met with his unqualified condemnation. The judiciary bill was the "gunpowder-plot of the Constitution"; the funding system he called "that political gout of every government which has adopted it"; the establishment of a national bank and the assumption of state debts were schemes of shameless speculators; the excise was a Pandora's box of civil strife. Federalism, in his eyes, was a way station on the road to monarchy.

Because of his bitter opposition to the Hamiltonian system it has been claimed that Maclay was the founder of the Republican party; but this contention has little validity. His suspicious nature and dour individualism prevented any real cooperation with Jefferson and Madison, who emerge from his pages with little more credit than do Hamilton and Adams. Professing

to be guided by principle alone, he was profoundly affected by personalities; and rheumatism made him misanthropic. His brief senatorial career ended without the attainment of any of his purposes, one of the most important of which was the location of the national capital on the Susquehanna River; but Maclay had his revenge on his political enemies in his brilliantly written *Journal*.

McLENNAN, JOHN FERGUSON (1827-81), Scottish ethnologist. McLennan became a member of the bar in Edinburgh in 1857 and for some time after 1871 served as parliamentary draftsman for Scotland. While writing the article "Law" for the eighth edition of the *Encyclopædia Britannica* in 1857 he became interested in the Spartan and Roman marriage ceremony of collusive abduction, which he interpreted in terms of the evolutionary hypothesis that symbolical forms of behavior were survivals of previous actual relationships. He developed the theory that female infanticide among primitive hordes led to a scarcity of women and therefore necessitated marriage outside the tribe, a practise which he designated as exogamy. Contending that only after a considerable advance in civilization did tribes join in political union permitting peaceful intertribal marriages, he held that wives could be obtained only by capture, the forms of which survived as symbols after force was no longer necessary. Subsequent research has proved that McLennan exaggerated the extent of infanticide and the prevalence of marriage by capture; although his term exogamy has become incorporated into the vocabulary of anthropology, his explanation of its origin is now regarded as untenable. Independently of Bachofen and Morgan, McLennan controverted the hypothesis, put in its most cogent form by Maine, that the patriarchal family was the original basic unit of social organization; he argued that an original promiscuity was superseded by the tracing of kinship through the female line, a practise which universally preceded descent through the male line, because of uncertain paternity involved in polyandry. He interpreted the levirate as being derived from polyandry. In his bitter attack on Morgan he

failed to grasp the sociological significance of kinship terms and held them to be merely terms of address. McLennan's controversies with his contemporaries gave impetus to significant research into the social organization of primitive societies.

MACLEOD, HENRY DUNNING (1821-1902), English economist. Macleod is one of the more remarkable of that great number of self-made economists who, discovering certain problems neglected by orthodox economists, believed that it was their task to rebuild the science from its foundations and who by attempting to do so with insufficient equipment failed to secure recognition even for their real contribution. He was the son of a large Scottish landowner and prominent free trader parliamentarian and was trained as a lawyer. As chairman of a local committee on the poor law administration he distinguished himself at a relatively early age by recommending and successfully establishing the first poor law union in Scotland. His interest in economics as a science did not begin until 1854 when immediately after his acceptance of a directorship of the Royal British Bank he found himself engaged in a law case on the powers of the bank under the Joint Stock Banking Act of 1845. This case led him into extensive historical and theoretical studies, which were, according to a characteristic statement of his later years, "the origin of the modern Science of Economics." The first product of these studies, *The Theory and Practice of Banking* (2 vols., London 1855; new ed. 1902-11), is his most important work. Its exposition of the historical development of the policy of the Bank of England has long been the only convenient source of information for the study of those problems; even at the present time it has not been completely superseded. On most points Macleod adheres to the theories of the Bullion Report and he was one of the first to obtain a clear grasp of the role of discount policy. Of relatively less importance are his rather vague views on the relation

between credit and capital, which were widely discussed and severely criticized. He insisted that the essential function of the bank was as a "manufactory of credit" and was probably the first to give a detailed account of the process by which bank credit is created (see particularly the article "Credit" in his *Dictionary* . . .). It is noteworthy, however, that his theories never led him, as might have been expected, to advocate unsound maxims of monetary policy.

From *The Theory and Practice of Banking* he proceeded to an attempted reconstruction of economic science in general, frequently restating his views on books whose titles were changed but whose subject matter was only slightly modified. A typical disappointed innovator, his distaste for the dominant school of economics was increased by repeated failures to obtain a university chair. The fact that after the disastrous failure of his bank in 1856 he with his fellow directors had been charged with a conspiracy to defraud and found guilty made his position still more difficult. In his theories, which were sometimes very ingenious but never completely worked out, he followed Lauderdale, Bastiat and Bailey and, particularly in his discussion of the theory of value, he had glimmerings of ideas which were later developed by the marginal utility and the mathematical school. Of the projected two volumes of his *Dictionary of Political Economy* (London 1858-63) only the first was published, but a portion of the material collected for it appears to have been used for his *History of Economics* (London 1896). In general Macleod found more recognition abroad, especially in France, than in England, although the British government employed him from 1868 to 1870 to prepare a digest of the laws relating to bills of exchange.

McMASTER, JOHN BACH (1852-1932), American historian and university professor. McMaster's reputation as a historian rests mainly upon *A History of the People of the United States from the Revolution to the Civil War* (8 vols., New York 1883-1913; new ed. 1927-29). The publication of the first volume gained for the author instant recognition and an appointment by the University of Pennsylvania to the chair of United States history, one of the earliest of its kind. During his forty years in the classroom and in the seminar he exerted a deep influence on his students, and a notable group of American historians acknowledges its debt to his instruction.

Influenced, it would seem, by the work of J. R. Green in England, McMaster determined to throw the major emphasis on the people of the United States rather than on the nation as a political entity. Although he was unable to maintain this distinction, his early volumes, which are probably the best of all his work, widened historical horizons by their stress upon social and economic history, their attention to the everyday life of ordinary folk, their appreciation of the importance of the frontier and their demonstration of the value of newspapers as guides to the past. They made clear to American historians that "the growth of democratic ideas had given dignity to the study of the individual."

McMaster's reliance upon the press, however, affected the balance and arrangement of his chapters and adversely influenced his style, which at the outset he had attempted to model on that of Macaulay. Space is too often allotted to the picturesque and the unusual at the expense of the more broadly significant currents; emphasis is produced by long quotations and the massing of details, and summaries are noticeably few. Because the manner and not the meaning of events is stressed, the narrative frequently lacks both relief and perspective.

McMaster's inclusive view of history places him among the founders of the "new" school of historians; while his evident patriotism, his belief in the superior virtues and manifest progress of Anglo-Saxons in the United States since 1776, his partiality for analogies between the "then" and the "now" and his chary use of footnote citations link him with his predecessors.

WILLIAM T. HUTCHINSON

Other important works: *With the Fathers*; *Studies in the History of the United States* (New York 1896); *The Acquisition of Political, Social, and Industrial Rights*

of Man in America (Cleveland 1903); *The Life and Times of Stephen Girard, Mariner and Merchant*, 2 vols. (Philadelphia 1918); *The United States in the World War*, 2 vols. (New York 1918-20); *A History of the People of the United States during Lincoln's Administration* (New York 1927).

Consult: Paxson, F. L., "The New American History" in *Quarterly Review*, vol. cxxiii (1915) 159-81; Fish, C. R., "Review of McMaster's History of the People of the United States," and Hutchinson, W. T., "John Bach McMaster, Historian of the American People" in *Mississippi Valley Historical Review*, vol. i (1914-15) 31-43, and vol. xvi (1929-30) 23-49.

MCNEILL, GEORGE EDWIN (1837-1906), American labor reformer. The son of a Scotch-Irish immigrant who was an active antislavery propagandist, McNeill went to work at fifteen in a textile mill in Amesbury, Massachusetts, and later tried shoemaking, salesmanship and other occupations. In 1856 he removed to Boston, where he came in touch with the reformers interested in the shorter hour movement. Influenced by Ira Steward's theory that shorter hours increase wages by creating new wants, he organized and agitated from 1863 to 1874 for the eight-hour day. He was active in most of the reform societies which followed the Civil War and the panic of 1873. From 1884 to 1886 he was secretary-treasurer of the Massachusetts district of the Knights of Labor and struggled against the split of 1886 between the Knights and the trade unions. He helped organize the American Federation of Labor and in 1898 was its fraternal delegate to the British Trades Union Congress. In addition to writing for a number of labor papers he edited and largely composed the first real attempt at a history of the American labor movement.

He was first deputy of the Massachusetts Bureau of Statistics of Labor from its establishment in 1869 until 1873, and he served on state commissions on education, tax revision and uniform legislation. As candidate for mayor of Boston in 1886 he received about three thousand votes. In mid career he became an insurance agent and in 1883 organized the Massachusetts Mutual Accident Insurance Company, of which he was general manager from 1892 until the time of his death.

His career is illustrative of the social order and trend of the United States in the nineteenth century. To rise from a mill hand into the middle class by way of reform, politics, journalism and business was not uncommon. The limited nature of McNeill's reformist ideas was typical, and only his retention of labor sympathy distin-

guishes him from many who moved in a like direction.

MACONOCHIE, ALEXANDER (1787-1860), English prison reformer. In 1840 Maconochie, a captain in the Royal Navy, became governor of the penal colony at Norfolk Island, Australia, to which notorious convicts were transported from England. He found the colony to be a veritable hell hole in which mutinies, crimes and vice abounded. Maconochie instituted a series of reforms which he had already enunciated in tracts on penal reform. His chief innovation was the mark system, under which each prisoner upon entrance was debited with marks depending upon the gravity of the offense; these marks were redeemable by good conduct, and when all were canceled the prisoner was considered for conditional release on "ticket of leave." The daily redemption of marks was also used as a credit against which the prisoner could draw food and supplies. The aim was to inculcate thrift and a sense of relative values. Maconochie's ingenuity expressed itself also in other penal reforms, such as the employment of music as a reformatory agency, provision for the cultivation of gardens by prisoners and the institution of a rudimentary system of inmate self-government. Maconochie's reforms were incorporated by Sir Walter Crofton into the Irish system of reformation and thence with modifications into the American reformatory regime. Maconochie's penal philosophy was: "Restrain men rather by making virtue easy, and good conduct pleasant, than merely by making vice difficult, and misconduct painful." After a brief period in charge of the Borough Prison of Birmingham, Maconochie was removed because the magistrates objected to his opinions as being "too abstract."

SHELDON GLUECK

Important works: *Thoughts on Convict Management, and Other Subjects Connected with the Australian Penal Colonies* (Hobart Town 1838); *Crime and Punishment* (London 1846); *The Mark System of Prison Discipline* (London 1855); *On Secondary Punishment* (London 1848).

Reformatory Prison Discipline as Developed by the Rt. Hon. Sir Walter Crofton, in the Irish Convict Prisons (London 1872).

MACQUARIE, LACHLAN (1761-1824), Australian colonial administrator. Macquarie, a Scottish infantry colonel, became governor of New South Wales after the Bligh mutiny of 1808 and ruled the young colony through the important period from 1810 to 1821. He changed the entire point of view regarding the Australian settlements. In his own words, he found a jail and left a colony. The change was partly due to his great material achievements. He restored order after the lax conditions permitted by the naval governors, promoted exploration, opened up the new lands across the Blue Mountains, established a bank of issue and carried out public works on an unprecedented scale. More important, however, was his contribution to the status of the colonists. He argued that the future of the colony lay with free men and that every convict, once he had satisfied his sentence, should start afresh and receive all the rights of free men. This was a revolutionary attitude in a convict colony, where both expees, who had served their term, and emancipists, who had been released on probation, were viewed as definitely inferior politically, socially and morally. Despite the opposition of officials and free settlers he appointed expees and emancipists to important offices, including magistracies, and he made a strong fight for the right of emancipist attorneys to practise in the courts of the colony. The Parliamentary Committee on Transportation praised Macquarie's convict policy in 1812, but numerous complaints eventually led the Colonial Office in 1819 to order an inquiry by Commissioner Bigge into the affairs of the colony. Bigge reported adversely on Macquarie's administration, but Macquarie's cause eventually won. Australia became not a jail but an oversea dominion of free men associated on an equalitarian basis.

STEPHEN H. ROBERTS

Consult: Phillips, Marion, *A Colonial Autocracy*, London School of Economics, Studies in Economics and Political Science, no. 16 (London 1909); Jose, A. W., *Builders and Pioneers of Australia* (London 1928) p. 3-35.

MACVANE, SILAS MARCUS (1842-1914), American economist. MacVane was born in Prince Edward Island and graduated from Acadia College in 1865 and after an interval of teaching graduated from Harvard College in

1873. After another interval of teaching he became in 1875 instructor in political economy at Harvard and remained with that institution until his retirement in 1911. He shifted early from political economy to history, becoming assistant professor in the latter subject in 1883 and professor in 1886. His activity as a teacher covered a wide range of work. He taught in straightforward and effective fashion economics, history, international law, constitutional law, modern government, political theory.

All MacVane's work was characterized by sound sense, sober and discriminating judgment, simplicity of statement, wide information but no deep scholarship. His intellectual interests were those of the English don rather than of the German professor. He took an active part in the administrative work of Harvard College and indeed made himself indispensable in some parts of it. In 1890 he published *The Working Principles of Political Economy* (2nd ed. New York 1897) and subsequently in 1899 a translation and revision of Seignobos' *Histoire politique de l'Europe contemporaine*. Among periodical articles were a paper on the "Austrian Theory of Value" in the *Annals of the American Academy of Political and Social Science* (vol. iv, 1893-94, p. 348-77) and a number of articles on theoretic subjects in the *Quarterly Journal of Economics*. The most notable of these latter were those which criticized the economic theories of Francis A. Walker, then recently put forth.

MacVane was clear headed, a good straight reasoner after the fashion of the older school, a keen and dangerous critic, a user and fashioner of old ideas rather than a creator of new ones. In his best work, the debate with Francis Walker in the *Quarterly Journal of Economics*, he showed the weaknesses upon the other side but was not himself free of the weaknesses which ran through the traditional and conservative thought of his time, and advanced matters little. His *Working Principles*, originally designed as a textbook, served its purpose well as a simple yet by no means superficial exposition of the best in the conservative thought of his day.

FRANK W. TAUSSIG

MACY, ROWLAND HUSSEY (1822-77), American merchant. Macy established a shop for fancy goods in New York in 1858 and added a millinery department in 1863. He had added six more departments by 1869 and in 1877 had a total of twenty-one. Although data are scarce, economists tend to believe that American stores

were not departmentalized until after 1850 and that widespread adoption of departmentalization began during the panic of 1873. Macy was unquestionably the pioneer in the development of the American department store, but it is difficult to say just how much he copied from the Bon Marché of Paris, which he greatly admired.

Macy adopted the fixed price policy, which was still exceptional, in 1858 and originated the shaded price policy—\$1.98 instead of \$2.00—in order to prevent thefts by employees. These two policies have come into general use because of their effect on customers. His most striking innovation was cash buying and selling. Few department stores have imitated the policy of buying as well as selling for cash which has been followed by R. H. Macy & Co. with slight modifications for over half a century. To what extent this policy has contributed to the success of the store it is impossible to say; the heads of the firm have maintained that Macy prices are low "because we sell for cash only."

A year after Macy's death the store passed into the hands of C. B. Webster and Jerome B. Wheeler. In 1887 it was purchased by Isidor and Nathan Straus and it is now organized as a corporation controlled and operated by their children.

MADERO, FRANCISCO INDALECIO (1873-1913), Mexican politician. Madero, a member of an influential land and mine owning family, was educated in Mexico, France and the United States. In his political ideas he was a not very remote descendant of the liberal nationalists who had framed the federalist constitution of 1857. He entered politics by supporting local opposition candidates in the decade when Mexico was becoming much concerned with its fate after the aged dictator Díaz should disappear from the scene. The growing economic and political imperialism of the United States augmented this concern. In 1908, when political agitation was stimulated by the president's indication that he intended to restore constitutional government, Madero published a book, *La sucesión presidencial en 1910*, opposing his reelection. It protested against Díaz' establishment de facto of a centralized absolutism which had resulted

in corruption and favoritism in administration; despoilment of Indian lands and enslavement and extermination of the Indians; oppression of labor; neglect of agriculture; mass ignorance and drunkenness; and excessive servility toward the United States. According to Madero, the cynical, corrupt and materialistic despotism weakened patriotic sentiment and menaced national safety. Nevertheless, he was appreciative of the material progress achieved under Díaz, although he attributed it to developments throughout the world. He praised the Porfirian peace, which, he concluded, made possible the restoration of democracy, whose greatest enemy was not the ignorance of the masses but militarism. As neither the dictator nor those who were groomed as his successors could be relied upon to restore the constitution, he called upon Mexicans desiring to maintain the national morale and to avert bloody revolution to organize a political party which should struggle peacefully for the triumph of free suffrage and the principle of no reelection. The book reveals the essentially political and humanitarian character of Madero's thought and suggests but few concrete measures of social reform; before everything the constitution, which represented the national aspirations, must be reestablished. Madero's economic thought consisted largely of an admiration for Díaz' treasury surpluses. He possessed considerable insight into the workings of the dictatorship but he failed to understand the character of the national social structure and the superficiality of the Porfirian peace, during which there developed conditions favorable to intense class and racial struggle.

La sucesión presidencial en 1910 exerted a great influence and its author became the presidential candidate of the Anti-Reelectionist party. He was arrested and Díaz was reelected in July, 1910. Released from imprisonment, Madero proclaimed the revolutionary "plan of San Luis Potosí," dated October 5, which declared the elections illegal and promised the restitution of lands wrongfully taken. In May, 1911, Díaz was overthrown by those who for various reasons opposed the *Científico* regime, by the disinherited who were attracted by the new era envisioned by Madero, and by economic depression. In October Madero was elected president. Once in office the "apostle" of the revolution, idealistic, inexperienced, a poor executive, surrounded by members of his family and other representatives of his class, demonstrated his inability to effect the radical reforms which

the masses awaited with impatience. At the same time that the agrarians were alienated, counter-revolutions broke out on behalf of ambitious militarists, landholding elements and foreign, especially American, capitalistic interests. Madero was treacherously overthrown and assassinated; reaction triumphed under Huerta.

MADISON, JAMES (1751-1836), American statesman. Madison was the inventive genius in the formation of the American political system, and by reason of the influential role which he played in the federal convention has been called the father of the constitution. His classical training as an undergraduate at Princeton was followed by graduate work centering around a minute study of Montesquieu and the reading of Hobbes, Locke, Sidney, Pufendorf and other writers on political science. He was essentially a scholar in politics, blending together vast knowledge and profound insight into human nature.

In the federal convention and in his numerous contributions to the *Federalist* he advocated a system of government in which democracy should be reconciled with the security of private rights. He saw that the central problem of democracy is not the maintenance of equality but the preservation of liberty. Subscribing to Locke's labor theory of property he attributed the sacredness of property rights to their labor origin. Property rights should not overrule personal rights, and thanks to the wide diffusion of property in the United States the power of property to oppress liberty was, Madison thought, a remote contingency. Property at that time was chiefly in the form of land; but Madison foresaw with no little clarity that if other forms of property should arise through the growth of manufactures and commerce, the majority of citizens would become dependent on the wealth of a few and society be divided into a large number

of indigent laborers and a few wealthy capitalists. The extreme individualism with regard to property rights fostered by Madison has been enhanced by the Fourteenth Amendment.

Madison believed that democracy could be reconciled with the security of private rights if the factional spirit could be curbed. But the causes of faction he traced to the nature of man, where latent dispositions are brought into different degrees of activity according to the different circumstances of civil society. Although these causes could not be removed, the control of the effects was within human power. "Enlarge the sphere," said Madison, "and thereby divide the community into so great a number of interests and parties, that in the first place a majority will not be likely at the same moment to have a common interest separate from that of the whole or of the minority; and in the second place, that in case they should have such an interest, they may not be apt to unite in the pursuit of it." Madison's ideal was that of a balanced government as set forth by Montesquieu; the equilibrium of power which the latter had thought necessary to balance the enormous preponderance of royalty in England Madison conceived to be equally essential in the United States as a restraint upon temporary majorities in pursuit of their selfish interests.

As an outstanding anti-Federalist he displayed polemic skill, particularly in his contribution to the Virginia and Kentucky Resolutions of 1798; and along with his collaborator and ever congenial intellectual intimate, Jefferson, helped to carry over into a more complicated era the ideals of agrarian democracy. His later political career as secretary of state under Jefferson (1801-09) and as president of the United States (1809-17) although involving him in many historically significant situations, such as the Louisiana Purchase and the War of 1812, was less productive of systematic ideology.

MADOX, THOMAS (1666-1727), English archivist and historian. Madox studied law at the Middle Temple but was never admitted to the bar. He was employed as a clerk in the office of the lord treasurer's remembrancer and in the Augmentation Office and in 1714 was made historiographer royal to Queen Anne and King George I. He was one of the official custodians of the national records, and the character of his first book, the *Formulare anglicanum* (London 1702), was determined largely by the nature of the records under his charge in the Augmentation Office. The text of this book consists of a large collection of mediaeval charters; but its peculiar importance lies in its introduction, wherein Madox discussed the structure of such documents in a manner never before attempted and not yet superseded. Madox is in fact the founder of the diplomatic study of the English private charter. His *The History and Antiquities of the Exchequer of the Kings of England* (London 1711; 2nd ed., 2 vols., 1769) was the first detailed history of one of the great English departments of state. In this work Madox submitted the pipe rolls of the twelfth and the early thirteenth century to an analysis which revealed the many sided activities of the mediaeval English Exchequer. It was the starting point for all subsequent research into the administration of England under the first Angevin kings. Although all the continuous records of the Exchequer are now in print down to the year 1198, the *History of the Exchequer* is still of great value as a study of Exchequer practise and as an index to the contents of the unpublished records of this department in the thirteenth century. The third of Madox' chief works, the *Firma burgi* (London 1726), is essentially a study of the financial relations of the English boroughs with the crown, illustrated like the *History of the Exchequer* by extensive quotations from national records, still in great part unprinted; the same method was employed in his posthumously published *Baronia anglica* (London 1736), an inquiry into the legal significance of baronial tenure in England.

Although the whole of Madox' significant work was published after 1700, he is allied in spirit to the great English historians of the seventeenth century and is indeed among the most eminent of that company. He rarely passed beyond the range of the materials which lay at hand in the national records of England, but he always regarded his record work as the illustration of history, which to him was the disinterested reconstruction of the past. The results

of this attitude are that the reputation of his work has suffered little from changes of fashion in historical writing, that it has influenced all subsequent research in related fields and that it still stands as a model of minute investigation in which the details are never allowed to obscure the wider view.

MAFFI, ANTONIO (1850-1912), Italian cooperative leader. Maffi was born in Milan and was self-educated. He engaged in the printing trade and achieved prominence through his abilities as propagandist and organizer. Inspired by Mazzini's idea of "association and liberty" as the solution of social problems, he argued for cooperation and mutualism based upon education, self-sacrifice and solidarity. He condemned the opposition of the ruling class to the peaceful improvement of working class conditions, which he regarded as the only real class struggle, advocating cooperation and mutualism as a constructive remedy and opposing the Marxian idea of class struggle. He helped to indoctrinate the cooperative movement with a class collaborationist philosophy not challenged until 1920, when the movement allied itself with socialism.

The first workman to be elected to the Italian national Parliament, Maffi actively supported ameliorative social legislation, especially in aid of producers' cooperative societies, and was largely responsible for a law empowering workmen's associations to undertake contracts for public works under very favorable conditions. In 1886 he helped promote the first congress of Italian cooperative societies, in which eminent Italian and foreign cooperators took part. The result was the founding of the Lega Nazionale delle Cooperative, of which he was general secretary and presiding genius until his death. He organized the "triple alliance" of cooperatives, mutualists and trade unions for joint legislative action aiming at the legal and economic enfranchisement of workers. Against the view held by many socialists that cooperation was futile he argued that by penetrating all economic and social life and by affecting production, exchange and legislation cooperation could provide a real solution to social problems. His view of coop-

eration as a powerful instrument of international peace and brotherhood became basic in the International Cooperative Alliance, and he lived to see right wing socialists converted to the cooperative idea.

FELICE MANFREDI

MAFIA. The Sicilian word mafia is not found in Italian writings before the nineteenth century. Traina's Sicilian-Italian dictionary (1868) defines it as a neologism denoting any sign of bravado, a bold show; Mortillaro's dictionary (1876), as a word of Piedmontese origin equivalent to gang (*camorra*). Neither definition is exact. The word is employed by Sicilians in two different although related senses: on the one hand, it is used to denote an attitude which until recently has been fairly widespread among certain classes of Sicilians; on the other, it signifies a number of small criminal bands.

Mafia describes the attitude which assumes that recourse to legal authority in cases of persecution by private enemies is a symptom of weakness, almost of cowardice. It is an exaggeration of the sentiment, more or less common in Latin countries, that appeal to law against offenses involving personal insult, for instance adultery, is unmanly and that the duel is the proper means of recovering lost honor. Sicilian circles affected by mafiist psychology held that many offenses must be avenged by personal action or by that of relatives and friends. Common theft, for example, was considered a sign of lack of respect indicating that the thief did not fear vengeance.

The mafiist attitude, of which there were many degrees, was common in western Sicily and almost unknown in the eastern provinces, particularly Messina and Syracuse. It was practically non-existent among educated people as well as among the large class of sailors and fishermen and rare among all urban classes. It was most firmly rooted among peasants and large landowners.

By no means all people with such sentiments were actual or potential criminals. The great majority violated no law. When a person sharing mafiist sentiments had relations with criminals he was usually actuated by a desire to prevent offenses against himself and not to commit them against others. The most serious consequence of such a tendency was the fact that refusal to report offenses to constituted authorities, which

would have been contrary to the mafist moral law of *omertà*, prevented the capture of criminals by the state and thus facilitated the formation and activities of bands of malefactors.

Mafia was never a vast association of malefactors with a hierarchy of leaders and ramifications throughout Sicily. In this respect it differed sharply from the highly unified Neapolitan Camorra, with which it had no relationship except that of similar criminal objectives. Mafia consisted rather of many small autonomous associations, each active over a limited district. Each association was a *cosca* (Sicilian dialect: *tuft*), generally having a membership of twelve to fifteen, although some were larger. There was no election of chiefs, authority being wielded by members long addicted to crime, who directed the movements of younger associates, superintended dealings with victims and divided booty. Insubordination and especially misappropriation of booty were considered violations of mafist honor and punished, sometimes with death. The relations between neighboring *cosche* might be cordial or so antagonistic that difficulties would have to be settled by shooting. The great majority of mafist murders grew out of rivalry between *cosche* or members of one *cosca*. While it is untrue that members of the various *cosche* used conventional words and gestures to recognize one another, they did have peculiar mannerisms, including pronunciations of certain words, frequent use of others, and a certain furtive and shuffling expression. To any experienced Sicilian these betrayed connection with a *cosca*.

The *cosche* engaged chiefly in cattle rustling, extortion and occasional kidnaping for ransom. Often an ally of the *cosca* would offer to recover stolen cattle for the owner, and if such an offer were accepted the cattle would soon be found wandering about the countryside and the "friend" would be indemnified for his "expenses" to the extent of a third or a half the value of the cattle. In regions where agriculture was intensive, a tribute system prevailed. Every landowner or tenant paid to the *cosca* an annual tax higher than the combined imposts of the state, province and commune. Refusal to pay was punished by destruction of trees and vines and the slaughter of livestock. Letters demanding the deposit of a sum of money at a designated place or its consignment to a designated messenger were a method generally used by novices. Kidnaping of wealthy individuals for ransom fell into disuse some twenty years ago because

of its difficulty. No woman or baby has been kidnaped for a decade, and no kidnaped person has been killed for three or four. The police have generally suspended efforts to discover the kidnapers until the victim has been freed. A *cosca* through more or less veiled threats would often induce a landowner to entrust the marketing of produce to one of its members or to lease his estate to persons in their confidence. In the first case small thefts by novices not associated with the *cosca* were prevented, a part of the produce being appropriated as payment by the *cosca* itself. In the second case a rebate, often half the lease price, was extracted.

In cattle rustling, the most common offense, two *cosche* collaborated. Stolen oxen and sheep would be dispatched to a commune fifty or more kilometers away, secretly butchered and consumed. Stolen horses and mules were sometimes sent as far as Tunis, where the mafists had connections with Sicilian emigrants. *Cosche* also have had close relations with criminal bands in the United States whose members were ex-mafists. A letter sent from America to a notorious Sicilian mafist announced a murder committed during its transit. The murder of a New York City police lieutenant, Petrosino, at Palermo in 1909 was perpetrated in cooperation with mafist criminals in America.

About 1878 Prefect of Police Malusardi, in whom the minister of the interior vested authority over all Sicily, exiled to the coastal islands several hundred criminals against whom precise evidence was lacking. Later, however, the *cosche* reorganized and perfected their methods of operation, and most of their members practised a trade from which they appeared to live. The government was long powerless to stop their crimes. Although the mafist chiefs were fairly well known, the police could offer no evidence but popular report. Few persons dared appear against the criminals. Even when a chief could be identified he could prove an alibi, and the youths who actually had perpetrated offenses were unknown. When the latter were arrested they rarely informed on those who had ordered them to commit an offense, for they would then not only be condemned but would also forfeit mafist honor and the help customarily given by the *cosca* to captives of the police.

But the chief obstacle to legal action was the political influence of the mafists, who in some communes dominated political elections. This power developed after the first important extension of the franchise in 1882 and increased after

universal suffrage was adopted in 1912. The poorest classes, now given the vote, were by no means most largely represented in the *cosche*; but because of ignorance and fear they yielded most easily to mafiist threats and supported candidates endorsed by mafiists. The *cosche* required their legislative tools to obtain for their members permission to carry weapons, to intercede with the police in their favor and to serve them in other ways. The question of public safety in Sicily was repeatedly discussed by the chamber and all ministers of the interior instructed the prefects of police to make no compromise with crime. Most ministers, however, also recommended support of the parliamentary candidacy of a mafiist tool, and the prefects often carried out the second instruction while ignoring the first.

During recent years the mafiist attitude has weakened. Immediately after the World War the general confusion and the ambitions of the younger members of the *cosche* to gain control led to a recrudescence of mafiist activities and a series of murders within the *cosche*. Beginning about 1925, the Fascist government undertook a rigorous war against the mafia. In this struggle it was aided by the weakening of mafiist sentiments resulting from the wider diffusion of culture and of material comforts and the more frequent contacts with the continent which followed upon the improvement of transportation and communication. The government pushed the fight with vigor and success, inducing victims to give sufficient proof to bring about many arrests and convictions. The Fascist system of appointing members of the legislature prevents mafiist influence on elections. Today conditions of public safety in Sicily may be considered normal.

MAGDEBURG CENTURIATORS. The Magdeburg centuriators, of whom the leader and organizer was Matthias Flacius Illyricus, were the authors of the principal historical work pro-

duced by German Lutheranism in the Reformation period. The *Magdeburg Centuries* were planned by Matthias and other strict Lutherans who had gathered in Magdeburg to meet the crisis growing out of Emperor Charles v's attempt to follow up his victory over the Protestant Schmalkaldic League in 1547 and to reestablish Catholicism throughout his entire realm. The centuriators conceived the work as a comprehensive history of the church which should demonstrate that the Lutheran doctrine was the true doctrine and that the Roman papacy had been created and developed by Antichrist. When they had completed an exhaustive investigation of sources in numerous libraries outside of Germany as well as within, they subjected the material to historical criticism and then arranged it by centuries (whence the name). Only the first thirteen centuries of the Christian era were included. The various *Centuries* were uniformly divided into separate sections treating such subjects as church doctrine, ritual, discipline and government, learning, heresies, persecutions and martyrdoms. As a result of its arrangement the work lacks internal unity. Its principal significance for the development of historiography lies in the fact that the centuriators appreciably augmented the volume of hitherto known historical materials and that they applied to the treatment of this material the fundamental canons of humanistic historical method. They manifested due cognizance of the importance of social matters, expounding the relations of the church to society and to non-Christian religious associations as well as to the state; they made exhaustive investigations of the structure of the organizations produced by the church; they evaluated the influence of the Christian precept of brotherly love upon the practise of charity. Never before had such questions been treated in a great and connected church history. In estimating the intrinsic value of the work, however, it must be remembered that it was tendentious in the extreme. The centuriators never permitted their canons of historical criticism to lead them to a judgment adverse to their position. Besides providing an arsenal for Protestant apologists the *Centuries* stimulated and influenced historical writing among Protestants throughout Europe and evoked counterinterpretations from Catholics, such as Baronius. They remained the standard model for Protestant historiography down to the eighteenth century.

MAGIC. The basic ideas that have everywhere underlain magic have been limited. The practise of setting a pattern for the desired event, most frequently by use of analogy, has been omnipresent. A man desires his child to grow, therefore he chews the sprouts of the salmon berry and spits it over the child's body that it may grow as rapidly as the salmon berry. He smears the dust of mussel shells on the child's temples that it may endure as long as mussel shells. A man ties the dried navel string of his baby boy and a woman that of her baby girl to their wrists while they are busy at highly trained occupations, so that the child will have the same proficiency in these techniques. Fish hawk eyes are rubbed over a sleeping baby's lids to give him the fish hawk's sight; and because the raven is supposed never to be sick, the raven's beak is laid by the child that it too may be free of illness. One desires the death of his enemy, therefore he stuffs a bit of the enemy's clothing down a dead snake's throat and ties it with the sinews of a corpse; he puts it in an exposed tree top and the venom of the snake and the contact with the corpse will bring about the death of the enemy.

Any analogy may be used to perform magic. Sometimes, as in Oceania, punning analogies may be employed. Often the analogies are so deeply felt and fundamental in the cultural outlook of the people that they correspond to philosophic conceptions, as in the cases where magic in agricultural practises is based on the analogy between human and plant fertility and sex is

conceived to be the mystic correlate of other natural processes. The techniques may be divided into large general categories, such as Frazer's classification under the headings of sympathetic (or homeopathic, or imitative) magic and contiguous magic. They all fall into the category commonly designated as false analogies; these have been the chief reliance of all magic.

The analogies may be carried out either verbally or by imitative actions and are often carried out by both. For instance, the Chukchi of Siberia to keep a dying person alive symbolically transform a little finger into the dying man and hold it tightly in the palm. They also use traditional forms of words to express the analogies of magic; a jealous woman describes her husband as a hungry bear and her rival as the carrion he happens upon and vomits with disgust. Against evil spirits they use a simile of an impregnable ball, and they likewise exploit many other comforting figures of speech. Innumerable rites and ceremonies in all parts of the world have been built up on similar pattern setting analogies.

Magic control may also be exerted by making oneself master of some secret source of power. Egyptian name magic was of this sort; when the magician had obtained the name his control was automatic. A similar idea in primitive magic is found among the Orokaiva of New Guinea, where magic, depended upon in every situation, is strictly owned. The acts and the formulae are common knowledge, but the knowledge of the specific that gives one the power to operate magically is closely guarded. The specifics are usually leaves: a leaf that wilts immediately upon plucking to quiet the waves of a storm at sea; a leaf that grows to tremendous size to put in the water in which newborn domestic pigs are bathed; and others, with no known interpretation by analogy, which are wrapped with a bit of hair from one's enemy or buried with the yams at planting. On islands off the New Guinea mainland, as in Dobu and the Trobriands, it is the form of words constituting the spell that is the secret and guarded source of power. Amulets also usually have traditionally accepted powers, which often do not depend upon conscious analogies.

Magic procedures may be heightened in some areas by concentration, or concentration may be used alone as magic without other techniques. The person who practises the magic orders the event in his mind, with the belief that it will

stage itself in reality in a like manner; the Indians of the north Pacific coast believe, for example, that by concentration they will be enabled to see quantities of dentalia and will thus come into possession of large numbers of these coveted objects.

Magic is essentially mechanistic; it is a manipulation of the external world by techniques and formulae that operate automatically. Frazer names it therefore the science of primitive man. Both magic and science are technologies, capable of being summed up in formulae and rules of procedure. Magic is believed to be, as science is, effective in its own right, in so far as its formulae are letter perfect and its routines have been complied with to the last detail; it conceives the external world to be passive and amenable to human ends as soon as the relevant techniques have been mastered. Yet not magic but the routine procedures of felling trees, knotting fish nets, tempering clay for pottery, are primitive man's literal equivalents for the knowledge classified in modern times as science. For although both magic and science are bodies of techniques, they are techniques directed to the manipulation of two incompatible worlds. Science—and in primitive life the corresponding factual knowledge and command of procedure—is directed toward the manipulation of natural phenomena operating according to cause and effect. Magic is directed toward another world operated according to another set of sequences, toward the world of the supernatural.

It is this aspect of magic which Marett has stressed. From the point of view of the forces it makes use of, the magico-religious world is a fundamental entity whose business is with power, with supercausation not with natural sequences. Marett characterizes magic as religion's disreputable sister, a value judgment that has no more validity than Frazer's opposite one of the self-respecting magician as a master of his technique and of the world, over against the cringing supplicant that religion substituted. The problem is not that of judging between the two modes of approach to the supernatural but of the recognition of the fact that magic and religion, in both Marett's and Frazer's terminology, represent two possible extremes in every type of behavior that deals with the supernatural. Magic is technological and mechanistic, a compulsion of a passive universe to one's own ends; religion is animistic behavior and employs toward a personalized universe all the kinds of behavior that hold good in human relations. In

the behavior that centers around an object regarded as powerful there may be at the one extreme the magical amulet that functions automatically, that brings fortune by its mere possession and requires no honor nor humbling of one's self before it. At the opposite extreme there may be the powerful object of the type of the African fetish, which is treated essentially as if it were human; it is talked to, given presents, laid aside to recuperate when it is tired, and the crux of its use is the rapport between the operator and the sacred bundle. In techniques of inducing power by the spoken word there are likewise, on the one hand, the formulae and abracadabra that achieve their end automatically and, on the other, the prayers of the saint who puts himself into intimate relationship with his god. In witchcraft the jinn controlled may come automatically at the rubbing of Aladdin's lamp, or a sorcerer may maintain relationship with the devil that serves because of offerings, intercourse and prostration. Functionally therefore magic cannot be discussed without its complement, religion; they are always alternative techniques for inducing power and for achieving luck by means other than those of the natural cause and effect sequences. A people may have little magic and yet its conduct may be saturated with animistic techniques by which the same sort of supernatural sanction is achieved that in another region is achieved by magical practices. Both the animistic and magical techniques, however, have in common the fact that they rely upon wish fulfilments rather than upon mundane labor in order to attain their ends.

The mental confusion which gives rise to magic is different from that in which animistic beliefs have flourished. The latter result from a lack of distinction between the animate and the inanimate world and a consequent carrying over of human relations into man's dealings with the non-human. Magic, on the other hand, in all its branches is the consequence of a blindness to the essential disparateness of techniques that can be used in dealing with the various aspects of the natural world. It teaches, for example, that a treatment of the sword which has caused the wound will cure the wound, or that milk can be made to sour properly by treating the sacred cowbell. The fallacy involved is the ignoring of the fact that every end in nature has its own techniques by which it can be achieved and the assumption of a mystic sympathy in the external universe by which techniques applied at one point are efficacious at another point.

Progress in control of the universe has always been furthered by giving up pantheistic procedures and limiting techniques strictly to specific ends.

The confusion of thought involved in magic has been emphasized by Lévy-Bruhl as the essential fact in the working of the primitive mind, which he has designated as prelogical in contrast with the reasoning processes of modern man. He concludes from primitive practises in regard to birth and death, omens, dreams, divination, tabu, warfare and curing that primitives do not make logical distinctions. More categorically he contends that in totemism the primitive man does not know himself from the eponymous animal and in relation to the dead he does not know the ghost from the living. It can, however, be shown from the testimony of the most primitive magicians that they are quite able to make these distinctions. They are merely acting upon a basic philosophical creed which, if it were explicitly phrased, would be similar to that of the mediaeval doctrine of the macrocosm and the microcosm which assumes the existence of a mystic sympathy pervading the universe, thus making facts observable or brought to pass in one field significant and operative also in another.

Magical ideas and procedures are plentiful in contemporary civilization. The secularization of modern life has proceeded at the expense of religion and its gods rather than at the expense of magic. Animism and the personalization of the external universe have been banned from sophisticated thinking and children are now induced to outgrow their tendencies in this direction as soon as possible. Comparable advance toward non-supernatural behavior has not been made, however, in the realm of magical procedures. Those who have shaken themselves loose from the trammels of religious tradition often swell the ranks of the various divinatory cults based on the fundamental assumptions of magic—a clientele of Wall Street investors depends upon the verdict of astrologers, and air pilots skilled in the latest triumphs of mechanical science guide their acts by signs. There are innumerable more subtle beliefs in modern civilization that are essentially magical; those that are partially discarded are easier to isolate than those that are still accepted. The traditional American scheme of education is distinctly magical; it does not attempt to draw up a program of what the child will need as an adult and direct its attention to the specific necessary techniques.

Its method can be justified only by faith in a magical oneness in the intellectual world; education is regarded as power in the non-naturalistic sense. Modern society is still operating magically with most of the difficult problems that have to do with sex; that is, it does not recognize that there are adjustments and desirable ends in the field of sex which should be achieved apart from all dogmas of revealed religion or traditional morality. Few countries have as yet effectively acted upon the belief that good results in the control of industrial problems or international trade follow only from intelligent and specific procedures accurately adjusted to specific problems. The most characteristic magic of present western civilization is that which centers around property; the violent sense of loss that is experienced by the typical modern in the loss of a sum of money, quite irrespective of whether he and his family will be housed and clothed and fed, is as much a case of magical identification of the ego with externals as any of Lévy-Bruhl's examples of prelogical mentality.

Magic, being essentially only a supernaturalistic rule of thumb procedure, may be either traditionally developed or almost neglected in any field of culture. The contrast between American Indian cultures and those of western Melanesia in this respect is very great. The magic practises of the Kwakiutl are on a level with modern superstitions; they give good luck and are not neglected, but they exist quite apart from the main concerns of the culture. A chief seeking to consolidate his prestige engages in many pertinent activities; he may incidentally employ the services of a proprietor of magic techniques, but his activities are not directed to any great extent by the magic that may be used, nor is it essential that he employ magic at all. The religious practitioner, the shaman, operates not by virtue of magic techniques but because of his rapport with a guardian spirit to which he has not only a personal right through a validating experience but also an inherited right as a member of his family group.

On the other hand, on the island of Dobu, as Fortune has shown, magic practises cover every phase of life and are considered indispensable. There routine procedures are believed to be inadequate in all human activities, and the acquisition of magic is therefore the foremost concern of every ambitious man. It is categorically denied that gardens, the source of the food supply, can grow without magic, despite the fact that the gardens of white settlers have grown

for two generations. The great care given to the gardens is a magical routine to keep a man's yams in his own garden and to lure away as many of his neighbor's yams as his magic can accomplish. Every man's gains are regarded as another man's losses, and magic is the chief reliance in every individual's endeavor to succeed at the cost of his neighbor. A man's harvest from his garden is therefore evidence of his magical prowess and as such is suspect. Harvest is the occasion of most carefully preserved privacy; no one outside the immediate family is allowed to see a family's magically acquired gains. Sex intercourse is likewise regarded as the result of successful magic that gives one power over another man's woman, a conception which is widespread. The asocial nature of Dobuan magic is strikingly illustrated in the use of disease bearing spells in the validation of the ownership of betel nut, coconut palm and other trees. Magic is used also for rain making, for success in economic exchange on the *kula* and in legal actions of all kinds and for causing illness and death to one's opponents. Only in reference to pregnancy do the Dobuans recognize naturalistic causation; they understand it to come about naturally as a result of impregnation. The neighboring Trobrianders have prevented such an anomaly in the general theory of magic; they deny biological paternity and foster a belief which would have brought about a complete consistency in magical world outlook were it found in Dobu. Magic therefore according to the constellation of beliefs into which it enters may be, as in Dobu, a primary concern in social situations and the indispensable guaranty of success or it may be an unimportant adjunct to achievement.

It is not helpful to make clean cut classifications of black and white magic except in cases where the local culture has elaborated a dualism on this basis. The dualism is always possible and has sometimes been made among primitive peoples, but usually magic is not definitely committed either to good or to bad but is used for either as occasion arises. There is no way, for example, to distinguish good magic from the black art in Dobu, where the use of magic for gardens is regarded as achieving yams as spoils and the cures for disease carry with them inalienably the spells that cause it.

The province of magic cannot be regarded as limited to any one field of human behavior. In support of the hypothesis that magic practise is confined to dangerous activities not amenable to matter of fact control Malinowski instances the

Melanesians' application of magic to seafaring in canoes, to weather techniques and to pregnancy control. Many other examples could be given of the use of magic in times of peril. On the other hand, a list of occasions in which magic is used without danger being present could also be compiled. One of the characteristic magic practises of Hawaii, for example, was the supernatural consecration of the home, a rite in which the birth of a child was taken as an analogy, a bit of thatch being left free to be cut as the navel cord at the ritual housewarming. The magical procedure in the Toda dairy does not mean that the preparation of sour milk products is more precarious there than it is in other cattle regions where dairying is quite matter of fact, as among the Yakut. Similarly, if danger were the soil of magic one would expect a correlation of magical agricultural procedures with environments difficult for or unsuited to the growing of plants; on the contrary, however, such magic is most luxuriantly developed in the tropical island region of the Papuans, and agriculture was probably never carried on under less hazardous conditions. The contention of Hubert and Mauss that magic is the proscribed use of supernatural power, the illicit over against the accepted, is also an interpretation based on very local conditions and is inadequate in the light of what is at present known of the nature of magic in many primitive regions. On the contrary, it has become evident that the province of magic in human societies is as wide as human desires.

Magic has often been interpreted as a salutary influence in human development. Malinowski has held that magic serves as a remedy for specific maladjustments and mental conflicts in that it "prescribes the adequate idea, standardizes the valuable emotional tone and establishes a line of conduct which carries man over the dangerous moment . . . it supplies most of the co-ordinating and driving forces of labour, it develops the qualities of forethought, of order, of steadiness and punctuality, which are essential to all successful enterprise." Recently Kempf has still further elaborated the argument by holding that magic beliefs "are psycho-therapeutic efforts to make easier the stresses of physiological functioning in a social environment" and that "man grew his cultural ways and beliefs [in magic] in order to control these [physiological] functions, just as the pains of hunger pressed him to hoard food." Any group may use magic, as it may use any sanction, to build up socially desirable activities; and the people

Malinowski is describing, the Trobriands, with their pregnancy magic and their magical treatment of economic exchange in courtship terms, have done so in a decided manner. But a wider survey of the subject merely emphasizes the fact that in such a culture as that of the Trobriands social drives in the use of magic have become stronger than asocial ones. The fact that some societies have used magic for beneficent social purposes must be regarded not as revealing the primary role of magic but as an example of the way in which these societies have been able to direct cultural traits to their special purposes.

Magic has also been held to be a valuable human support as an effective emotional release; it is argued that it has prevented dangerous repressions and made for the health of the social body. This emotional release is evident, for example, in the Chukchi formulae and in the Dobuan realistic imitations of death which accompany the use of a disease charm. No actual killing of the enemy could be so satisfactory in details of vindictiveness as the pre-enactment that is staged in the interests of magic by the Algonquian medicine man. These emotionally satisfying compensations are, however, less common over the world than one would suppose *a priori*. The techniques of magic are more devious. The emotional satisfaction is by no means direct and vehement; it seems most often swamped in a meticulous observance of petty rules. For the most part, directly because of its character as a mechanical control, magic is cold, technical and non-emotional, a rule of thumb procedure, and it is difficult to regard it as a satisfactory compensatory emotional release.

Freud has emphasized the parallel between the mechanisms of magic and those of obsessional neuroses; both are explained in terms of system formations by which fundamental displacements are achieved that supersede reality for the persons concerned and involve "motor hallucinations" and even "a fundamental renunciation of the satisfaction of inherent instincts." The role of wish fulfilment must be freely admitted; it is a factor not only in the development of magic but in all cultural traits. The world man actually lives in—in the sense of his inescapable necessities and the inevitable conditions of life—always bulks very small in relation to the world he makes for himself. Magic is used to build up these worlds and to give security within them. Nevertheless, magic is only, in Tylor's terms, an occult science and a strong development of occultism may indicate extreme inse-

curity as often as it indicates security. The yam magic does not give agricultural security in Dobu; on the contrary, it emphasizes a danger spot in the culture and far from minimizing this stress in a community in which food is scarce it institutionalizes it. Security in agriculture seems to prevail under such conditions as exist in the Trobriands, where magic has fastened itself upon other objectives of life and where agriculture is a naturalistic occupation in comparison with its practise in Dobu. Magic potency ascribed to menstruating women or to the dead has not generally inculcated social security in relation to these portents; it has rather indicated the situations which a culture regards as social hazards. The analogy with neurotic behavior is striking; whether or not a culture has chosen to regard women or persons recently dead as supernaturally dangerous, the usual course has been to erect in a neurotic manner an associated edifice of ceremonial by means of which displacement is achieved and the object of dread pushed off the scene or brought back in some more acceptable guise.

The role of magic in institutionalizing fear reactions is especially marked in witchcraft. This is clearest in situations where sorcery as a body of known and recognized magical procedures does not exist but is nevertheless an inescapable fear and a common accusation. The Salem witch trials were evidently of this type, as were the contemporary English anti-witch demonstrations. Primitive cultures, such as that of the Pueblo Indians of the southwestern United States, use witchcraft in analogous ways; the fear of sorcery is a motivation in every situation in life, but no spells or rites actually practised by intending sorcerers have been uncovered, and it seems probable that they do not exist. Even in regions where magic as an objectification of panic is balanced by its use as a control over the external world, the social control it exercises is characteristically through the institutionalizing of a fear neurosis. In Australia, for example, there are traditional techniques associated with the art of "pointing the bone," but its social significance is not so much in the fact that a few old men make use of the practise to inflict punishment as in the fact that it is the social setting for the neurosis of a conviction of death that can rarely be dislodged; entire villages have died in the strength of this conviction.

Thus the contention that magic has had a salutary role in human history must be balanced by facts which present it in a different light.

Far from being an asset it has often been a heavy liability, and its phenomena are analogous to the delusions of grandeur and fear constructs of the neurotic. Its procedures are in psychiatric terminology mechanisms of displacement, and they tend in both primitive and modern societies to substitute unreal achievement for real.

MAGNA CARTA, perhaps the most famous and influential public document in the history of English speaking peoples, had an origin which little indicated its future. King John (1199-1216) had made his rule infamous long before there was thought of forcing him to make a formal grant of liberties. He had broken every obligation which bound an overlord to his vassals in the political feudalism of that time, especially oppressive being his irregular and excessive levies of scutage and aids and his abuse of the feudal incidents of relief, wardship and marriage. His quarrel with the pope over the appointment of the archbishop of Canterbury led to wholesale reprisals against the church in England and alienated that body. The murder of his nephew Arthur, the circumstances of his divorce and second marriage, his treatment of hostages, use of mercenaries and grasping interference with trade made all classes his enemies. It surprises one that this was borne for some fourteen years, but both a leader and an idea had been lacking. The leader appeared in the new archbishop Stephen Langton and the idea through Langton's discovery of Henry I's coronation charter (1100), apparently long forgotten. It seemed apt for the purpose, for it had promised correction of William II's abuses—much like some of John's.

In the period following the Conquest circumstances had led the Norman kings and then Henry II to make more or less formal oral or written promises. Although they were strong kings, it was becoming customary for them to bind themselves to observe sundry parts of the unwritten law. Henry I's charter was the most notable instance; and this was the tradition which Stephen Langton revived. The coalition which forced the charter from John was broader than the feudal groups which had faced earlier kings, since now both the church and London were concerned; and the king could not depend on the middle and lower classes as had his predecessors. All elements feared or hated him more than they did one another. To that extent there was a national rising. The church was in fact first spoken of as the "English church" in John's reign; it was twice so called in the charter,

and it is natural to see in this some reflection of its independent attitude toward the pope and identification with English interests. Moreover the baronage was assuming to speak for the nation; their counsel was the "common counsel of the realm," a phrase used then with rapidly increasing frequency. Through long periods of peace and under masterful sovereigns the nobles had become more landlords than warriors and by both royal command and natural association were being drawn into all sorts of public service. Thus in the army which met John at Runnymede there was a great deal of the feudal uprising to vindicate feudal custom, something of a crusading spirit (their leader was called "marshal of the army of God and of holy church") to guard spiritual rights and some notion of upholding in the "community of the realm" such other liberties as had attained recognized expression.

In the spring of 1215 there had been much experimenting in drawing up lists of liberties and finally on June 15 the triumphant barons presented and John was forced to concede a schedule of forty-eight articles together with a "form of security." In the following days amendments were made and wording was worked out, and on June 19 the scribes completed engrossing the many "originals" distributed throughout England to places of safe deposit. Four of these are still extant, three perfectly legible. Two are in the British Museum and there is one in each of the cathedrals, Lincoln and Salisbury.

The earlier provisions of the Great Charter relate largely to feudal abuses, and the arrangement seems suggested by Henry's charter; but there had been a vast governmental development in the interval and many new circumstances which perforce differentiated John's breaches of law and custom from those of William II and made his charter a new and original document. Moreover it was forced from him, not voluntarily granted—one reason why it was more carefully worded and much longer. The barons did not take this occasion to annul the institutional advances of previous kings, especially Henry II. With but one or two exceptions, where they felt their financial interests invaded, they sought not to destroy but to restore and as far as possible to control. They wished to keep the king from transforming feudal payments into taxes; they laid down the principle that he could not attack freemen or seize their property except on the basis of a court judgment and in the light of a half century of experience regulated the opera-

tion of some of Henry II's legal innovations; they limited the powers of sheriffs and coroners; they decreed the ancient liberties to London and other municipalities, renewing the Assize of Weights and Measures and sundry rules touching merchants; they regulated and limited royal amercements, mitigated the forest laws and included emergency measures made necessary by the acts of an incorrigible king. At the end they outlined a clumsy, aristocratic machinery for dealing with John if he should break the charter and as a measure of last resort authorized all in the realm to rise against the king "until redress has been obtained." All this was put in the mouth of the king, and the granting words appear to have been borrowed from land grant charters. There was little thought of the distant future; just enough law was stated to meet the present emergency, the charter being essentially a treaty: the king on his side to keep these promises and barons, clergy and people to continue to regard him as king. The barons and others having a direct hand in the matter acted selfishly, to be sure, but it was high grade, discriminating, constructive selfishness. They made a great document, one that had in it the seeds of a growing greatness.

The treaty did not hold, for John did not intend to keep it. In three months he had obtained a papal release from his oath, it being impossible for Innocent III, who had become John's feudal overlord, to understand the special circumstances which united clergy and nobles in England. The country was plunged into civil war; the council of twenty-five barons to enforce the charter had no chance to function, and John died while the fight was still even. To gain the throne for the boy king Henry III the charter was voluntarily reissued in 1216, the papal legate with the new pope's consent acting with the group of conservative barons who favored John's heir. But sundry provisions were omitted or suspended, and in 1217 a more permanent text was issued with the forest articles in a separate charter. The parent document was soon called the Great Charter in contrast to the smaller forest charter; but ere long it was thought of as great in import rather than in size. It had got by chance a fortunate name. In 1225 there was a third reissue, and from then the texts remained unchanged. These texts were the ones administered in the courts and embodied in the Statute Rolls. The nature of Henry III's rule and sundry episodes in later reigns led to many solemn reissues. Indeed in the fourteenth century it became a

habit for Parliament to demand confirmations. There were pomp and ceremonial, the church pronouncing the greater excommunication upon infringers and the principle appearing that acts contravening the charters were void. Magna Carta had entered on a career of glory and contributed to the dogma of the inviolability of law—law which even kings must keep. Some articles were in wording notably expansible and adaptable and in an uncritical age served well the changing times and problems. It proved a practical document routinely administered in the courts through the thirteenth and fourteenth centuries. Occasionally groups of added articles were issued when it was confirmed, and with it were tenuously associated certain statutes which dealt with the more general principles of public law. After a period of comparative eclipse under Yorkists and Tudors it entered powerfully into the seventeenth century struggle against the Stuart kings and was construed to furnish authority for principles finally embodied in the Bill of Rights. At the same time in the American colonies it was influencing the "fundamentals," "bodies of liberties" and charters which determined the trend of the new governments and was becoming a generic term for documents fundamental to or protective of liberties. It was much cited at the time of the revolution and in connection with the constitution and its adoption. Today we study its history; yesterday it was our political Bible. If it became something of a myth, few would question that the myth has been beneficent—and still is.

MAHAFFY, SIR JOHN PENTLAND (1839–1919), Irish historian. Mahaffy was from 1864 fellow, from 1869 professor of ancient history and from 1914 provost of Trinity College, Dublin. His earliest writings were devoted to philosophy, his latest to the antiquities of his college, his central and major works to the interpretation of Greek history. Interpretation was to him the main thing. For the laborious collection and establishing of facts he had or seemed to have

little patience. Hence his contributions to knowledge were usually presented as impressions or intuitions—matters to be illustrated by examples, in the choice of which he was singularly felicitous, and by analogies, often far fetched. He was apt to be most dogmatic when he was least orthodox; and he was not held back by nice calculations of scholarly self-interest from challenging accepted opinions. He found the Athenians of the great age shockingly cruel and deficient in refinement; he dared to prefer Euripides to Sophocles as a dramatist; he stressed the historical significance of the Hellenistic age. His most valuable productions, his studies in Greek social and intellectual history and his histories of Macedonian Egypt, were for a long time the only works of their kind in English. His treatment was discursive. He had a keen eye for the picturesque and piquant. His criterion of relevance was modern interest. Hence persons, situations and incidents were strongly featured, while the silently moving forces which condition vast social changes were unduly neglected. Mahaffy was a pioneer in his revolt against dry antiquarianism and his rejection of the narrow limits set to Greek experience by ancient and modern classicism. He was among the first British scholars to interest himself in papyrology, but "he was not cut out by nature to be an editor of papyri" and was speedily outstripped by others. Like all pioneer work his is enduring only as such. He was greater as a teacher and personality than as a scientific scholar.

MAHAN, ALFRED THAYER (1840–1914), American historian. The son of a professor in the United States Military Academy at West Point, Mahan was an officer in the United States navy from 1856 to 1896 and wrote his major

books while in active service. He wrote brilliantly on technical naval history, constantly drawing political conclusions from his studies. Late in life he supported his arguments for a big American navy with a philosophy of war not dissimilar to that of Bernhardt in Germany. He was a devout Episcopalian and an active leader in foreign missionary endeavor.

His monumental work, *The Influence of Sea Power upon History, 1660-1783* (Boston 1890), and his other writings were the first to go beyond the traditional descriptions of individual naval campaigns or battles interesting only to naval specialists and to examine the political importance of naval strategy and sea power in a manner suitable for lay readers. Although great naval battles had always aroused popular attention, the importance of the slow, cumulative effects of the distant blockade had generally been overlooked by all but actual sufferers from it. As a consequence military invasions and occupations, whose incidents could be observed at close range by many persons, were given undue recognition. Mahan was the first to explain for the lay public the genius of Nelson and other naval commanders who successfully used the strategy of the blockade. In his *The Influence of Sea Power on the French Revolution and Empire, 1793-1812* (2 vols., Boston 1892) he showed how British control of trade routes and British sea power in general frustrated Napoleon's overwhelming strength on land and smashed his plan of an eastern campaign and how all the resounding victories of the French on the European mainland were nullified by the cutting off of sea borne supplies and by the stoppage of ocean commerce.

Mahan's writings were read by statesmen and publicists in all countries and were responsible for a revision of the notions of the governing and politically minded classes on naval questions. They were influential in France and England and helped win public support in Germany for the kaiser's fight for naval appropriations against the opposition of the military party. It is doubtful if the World War would have found America with the third most important fleet in the world had Mahan never set forth his lessons in naval strategy, which also influenced the American demand for naval parity with the British Empire after the war. Although some recent writers in the same field argue that Mahan overrated the value of sea power, his estimate did serve to correct earlier misconceptions; and as an important basis for the ideology of naval

expansion his work has been of great significance for recent world politics.

MAHMUD II, SULTAN (1784-1839), Turkish statesman. Mahmud came to the throne in 1808 and soon afterward began his program of consolidating the empire and of introducing reforms along western lines. His plans were, however, consistently hindered by the intrigues of the European powers, particularly Russia, by the attempts of Ali Pasha of Janina and Mehemet Ali to carve out independent principalities, by war and by the frequent rebellions of subject peoples.

Convinced of the need of westernizing Turkey, he attempted to wipe out existing abuses and to develop western institutions and customs. Although his measures enjoyed only mediocre success, they prepared the ground and pointed the way for the fundamental reorganization of the country. In Anatolia he deposed the *Dere-beys*, the hereditary local chiefs; in Mesopotamia he reestablished national authority and in Arabia checked the growing power of the Wahhabites. In various ways he succeeded in curbing feudal tendencies.

A new army after the western model was formed and was intended to include the Janizaries, who instigated a serious rebellion as a protest; the annihilation of the Janizaries in 1826, one of Mahmud's chief political achievements, created a sensation and was enthusiastically praised as an "auspicious event" by the reform party. Prussian military instructors were employed and young officers were sent to western European military schools. Nevertheless, the complete transformation of the army was too great a feat to be accomplished in Mahmud's lifetime and for the moment the results were injurious.

Under Mahmud attempts were also made at administrative reform. The central government was rendered simpler and more efficient; a ministerial cabinet similar in type to the European was formed and relations with foreign powers were strengthened by means of perma-

nent embassies. European civilization was zealously cultivated: Mahmud maintained an informal court in Istanbul, introduced European customs and fashions and broke precedent by traveling in the provinces of his empire. He sponsored the publication of two official newspapers; the French *Moniteur ottoman* established in 1831 and the Turkish *Takvimi-vekayih* (Calendar of events) in 1832. Mahmud's subjects were generally unenthusiastic about his innovations; the increased tariff, the monopolization of the sale of coffee and finally Mahmud's monopoly of Asiatic goods caused risings which were put down with bloodshed.

MAIMONIDES, MOSES (in Hebrew Mose ben Maimon) (1135-1204), mediaeval Jewish scholar and philosopher. Maimonides, the most outstanding Jewish thinker of the Middle Ages, was born in Cordova, Spain. When this city was conquered by the Almohades in 1148, his family was forced by religious persecution to emigrate; and after long and difficult years of wandering the future philosopher found a new homeland in Fostat, Egypt, where he developed an extensive practise as a physician. In his later years he served as religious head of the Egyptian Jews.

Maimonides had at his command the entire range of mediaeval knowledge and was productively active in a number of fields. Of his medical writings those known as the Aphorisms of Moses and the Treatise on Poisons (translated into French by M. Rabbinowicz as *Traité des poisons*, Paris 1865; and into German by M. Steinschneider, Berlin 1873) and a work on hygiene composed for a son of Saladin enjoyed great prestige in the Middle Ages. But far overshadowing his medical work are his Talmudic and philosophical accomplishments. His works on the Talmud introduced into that field the systematic methods of the science of his day. This systematic tendency may be observed even in his early commentary on the Mishna (written in Arabic, finished in 1168), where he deduces the principles on which the precepts of the Mishna are based. The same trend is present to

a much greater degree in his *Mishneh torah* (Recapitulation of the law), also known as *Yad ha-chazakah*. This treatise, written in Hebrew and completed in 1180, is a codification of the entire Jewish religious law, including the juristic, ritual and ceremonial phases, prefaced with a short exposition of the religious and ethical foundations of Judaism. It brings together with exhaustive scholarship all the material scattered in the tortuous discussions of the Talmud and arranges it with the most admirable clarity and comprehension; even today it constitutes the most helpful guide for the study of the Jewish religious law. Materially Maimonides' decisions on Talmudic problems attained the force of authority, particularly in Spain and the Orient; formally his compilation became the guide and starting point for all later codifications.

His chief philosophical work, the *Dalalat al-chairin* (Guide for the perplexed; in Hebrew *More nebuchim*), completed about 1190 (Arabic with French translation published by S. Munk, 3 vols., Paris 1856-66; English translation by M. Friedländer, 3 vols., London 1889), seeks to reconcile Judaism with philosophical truth (identical for Maimonides with the doctrine of Aristotle in the neo-Platonic conception of his Islamic commentators) or rather to demonstrate that they are in essence one. Biblical revelation includes all philosophical truth within itself, and therefore to possess true religion one must comprehend it in its deeper philosophical substance. In order to bring about the synthesis of religion and philosophy it was necessary for Maimonides to remold the Aristotelian system so as to include in it the Biblical concept of a supermundane creative God. With penetrating criticism he thus refutes the Aristotelian argument for the eternity of the world and the neo-Platonic argument for an eternal emanation of the world from God, in order to win a place for the belief in creation. On the other hand, the synthesis demands a thorough rationalization of the Biblical religion. The chief moments of this rationalization are, on the one hand, the philosophical sublimation of the concept of God so as to exclude not only all real anthropomorphisms but also all positive knowledge of God's nature; and, on the other, an intellectualistic concept of the nature and vocation of man, according to which theoretical knowledge is man's ultimate goal and is the means of his coming into relationship with God, immortality being accorded only to the spirit which perfects

itself in theory. The various specific teachings of the Bible are similarly transformed philosophically. Maimonides admits, although with reservations, the "natural" explanation of prophecy developed in Islamic philosophy and puts many of the Biblical miracle narratives under the head of experiences of prophetic fantasy; he also interprets the Biblical laws of worship and ritual only as a means toward the ultimate rational purpose of revelation. For those commandments which permit of no direct rational explanation he applies the historical method of interpretation, regarding them as preventives against pagan ideas and modes of worship.

While these tendencies are to be found also in the earlier Jewish philosophy of religion, Maimonides carried them out with incomparable speculative criticism; and his work became the basis of the entire later mediaeval Jewish philosophy. For three hundred years he was the center of philosophical discussions; although many thinkers exceeded him in rationalistic radicalism, others attacked him precisely for his rationalism. His influence was not merely limited to the philosophy of the schools; his philosophical interpretation of religion became the religion of the educated classes, the basis of a religious enlightenment which penetrated all branches of Jewish literature and which maintained its force despite lively attacks on the part of the strictly orthodox in the thirteenth century and the beginning of the fourteenth. Even in the modern period Spinoza was deeply influenced by Maimonides, and thinkers like Moses Mendelssohn, Salomon Maimon and Hermann Cohen learned to philosophize from him. In the culturally isolated ghettos of eastern Europe the figure of Maimonides long stood out as that of the arch-intellectual and formed the bridge between the Jewish tradition and the secular learning of the West.

Maimonides exerted also a strong influence in Christian philosophy. The great Christian Aristotelians Albertus Magnus and Thomas Aquinas followed him in the building of a theistic Aristotelianism; mystical philosophers like Meister Eckhart and Nicolas of Cusa attached themselves to his doctrine of God; in the Renaissance Jean Bodin professed his religious rationalism and even Leibniz refers to Maimonides for the founding of his religious optimism.

MAINE, SIR HENRY JAMES SUMNER (1822-88), English legal historian and political theorist. After occupying the chair of civil law at Cambridge and attaining distinction as a scholar by his *Ancient Law* (1861) Maine served as legal member of the Viceroy's Council in India from 1862 to 1869, returning to England to teach jurisprudence at Oxford and further to explore legal history and theory in a series of books. His wide and subtle understanding of legal and institutional history was derived largely from his knowledge of India and of Roman law, both of which he regarded as indispensable to English juristic study—India as "the great repository of verifiable phenomena of ancient usage and ancient juridical thought" and Roman law as the link between ancient usage and modern legal thought. His works and point of view were enormously influential in English jurisprudence: they served to correct the rigid analytic emphasis of the Austinian school and introduced the historical and comparative methods. To Maine these methods were interwoven: the study of surviving laws and customs—especially those of the East, where, he felt, the western past still lived—could be used as an index of past historical forms. But his was not the superficial and schematic historical method concerned to establish a series of invariable stages of development. He held that there could be "no universal theory attempting to account for all social forms by supposing an evolution from within." His principal concern was with the origins of civilization; he used legal history as an instrument to this end because it furnished the most certain and most illuminating material.

Ancient Law (London 1861; new ed. with introduction by F. Pollock, London 1930; with introduction by C. K. Allen, London 1931), his greatest work, is a study of the earliest ideas of mankind as reflected in ancient law and as related to modern thought. Maine regarded Roman law as a body of tough and technical wisdom worked out by the great Roman jurists, out of which have come such essential modern legal concepts as contract and the will and of which the so-called natural rights of the modern world are

but vague restatements. In analyzing the conditions out of which Roman law arose and the course of its development Maine sought to discover how the crust of custom came to be broken and the combination of order and liberty favorable to civilization secured. Out of this study emerged three generalizations: that in the development of law the sequence is that of judgments, custom and statutes; that the agents of legal change are fictions, equity and legislation; that progressive societies show a development from status to contract. He had a clear grasp of the nature and importance of custom in the development of law and used it to pour ridicule on the insularity and crudities of the English common law teaching. While Maine put the generalization about the progress from status to contract more subtly than would be inferred from his critics, it did suffer from his mistake of taking his own age as final. He saw civilization as mysteriously dependent on freedom of contract: actually, as Maitland and Pound have shown, civilization is more dependent on contract being limited in its scope. Maine further developed his ideas in *Village Communities* (London 1871, 7th ed. 1895), *Lectures on the Early History of Institutions* (London 1875, 4th ed. 1890) and *Dissertations on Early Law and Custom* (London 1883, new ed. 1891), all of them comparative historical studies of the origin of institutions: in the first, basing himself largely on the work of German scholarship, principally that of von Maurer, he showed the analogy between the living institutions of India and those of Anglo-Saxon England; in the last two he worked the Irish Brehon Laws and the sacred legal code of the Hindus into his thesis.

Maine's effect on political thought was chiefly indirect, through his enormous influence on jurisprudence. His juristic ideas had political implications; his historical search for the conditions that had caused the differences between stationary and progressive societies called obviously for contemporary application. In his *Popular Government* (London 1885, 5th ed. 1897) he addressed himself deliberately to this problem as it affected democratic society. He believed that a multitude of ideas on government were, like the legal theories he had attacked, "a set of deductions from the assumption of a state of nature": he aimed to refute easy optimism about the future of democracy by examining its history and actual functioning. The result is a book that may be described as a caricature of *Ancient Law*. The preconceptions underlying both books are

the same: that civilization is unusual and must be defended against revolutionary and plausible theories as to the nature of man and his rights. But while in *Ancient Law* this sense of the precariousness of civilization had led Maine to study with technical knowledge and subtle insight the emergence of modern law out of primitive custom, it distorted in the later book his historical study of democracy. The error of mistaking an investigation into origins for a valid criticism of values, which lurks in all his books, is here fatal. The selected facts are a mere decoration for the central assumption that civilization is a technical skill held in trust for the many by the few, a hardly won entity which force created, habit perpetuates and legal skill protects and elaborates.

Maine's work has had considerable importance also for anthropology. *Ancient Law* contains the germs of modern anthropological methods. Even before Morgan, Maine drew the distinction between kinship, or tribal, organization and territorial, or political, organization. He conceived the patriarchal family to be the basic unit of primitive social organization—a view combated by Morgan, Bachofen, McLennan and Lubbock.

MAISTRE, COMTE JOSEPH MARIE DE (1753-1821), political theorist and social philosopher. In his general point of view de Maistre, the most cogent political theorist writing in French against the secularistic, anti-aristocratic and antimonarchical ideas of 1789, is distinguished from the émigrés by a quality of objectivity which enabled him to see the full significance of the revolution as the dawn of a new epoch. This may be explained in part by the fact that he was Savoyard rather than French by nationality and that as member of the senate of Savoy (1774-92) and later as Sardinian ambas-

sador to St. Petersburg (1803-17) he passed the years of upheaval remote from the actual scene. It was in St. Petersburg that he wrote both his *Essai sur le principe générateur des constitutions politiques* (Paris 1814, new ed. Lyons 1924; tr. into English, Boston 1847) and the famous disquisition on ecclesiastical politics, *Du pape* (2 vols., Lyons 1819; ed. by J. d'Ottange, 1 vol., Paris 1903). The *Essai* stated in the form of general principles and with greater incisiveness the basic ideas previously expressed in his *Considérations sur la France* (Neuchâtel 1796; new ed. by E. Vitte, Lyons 1924), in which he had fully expounded the Catholic traditionalistic position. His posthumously published *Les soirées de Saint-Petersbourg* (2 vols., Paris 1821; ed. by A. de La Valette-Montbrun, 1924) with its celebrated apologia for the executioner "as the corner stone of human society" presented a mystical philosophy of history but added nothing essentially new.

The keynote of de Maistre's argument was that political and social institutions, being logically and actually anterior to the individual, are not required to justify their relation to the individual before the bar of human reason. The Rousseauistic contract, interpreted either as an actual historical phenomenon or as merely a legal basis for society, was absurd precisely because the individual was inconceivable except within the framework of the social order. The existence of the social order itself must be explained as the result of a superindividual, that is, divine, decree; for even the man of genius, like the great lawgiver of antiquity, was endowed with real creative power only to the extent that he felt himself to be the instrument of a transcendent force. If man would avoid the error of the "trowel which mistook itself for the architect," he must recognize that the function of a constitution was confined to the formulation of relationships, the legality of which rested upon a preexistent sanction. The sole criteria admitted by de Maistre for evaluating a particular social or political institution were the length of time which it had endured and the will of providence. On some occasions he equated the two criteria and on others he assigned precedence to time, "the prime minister of God on earth." But in either case he completely excluded the welfare of the individual, who represented in his philosophy a mere moment in the series of generations. The Catholic side of de Maistre's traditionalism appeared in full relief when he correlated the power of a constitution to endure

with the extent to which it was permeated by religious elements. After such an analysis de Maistre was logically prepared to condemn all written constitutions and in particular modern parliamentarism. Although he approved the retention of certain traditional associations, such as estates and guilds, which might act as intermediaries between ruler and ruled and even exercise rigidly circumscribed powers, he countenanced no real check upon the sovereign except the papacy, to which in the event of conflict the people might as a last resort appeal. The pope as representative of God on earth was absolute sovereign, which for de Maistre implied infallibility and complete freedom from conciliar control. Infallibility attached also to the sovereignty of the temporal ruler, but in his case it was only "presumed," while that of the pope was warranted by God.

Because of its admixture of the dogmatic with the empirical the influence of de Maistre's political theory has from the first been restricted. A doctrine which treated the Reformation as merely a different aspect of the error which produced the revolution could naturally gain no footing in Protestant countries. In the Catholic countries it found adherents only in clerical circles, so that de Maistre became immediately marked as a political partisan. It is to be noted, however, that the arabesques of Catholic dogma may be removed without impairing the force of de Maistre's argument that both morally and historically society precedes the individual. This basic positivism, however disguised, explains the influence which the Catholic traditionalist exerted upon Comte through the socialist Saint-Simon and through Comte upon the sociologist Durkheim and the neoroyalists of the Action Française.

MAITLAND, FREDERIC WILLIAM (1850-1906), English legal historian and jurist. Coming at Cambridge under the inspiring influence of Henry Sidgwick, Maitland applied himself to the study of philosophy and was bracketed at the head of the moral sciences tripos of 1872. He studied for the bar and engaged in chancery practise but in 1884 returned to Cambridge to a readership in English law, and in 1888 he was elected Downing professor of the laws of England, a chair which he held until his death in 1906. It was Vinogradoff who inspired Maitland to explore the vast collection of original sources for the legal and social history of England which had been preserved chiefly at the Public Record Office. The first fruit of his lifelong research in this field was *Pleas of the Crown for the County of Gloucester* (London 1884), and his next an edition of the manuscript collection of cases which Bracton had formed and used in writing his treatise on the English laws and customs of the thirteenth century, and which Vinogradoff had discovered (*Bracton's Note Book*, 3 vols., London 1887). In his inaugural lecture in 1888, "Why the History of English Law Is Not Written" (*Collected Papers*, vol. i, p. 480-97), Maitland set forth the crucial importance of editing the mediaeval yearbooks and other law sources according to the canons of critical scholarship before the history of English law could be adequately written. As an earnest of his own efforts to this end there appeared his *Select Pleas of the Crown* (London 1888), the first of many volumes of original texts edited by him with valuable introductions for the Selden Society, which in H. A. L. Fisher's words was "the creature of Maitland's enthusiasm." Among his most important contributions to the society's publications were his editions of some of the *Year Books* of Edward II. A decade of such studies equipped Maitland remarkably for writing in conjunction with Sir Frederick Pollock the epoch making *History of English Law before the Time of Edward I* (2 vols., Cambridge, Eng. 1895; 2nd ed. 1899); in the collaboration by far the larger share of the research and writing was Maitland's. In this work Maitland synthesized the results of the detailed research carried on by himself and others. Unflagging he went on to other studies: *Domesday Book and Beyond* (Cambridge, Eng. 1897), *Roman Canon Law in the Church of England* (London 1898), *Township and Borough* (Cambridge, Eng. 1898) and *English Law and the Renaissance* (Cambridge, Eng. 1901). Aside from these books his essays and reviews (*Collected*

Papers, ed. by H. A. L. Fisher, 3 vols., Cambridge, Eng. 1911) treat with great brilliance the theory of the trust concept, the corporation (see also his introduction to his translation of a portion of Gierke's *Das deutsche Genossenschaftsrecht* as the *Political Theories of the Middle Ages*, Cambridge, Eng. 1900) and many other subjects.

Maitland was one of the most eminent figures in the intellectual life of his time. He was trained in philosophy as well as in law and history, skilled in palaeography and diplomatics and learned in all the sciences auxiliary to history. His reading knowledge of foreign languages was extensive; and in the introduction to the first volume of his series of the *Year Books* of Edward II he gave an account of the Anglo-French language in the early *Year Books* which has received warm praise from experts. He used these great gifts in the study of original materials for the illumination of the institutional and legal history of England. One of the marked features of his peculiar genius lay in the discovery of the truth of history hidden away in a mass of cold and crabbed documents. His aim was always to present a living picture of the men and institutions of the past. Only the best evidence would satisfy him; and in his hands such sources as *Domesday Book*, the *Plea Rolls* and the *Year Books* became human documents. But more important even than his capacity to vitalize the past was the fact that he wrote legal history as intellectual history. To him the history of law was primarily the history of ideas; and much of his attention was directed to a search for the origin of the ideas that are decisive in present day legal institutions. It is in this sense that he recommended that history be written backward. His preoccupation with the quest for the origin of ideas led him in his juristic thinking to a genetic and comparative method, but his mind was too fluid ever to be captured by any of the "schools." He wrote in a lucid, nervous style of his own which expressed admirably the elasticity, vividness and subtlety of his mind. Above all, his approach was broad and profound. By envisaging the history of English law as an aspect of the whole stream of English life he brought legal history into close relationship to political, constitutional, social, economic and religious history. His work revolutionized legal history and it has been the most stimulating of all the factors in the recent progress of historical studies devoted to England.

MAITLAND, JAMES. See LAUDERDALE, EIGHTH EARL OF.

MAJORITY, AGE OF. The period at which the child becomes a man is not fixed in the same way in all types of society. In primitive society the phenomenon of puberty marks the dividing line which indicates the attainment of social majority, the capacity to take part in the ceremonial and social activities of the group. The elaborate ceremonials which follow the reaching of puberty among some races emphasize the social and religious factors. The legal consequences of puberty are incidental, if indeed any differentiation of legal rules has taken place. In matured legal systems the attainment of majority, marking the commencement of full legal capacity, is wholly legal in its nature, a norm arbitrarily posited; its artificiality conceals the non-legal elements of its origin and thus also weakens its legal force.

In mature legal systems the child remains a minor until a fairly advanced age after physical maturity in order to protect him from the consequences of his presumed intellectual immaturity. The interests of society, however, require that certain legal transactions undertaken by the minor should have legal significance. Not only must society be protected against possible criminal action on his part, but the interest in the security of transactions may require that he be held liable for tortious conduct and even for certain contracts.

The variety of method in determining the age of majority has been considerable. The age of majority may be specifically fixed at a period approximating puberty, as in the early Roman law, where it was twelve for females and fourteen for males, or else a maximum limit may be set for children who do not reach puberty at the

normal age. Thus the Hanifite school of Islamic law fixed fifteen years for both sexes. Most of the Germanic laws chose the rather early age of twelve for both sexes, which later under the influence of the Roman law was sometimes increased to fifteen. Again, the test of puberty may be completely abandoned and different ages of majority may be adopted for different classes of society. This was typical of feudal Europe. The ages selected often reflected economic motives: in the English law of the eleventh and twelfth centuries a burgess' son came of age when he could count pence, measure cloth and conduct his father's business; or again military motives: a knight's son in England and most of France came of age at twenty-one; sometimes the age selected seems rather arbitrary: fifteen years for the son of one holding in socage tenure in England, fourteen years for a villein's son under many of the French *coutumes*. Finally, a system of graduated majorities or else a single age of majority may be adopted for all classes of society.

The system of graduated majorities is typified in the later Roman law. Persons under the age of seven were *infantes, qui fare non possunt*; persons between seven and twelve if females or seven and fourteen if males were *impuberes infantia majores* who required the consent of their tutor for all legal acts which involved the assumption of obligations. After Justinian persons who were no longer *impuberes* but were less than twenty-five years of age required the consent of a curator for certain legal acts, particularly for bringing suit.

Modern legal systems have tended generally to adopt a single age of majority; Germany, which follows in a modified form the Roman rules—under modern German law a minor under seven years of age has no capacity while a minor above that age has ordinarily only a restricted capacity—is the outstanding exception. In England the overshadowing importance of the land law and the operation of the tendency for the law for the higher classes to become the law for all classes of society resulted in the substitution of the age of twenty-one for all persons in place of the feudal scale of ages. Similarly twenty-one became the age of majority for all of France in 1792 (now art. 488 of the *Code civil*). The same course of development as in France preceded the adoption of the graduated scale of majorities in the German Civil Code. A law of the German Empire of 1875 fixed upon twenty-one, superseding the different ages of

majority which prevailed under its various legal systems (e.g. twenty-one in the Bavarian, twenty-four in the Prussian, twenty-five under the German common law). The Swiss Civil Code has fixed the age of majority at twenty.

The relatively advanced age of majority in most modern legal systems may be explained not only by the complex character of modern social and economic relations but by the fact that the attainment of majority normally entails full legal emancipation. It is to be noted that the modern civil law institution of curatorship for adults has not had the effect of making the age of majority earlier than in common law countries where curatorship does not exist. In the Roman law the *patria potestas* persisted during the whole life of the *paterfamilias*. In the Germanic laws the child had to leave the paternal abode and establish his own household before the mundium of the father ended. Everywhere, however, it has been found impossible to confine the rules of capacity of minors within the straight jacket of a single relatively advanced age of majority, with the result that traces of the graduated system are practically universal. In all systems some scheme of graduated ages obtains for criminal and delictual liability, and there is often a special age for capacity to make a will. The compulsion to disregard the age of majority in such cases is obvious. Social institutions peculiar to one country may also be important, as, for example, the French rule (unmodified until 1927) forbidding a person under twenty-five to marry without the consent of his parents. In England the forces of competing local borough customs continued for a long time to mar the symmetry of the common law rule. The canon law fixed the capacity of an infant to make a will at twelve for females and fourteen for males and the capacity to act as executor at seventeen. Further many systems provide the possibility of an early attainment of majority; the *venia aetatis* of the Roman law has been influential in this respect. Thus in the Netherlands, where the age of majority is twenty-one, majority may also be attained before then by marriage or by receiving "letters of majority" from the High Court at or after the age of twenty. A limited "emancipation" may also be granted at the age of eighteen.

The rules as to the capacity of minors vary even more widely than those fixing the age of majority. The fundamental divergence lies in the adoption of the Roman conception of guardianship by the civil law countries. Every minor

has a guardian—a parent or some other person—who can act for him. In the French system the identification of the civil capacity of the minor with that of the tutor is almost complete, but some acts, such as alienation or hypothecation of immovable property and acceptance or repudiation of an inheritance, may be undertaken only with the consent of the *conseil de famille*.

In the English common law the simple device of guardianship for a variety of historical reasons never received complete development, and from an early date the rules of capacity of minors became greatly complicated. The guardian could not even represent the minor in litigation. The protection which the minor could have found in a developed system of guardianship had to be sought in the crude expedient of the demurrer of the parole, whereby in order to retain the status quo undisturbed all actions by or against an infant were suspended until he should reach his majority. So extreme a principle could not long remain in its pristine rigidity. Yet although it was radically modified it was not discarded. Indeed only the adoption of a fully developed system of guardianship could have destroyed all vestiges of the demurrer of the parole. At an early date the doctrine seems to have become applicable only to rights which the infant claimed through inheritance and not to those which he claimed through his own acts. Later the infant was permitted to acquire and own property and to sue through his "next friend" for money due to himself; he could be made liable for waste, trespass or failure to pay rent. He was not permitted, however, to make an irrevocable disposition of his property. If he attempted to do so, the transaction was not void but it could be disclaimed when he came of age. In the latter part of the sixteenth century the ingenuity of lawyers almost succeeded in killing the last rule. The infant would convey his property by common recovery, appearing in court by his guardian, who would fail to plead infancy. Since the infant was supposed to have a sufficient remedy against his guardian for his failure to plead, the conveyance was allowed to stand as irrevocable. In 1614 Lord Coke ruled that this expedient could no longer be used. Consequently the conception of acts which are voidable although not void still lay ready to hand when the law of contracts was developed. In two main cases, however, the infant was held to be bound—when he made a contract for necessities and when he acquired an interest in property to which obligations attached or entered into a contract which in-

volved obligations and then took some benefit under the contract.

Thus even in private law the age of majority cannot be viewed as a hard bright line separating the exercise of legal capacity from its non-exercise. In public law its significance disappears almost entirely. The selection of the age of twenty-one as the minimum age for the exercise of the electoral franchise has apparently come about only by analogy with the age of majority, since in many countries a different age requirement for electors is in force. Everywhere graduated systems of age qualification for the holding of public office are to be found.

MAJORITY RULE. Whenever a group of persons or of organized bodies is called upon to express a joint opinion or to draw up a joint resolution, the vote of the absolute majority of units—or in a few cases, such as some elections, the vote of the relative majority—is accepted as expressing the thought or will of the entire group. This axiom of collective life, which now prevails among representative bodies, collegiate courts, assemblies and organs of corporations, in plebiscites and elections—everywhere in fact except in strictly intellectual deliberations, where the validity of the conclusion cannot be ascertained by the weight of numbers—is the product of a long evolution and complicated interaction of historical factors. As it gradually became evident at an early stage of societal development that the greater number is also the more powerful physically, the advantages of a device for submitting peacefully to this superior force became increasingly apparent in various primitive groups and ancient states. But before this empiric observation could become crystallized into a general principle it was essential that the par-

ticular community should become imbued with the consciousness of its continuous homogeneity and of the potential advantages that the adoption of the principle might confer on the various social groups which might alternately compose that majority.

In the primitive community with its undifferentiated conception of law and its tendency to homogeneous expressions of will the decisions formulated by the elders were submitted for the approval of the populace, which might acclaim or repudiate them either by shouts, as in Sparta, or by the clashing of weapons, as among the primitive Germanic tribes. The transition to a less haphazard technique of arriving at the sentiments of the majority manifested itself in a number of Greek republican states, both aristocratic and democratic, which elaborated various precise forms of voting (*q.v.*). In Rome, where the majority was determined at sight according to the formula *Haec pars major videtur*, a clear differentiation was drawn between bodies, such as the Senate and the comitia, where the decision was taken by the majority and those where one magistrate, as, for example, the tribune, could by his veto thwart the expressed will of the community. The perpetuation of the tradition of majority rule during the Middle Ages was the work almost exclusively of the Catholic church, which in its synods and canonical elections adopted the classical principle, although even the church preferred over a long period of time to place a premium on unanimity as the infallible sign of God's voice rather than to sanction the mechanical superiority of numbers. During the eleventh and twelfth centuries secular Italy exhumed the majority rule along with other Roman traditions and thereafter applied it in very subtle forms, particularly in the Venetian republic. The Teutons and Slavs, on the other hand, were obliged to learn from their own experience the advantages of the device of majority rule and took over little from classical antiquity. The Germans, rooted in a long established tradition of individualism, found it difficult to introduce the technique into the procedure of their communal assemblies and political congresses; so that it was found necessary to impose upon each of the participants in the assembly an oath that he would not interfere with the carrying out of the resolution. The early Slavs, unfamiliar with the device of majority rule, relied entirely upon unanimity, some of them going to the length of beating, expelling and even drowning the dissenting minority.

The speed with which the technique of majority decision was developed in the various countries of antiquity and modern Europe was determined largely by a number of broader social and economic factors. In general it may be said that its application was materially advanced in situations where a common external danger compelled the minority to acquiesce peaceably or where the majority felt compelled by reasons of internal tension, whether economic, religious or political, to insure the effective execution of its decisions. Where the minority was unable to emigrate, the necessity of submission became still more imperative; and where the execution of the majority's decision was entrusted to a strong executive, much of the cumbersomeness inherent in the device was eliminated. The transition to majority procedure was facilitated also by the disappearance of deep social cleavages and by the break up of privileged oligarchic groups, which had hitherto exerted a weight altogether disproportionate to their actual numbers. It should be observed moreover that in the early stages of transition the majority technique was applied almost exclusively to less crucial decisions, which could be carried into execution without arousing active opposition, and that only after it had become thus tested was it extended to such critical spheres as the conduct of war and especially taxation, which continued until a late period to arouse the opposition of privileged individuals or corporations accustomed to immunity from financial obligations. It is likewise true that it first gained vogue among deliberative bodies which were not composed of delegated representatives of a constituency and which had no political prerogatives or executive responsibilities. The clergy gave an example of orderly deliberation to the cities, the cities and the clergy to the nobility, unions of a corporative character to looser organizations. A more immediate stimulus to the spread of the majority rule principle was the separation of the process of voting from that of debate, whereby it was possible to determine the exact personnel of a particular division.

Since the time of the Greeks various observers of this historical process had attempted to formulate and clarify in more scientific terms the issues involved. To Aristotle the practise was justified in that it was intimately bound up with the concepts of liberty and equality, which presuppose even in an aristocracy the possibility of the governed displacing the governing through the medium of the vote. The ideological foundations laid by Aristotle were built upon by the

political theorists of mediaeval Europe, who in addition developed with growing intricacy the simple Roman formula: *Quod major pars curiae effecit, pro eo habetur ac si omnes egerint*. The subtlety of many of their formulations, such as *major pars, sanior pars, major et sanior pars, unitas actus* and amendment of a non-unanimous decision by accession of the minority, was simplified in the doctrine of Marsilius of Padua, who was the first to insist that the *valentior pars* constitutes the ruling power in society.

The teachings of the canonists and of the commentators on ancient law and theory were widely utilized. In England during the fifteenth century the kings taught their parliaments to defeat the will of privileged and refractory minorities; the same was simultaneously done by the French kings in their Estates General. Nations which did not adopt the majority rule principle either ceased to be self-governing or opened the way to dismemberment or stagnation. In Spain, for example, the intransigence of the members of the Cortes, who clung to their traditional right of *disentimiento*, was instrumental in fixing upon the country a regime of unrelieved absolutism; the Diet of the Holy Roman Empire, which as late as the seventeenth century still refused to recognize the will of the majority in levying taxes, gradually dwindled as a unifying force. In Switzerland the failure to introduce the majority rule principle resulted in the break up of cantons; majorities were often declared incompetent in religious matters. A chaotic, undisciplined Diet was the cause of Hungary's loss of freedom, and in Poland the same situation had even more tragic results. During the sixteenth century the constitutional principle of *communis consensus* was interpreted in that country as necessitating unanimity in legislation, levying of taxes, elections and communal self-government; only collegiate courts observed the majority rule. Any deputy to the Diet or any country squire in a communal assembly could by his veto frustrate all deliberations, unless they were held under a special "confederate tie." It was not until the eighteenth century that it was realized that the only salvation lay in the adoption of the majority rule principle, but the neighboring states upheld by armed pressure the anarchy and the veto.

In those countries, however, which in the wake of France and England gradually improved the technique of the majority rule compromise this for a time contributed to the making of a strong centralized monarchy. But the new em-

phasis given to the doctrine of majority rule by the successive philosophers of natural law prepared the way for a more thoroughgoing democratic movement, which by 1789 was sufficiently integrated and articulate to challenge successfully the basic premises of the older process. Althusius and Grotius contended that in concluding the original compact society had bound itself to submit to the will of the majority; Hobbes and Locke added that the minority must therefore submit through physical necessity. Vattel and Beccaria conceded, however, that the minority might decide to separate from the community. Rousseau in his *Contrat social* went so far as to hold that in voting the citizen must endeavor to express not his own but the collective will; only thus can he be a free man, for in opposing this collective will he is at fault and should he succeed in imposing his own will he is no longer free. The Polish writer Konarski, a contemporary of Rousseau, without postulating an original compact presents what is perhaps the most convincing demonstration of the vital necessity of government by majority, which grants a perpetual privilege to none and permits an equal share of power to all. Helvétius in his concern for the happiness of the greater number was ready to sacrifice the interests of the minority, thus preparing the way for the arithmetical utilitarianism of James Mill and Jeremy Bentham, which served as the ideological corner stone of government by parties and of electoral reform movements throughout the nineteenth century. Since the French Revolution through its Declaration of Rights proved that by invoking the principle of majority rule authority and tradition can be overthrown, all constitutional life, particularly in republics and democracies, has been based upon the majority principle. This applies also to law courts, the only exception being the English type of jury, which requires unanimous verdicts. Majority rule thus came to be not only a system prevalent in a certain country or an institution or a method of voting but, except in a few quarters (see MINORITY RIGHTS), an absolute and generally accepted concept. The idea that as a rule truth, reason and justice are on the side of the majority became the keystone of the democratic credo.

The practical application of this general rule through the medium of the ballot takes various forms and sometimes meets with technical difficulties. A distinction is usually drawn between an absolute majority ($\frac{1}{2}N + 1$) and a relative majority (for example, 5 votes against 4 and 3

in a total of 12 votes); sometimes a two-thirds or three-fourths majority is required or, very rarely, the agreement of more than half of all those entitled to vote. As a general rule the absent are not counted, while various regulations treat differently those who abstain from voting. A certain prescribed number of members present, the so-called quorum, is usually sufficient, but even a decision taken without a quorum is valid if it was not questioned before the vote.

Since the aim of majority rule is to record a constant will and not a passing impression, two or three polls, or "readings," are often required. When the question admits of more than one answer and not simply of yes or no, the proposal receiving the smallest number of votes in the first poll is eliminated, and eliminations follow until one of the two remaining proposals can gather an absolute majority—a procedure which has resulted in a tendency on the part of those without a definite opinion to vote rather irrationally for the first proposal presented. In conformity with the example set by England assemblies vote first on the amendments, then on the proposals, it being understood that the adoption of an amendment does not preclude the acceptance by the voters of the entire proposal. These subtleties have come into vogue because it has been learned from experience that many members of assemblies more readily express their negative than their positive reactions at the beginning of a deliberation.

The principle of majority rule in its modern form excludes the veto of the king or of a non-elective body, such as the upper House in England or in pre-war Austria, as it does also electoral categories or classes which confer an advantage upon the aristocracy or plutocracy. All the struggles for an equal, direct, universal and secret suffrage during the nineteenth century were intended to sanction what Herbert Spencer called the divine right of the people, i.e. the absolute domination of numbers. Despite these high hopes, however, genuine majority rule remains for a number of reasons an ideal rather than a reality.

First of all it has been found possible by skilful manipulation on the part of rulers to bring into existence a specious majority, which conforms only in appearance to the actual principles of majority rule. As early as the fifteenth century the French kings found it possible to group the representatives of the people in such a way as always to obtain a majority for their proposals, while at a subsequent stage of devel-

opment the democratic politicians of the nineteenth century invented the technique of "electoral geometry" or, as it was called in the United States, gerrymandering. By clever districting of the electoral constituencies this device secured a preponderance of seats for certain parties; each seat was obtained by a narrow majority, while other constituencies received fewer seats, although each of them was supported by a large majority of electors. Similarly the Polish electoral statute secures supplementary seats from a so-called state list, not for the party whose supporters are too dispersed to win them in a particular constituency but precisely for the party which has already obtained a considerable number of seats.

Such devices as these are inspired by the desire to avoid disturbances which would arise from an unbalancing of parties and violent shifts of opinion in the legislative body. Since the representatives of the people have almost without exception shown a tendency not only to legislate but also to rule, they have been forced under many circumstances to unite into blocs so as to obviate the necessity of guessing on the occasion of each ballot the transient desires of their constituents and of forming new groups with every change in opinion. In the representative body the majority seldom holds a ready opinion on a given problem; the groups sharing certain common interests often constitute less than half of the nation, and frequently in an apparently homogeneous group social and intellectual clash with material interests. In order to attain to power therefore those who want protective tariffs, for example, associate with partisans of bimetallism, with opponents of the separation of church and state or with supporters of prohibition and thus form during the elections and later in the legislature a majority composed of many minorities. For this purpose electoral cartels, or joint lists, are formulated whereby one party gives over to the other its surplus votes, and unions of parties appear in the elections under a common name. As a rule, however, these ad hoc majorities tend to break up and reorganize rather frequently.

The more public opinion swings to violent extremes, whether to the right or to the left, the greater is the opportunity afforded to a parliamentary group representing a minority of the total voters to anticipate the direction of the new swing. If, for example, a liberal group obtains a two-thirds majority, a radical wing representing, say, two thirds of that group is able to exercise

a virtual domination despite the fact that its members may constitute only four ninths of the total voters in the country. A reactionary minority backed by a moderately conservative majority may likewise attain power. This tendency to non-majority government is aggravated by the fact that a large percentage of electors abstain from voting, so that the result is frequently decided by sections representing less than 50 percent of the population. Thus it has become a practise in some countries, in cases where a special effort is made to verify the will of the majority, such as a popular referendum or veto on fundamental questions, to interpret abstention from voting in a popular veto as tantamount to approval and in a referendum to disapproval.

In order to prevent the distortion and misrepresentation of the collective will in the legislature electoral systems have been devised under which the deliberative body is to constitute an accurate mirror of public opinion or, in the words of Mirabeau, "a geographical map," according to its territorial distribution and with all its variations. Several types and techniques of proportional representation received theoretical support in many quarters during the nineteenth century and within recent years have been increasingly applied in practise.

The majority principle and particularly majority government in its present day political manifestations exert a profound influence on broader social and cultural life. The fight for votes obliges political parties and in many cases non-political organizations to recruit partisans by any means whatsoever, even at the expense of social stability and harmony. A net of electoral propaganda is thrown about those who do not belong to any party and even in highly civilized communities blatant slogans, seductive catchwords, backed by financial resources and a strong electoral machine—sometimes even supported by the administration—are ceaselessly employed to befuddle the calm objective judgment of the voter. In the United States, where there is no "government by majority" in the sense of government responsibility before parliament, the fight for seats has less importance than has the presidential campaign, which is conducted with an eye to the hallowed tradition of "spoils to the victor." If it is true that unreflective partisanship is a regrettable by-product of the majority rule dogma, it may by comparison with the dogma of unanimity, to which Poland, for example, in the old days was willing to sacrifice clear and honest individual judgment, be the

lesser evil. Moreover while striving to secure the government for themselves parties under a system of majority rule learn to forget the minute differences which separate them and to subordinate secondary interests by uniting into blocs, sometimes even by forming larger parties—a process which simplifies the political game while leading the individual voter to give more constructive thought to general issues.

Naturally its Parliamentary Majesty the majority is not capable of dealing with everything. It is quite unfit, for example, to pass upon the intricate details of involved legislation and on the whole merely places an *ex post facto* public approval or disapproval on measures elaborated in advance by technical experts and lawyers; a complicated law therefore is usually accepted or rejected *en bloc*. In cases involving delicate issues which might easily compromise the whole party or certain of its members in the eyes of their constituents the parliamentary majority may authorize the government to act by special decrees. For all questions in fact the effective functioning of the majority is inconceivable without a hierarchy of technical and political authorities and a corporate discipline, which at times assumes the form of an openly recognized clique or caucus and at others attempts to disguise the real domination exerted by a secret organization. In the United States exaggerated party discipline changes the House of Representatives into a voting machine; speeches on the floor are for the benefit primarily of the press and of the constituencies and have an insignificant effect on the actual legislative process, which is controlled almost entirely in advance by a small minority composed of congressional committees collaborating with the administration.

The penetration of the majority principle into spheres other than that of parliamentary politics is less deep and at any rate less violent. In regional assemblies the majority rule is less stringently applied, in the first place, because the economic problems which predominate in these assemblies are matters of immediate and general concern and therefore require a compromise and, in the second place, because the decisions of these assemblies instead of being absolute must often be submitted for revision to higher authorities. Unions of liberal professions, compulsory or not, apply the majority principle in cases where their competence is recognized by their statutes; but if membership is not compulsory, the majority must use its

power with discretion so as to guard against secession on the part of the discontented. In economic organizations it appears natural that the majority of workers or of union delegates hold negotiations with the employers or decide a strike in the name of the minority as well; but it is less consistent with the pure principle of number when a majority of skilled workers' unions excludes from the advantages of a joint organization the smaller number of unions representing the unskilled workers, who in total numbers may bulk largest in the trade. An extreme caricature of "the greatest happiness of the greatest number" is the adaptation of the majority principle to corporation finance, where a few potentates possessing the preponderance of shares exert unchecked control over hundreds of small shareholders. Generally speaking, in economic life majority rule may lead to disastrous results. The interests of the cities, for instance, are often completely sacrificed to those of the village, or agricultural interests to industrial. Small wonder then that the demand has frequently arisen in these spheres for a transference of the center of gravity of economic decisions from the legislature to other bodies representing directly social and economic groups (see FUNCTIONAL REPRESENTATION).

Educational organizations, such as school councils, assemblies of professors and the like, submit to majority decisions on problems of education or administration but not in cases where the majority wishes to express the political or moral opinions of the whole. This is true also of religious organizations and various special associations, in which the majority has a strictly limited competence. Academies and scientific associations in order to prevent accidental majorities from neglecting certain branches of work distribute the funds designed for various purposes according to a proportion established and accepted in advance and require a qualified majority for the introduction of new members.

MALABARI, BEHRAMJI MERWANJI (1853?-1912), Indian journalist and social reformer. As a young man Malabari came under the influence of some Irish Presbyterian missionaries and of Dr. John Wilson, then principal of the Scottish College in Bombay. In 1880 he purchased the *Indian Spectator*, which he edited for more than twenty years, until it was merged with the *Voice of India*. In 1901 he took up the editorship of *East and West*, in the pages of which he described many social evils with a zeal and sincerity that commanded attention throughout the country. Gifted with a crisp and trenchant style and possessing lofty ideals, he laid bare the dark spots in the Indian social organization at a time when the contact with the West had led to the disintegration of the ancient mores and new mores had not yet emerged. He denounced the merchant class in Bombay as lazy and cunning, asserting that the enterprise and honesty which had hitherto characterized all mercantile transactions had disappeared. He showed that despite modern education the people were freely taking part in obscene religious rites and festivals and were acquiescing in the debauchery of the priesthood. Such was Malabari's strong indictment of Hindu society. It was on account of his strenuous efforts in the press and on lecture tours that the Age of Consent Act was passed in 1891. Malabari in fact sowed

the seeds of social reform in western India in all directions. In his profound conviction that it is in the middle ranks of life that the materials for a "mighty, puissant nation" are to be found in India, in his exhortation to the people to learn patriotism; to set the nation above caste, creed or race; to give up child marriage; to abjure priesthood; and to create and organize a new national church founded on the simple tradition of good thought, good word and good deed, Malabari expressed the aspirations and ideals which in the last quarter of the nineteenth century were fashioning a new Hindu society in the crucible of conflict with the Occident.

MALADJUSTMENT. The concept of maladjustment enters into the social sciences in a great number of forms and disguises. In the applications or arts dependent on the social sciences, such as psychiatry, criminology and social work, it has gained particular recognition and wide vogue. Variety of interpretation and frequent vagueness and even confusion are, however, exhibited in current usage.

Two main types of maladjustment, which may be called respectively technological and psychological, are to be distinguished. In the former the maladjustment falls within a scheme of social organization. The social system is itself in some sense and degree out of joint; its parts are not properly geared together so as to permit the adequate functioning of the whole toward the desired end of its operation. Here maladjustment is interpreted purely in terms of a social mechanism. When, for instance, the economist speaks of overproduction and underconsumption, of a disproportion between producers' credit and consumers' credit, of the excessive control of finance over industry, he is imputing maladjustment in this sense. By an extension of this usage the whole economic system may be impugned as maladjusted, as in the Marxist attack on capitalism, to the underlying conditions of production. It is in the sciences dealing with the technique of social organization—economics, law and government—that the concept

of maladjustment so understood is most in evidence.

Psychological maladjustment has an entirely different reference, although the condition which it designates may be represented as a consequence of technological disequilibrium. Here the maladjustment is attributed not to the social organization as such but to the socially conditioned, limited or repressed personality. Whatever the determinant factors may be, it is the individual who is represented as maladjusted within himself or in relation to his group. By an extension of this usage the smaller group may be thought of as maladjusted within the larger group or with respect to the social conditions which the larger group sustains. In this category the criterion of maladjustment is no longer as in the former the loss of efficiency or service technically realizable but directly the failure of the individual or individuals to attain some norm of behavior. The variability of such norms and the problem of their validity render the second type of concept more precarious.

In a purely physical sense the adaptation of any object whatever, organic or inorganic, animate or inanimate, to its environment may be conceived of as inevitable, universal, complete. In a biological sense adaptation is that relation of the living thing to its environment which admits the persistence of the species to which it belongs. The transition from the biological to the psychological sense occurs when the criterion ceases to be mere persistence or survival, when it is no longer mere living but a way of living which is sufficiently in accord with the individual personality to prevent the development of acute strains and frustrations. This distinction is not clearly observed by those biologists who with ethical intent freely apply the terms natural and unnatural to the conditions and activities of human society. When the issue is one of the conformity of a mode of life to specific socially derived requirements of such a character that the failure to attain them creates an abiding personal disequilibrium, the term maladjustment is superior to the naturalistic term maladaptation. As Sumner, C. Lloyd Morgan and others have pointed out, there is attained in the higher reaches of organic life an area of biological indifference within which alternative modes of life undeterred by sheer considerations of survival are possible. Hence the psychological concept of adjustment cannot be reduced to the biological concept of adaptation.

As this area of indifference grows, as in fact society becomes more elaborate, the opportunities or occasions for maladjustment increase. In primitive life the dominance of habits dependent on the simpler arts of self-preservation and confirmed by the more uniform discipline of life in the small homogeneous group is less conducive to maladjustment in the stricter sense. The savage may be hungry or sick or afraid, but these conditions are merely the contingencies of the scheme of life to which he is adjusted. He may violate or evade the code of his group, but he rarely questions its validity nor is he perplexed within his own milieu by the conflict of codes or standards. He matures within the system of mores into which he is born. The transitions of a society as changeful as it is complex are remote from him. His typical attitude toward the system remains unified and sacrosanct whatever his behavior.

It is quite otherwise in a modern society with its mobility and instability, its impersonal and distant controls, its inconsistent and clashing codes. Technological advances disrupt old habits, scientific discoveries disturb old thought complexes. The near groups of family and neighborhood lose their integrity, their communal quality. The individual grows out of or shakes off their controls as he enters the wider heterogeneous world of modern society. Frequently the emancipation is partial and the process is attended by conflicts, hesitations and doubts. Often, especially in smaller communities, the individual feels the pressure of the mores which he no longer accepts or he loses the assurance of an established order of belief and of life and is thus more at the mercy of circumstance. Moreover the stimulations and opportunities of the larger world have as their counterpart obstacles and frustrations. The economic struggle with its prizes and defeats, the competitive detachment of the individual and the swifter pace of a specialized life create various tensions. This is the setting in which many forms of maladjustment develop. When the transition from one set of habituations to another is sudden and complete, maladjustment is apt to be particularly manifest, as in the case of the soldier returning to peace conditions, the prisoner set loose, the countryman settling in the city, the peasant immigrant in the New World, the oriental thrust into industrialism. But these may be regarded merely as more extreme forms of the disturbances which are inherent in the changeful instability of modern civilization. The symptoms of

psychological maladjustment are most apt to manifest themselves at the crucial ages of the individual's life history, particularly at puberty.

Psychological maladjustment has consequently received an increasing amount of attention with a view to the development of practical arts for the mitigation, cure or prevention of the condition and its effects on personality. Various theories have been advanced as to the determining or precipitating factors. While the Freudian school stresses the disturbing effect, deep in the unconscious self, of sex inhibitions, others dwell more generally on the conscious tensions aroused by the conflict between the individual's desires and the restrictive demands of the social order. Some authorities, like Graham Wallas, have found a main source of maladjustment in the artificial character of urban civilization, which balks the inherited dispositions of man, or in the regimentation, monotony and narrow specialization of modern industrial work. Some, like Ogburn, point to the swift changes of a technologically inventive society, which induces nervous excitations and stimulates activities and habits that are unadjusted to the more slowly changing traditions and beliefs which form the cultural background of communal life. Others, particularly socialist authors, give more place to the insecurities of an economic system in which the individual or the detached family unit is subjected to competitive stresses and is at the mercy in respect of livelihood or fortune of precarious conditions far beyond the range of individual control. These various explanations are not necessarily alternative or contradictory but emphasize respectively different factors, the relative significance of which for different social situations requires to be assessed in a more comprehensive aetiology. Before this can be accomplished, however, greater attention must be given to the definition and the diagnosis of maladjustment. The norms to which maladjustment is relative vary with individuals and with groups, and it is futile to attribute maladjustment to those who merely follow different norms from those of their fellows. Maladjustment cannot be identified with such non-conformity and the psychiatrist, the alienist, the educationalist and the social worker must continually guard against such a tendency. It is only when the individual manifests symptoms of personal, or inner, disequilibrium—not when his personality is unified in a behavior discordant with that of his fellows, but when it is distracted by the failure to live his life in accordance with

a set of norms valid for himself—that psychological maladjustment can be predicated in any unambiguous sense. Unless this distinction is made, maladjustment remains a confusing and even a dangerous concept, as it implies both that the standards of the average man or of the majority are the measure of socialization and that they constitute the valid standards for all conduct within the group. A similar criticism may be brought against the more philosophical formulations, such as that of Spencer, which make adjustment the goal of living or identify the process of adjustment with progress. As sociologists like von Wiese have held, dissocialization as well as socialization is involved in the social process and in the business of living.

This point is of special significance because of the recent development of agencies for the remedial treatment of maladjustment, such as child clinics, psychiatric clinics, sanatoria, reformatories, juvenile courts and special schools. While some types of behavior abnormality can be traced to psychological maladjustment, others may just as plausibly be regarded as expressing the modes of adjustment of variant personalities to their social environment. The case study method, as employed by Thomas, Shaw, Healy, Bronner, Mowrer and others, reveals varieties of behavior response which have been too loosely herded together under the rubric of maladjustment. But it is still not infrequently assumed that all forms of delinquency and criminality are due to maladjustments within the personality of the offender, just as all forms of genius have been explained by another school as a higher expression of mental disequilibrium. The finer analysis made possible by the accumulation of case studies is preparing the way for a more discriminating and limited use of the concept. A difficulty has been the further assumption that there is for every social group one normal mode of life, all deviation from which may properly be treated as maladjustment. This viewpoint is suggested in much of the literature of social work. Maladjustment is the generic category in respect of which the task of social work is most frequently stated by social workers themselves. The Milford conference of social workers, for example, defined this task as "dealing with the human being whose capacity to organize his own normal social activities may be impaired by one or more deviations from accepted standards of normal social life" (*American Association of Social Workers, Studies in the Practice of Social Work*, no. 2, New York 1929,

p. 16). But the recognition that there are variant norms no less than variant abnormalities is necessary if one is to distinguish those abnormalities which can properly be assigned to psychological maladjustment from those which must be diagnosed and treated in other ways.

Since perfect adjustment—if indeed this has any meaning in a changeful society—is never attained, the incessant activity of readjustment is an omnipresent factor of social change, particularly in the more complex civilizations. There are moreover maladjustments which belong to type situations affecting considerable numbers, at times a whole social or economic class. Such group maladjustments are the inspiration of the greater revolutionary movements. Furthermore, while the thesis that genius is ipso facto maladjustment is unacceptable, there is sufficient evidence to suggest that those varieties of genius which find expression in art, in literature, in social reconstruction and in activities of domination are frequently stimulated by a sense of personal maladjustment. In this connection it may be maintained that genius always strives toward a different and a more difficult level of adjustment than that which is sought and found in the ordinary activities of mankind.

MALATESTA, ERICO (1853-1932), Italian anarchist. After being expelled from medical school for participation in a student demonstration Malatesta took up the trade of electrician. At first a Garibaldian republican, he joined the Italian section of the First International in 1872.

After the death of Michael Bakunin, his leader, he was the most active of the anarchist agitators and conspirators, participating in the revolts organized by the Bakuninists in Italy in 1874 and 1877. His life thereafter was an alternation of short sojourns and prison terms in Italy and tours in Europe, Argentina and the United States. Until 1919 his permanent residence was in London.

Although Malatesta founded no distinct school of anarchist thought, as early as 1876 he formulated the theory of what later was called communist anarchism. This was distinct from Bakunin's collectivist anarchism and was to find its chief theoretical exponent in Kropotkin. Malatesta envisioned the revolutionary process as a simultaneous action of all schools opposed to the existing system, leading to the expropriation of the capitalists and landowners. The anarchists would remain in opposition to any government constituted after the revolution and would endeavor by propaganda and example to win the majority to a stateless form of voluntary social organization. Experimentation would resolve differences among the various anarchist schools concerning problems of social organization and economic distribution.

In an endeavor to organize an anarchist-socialist-revolutionary party to prepare an armed revolution Malatesta sought to include anarchists of all schools, but his attempts at organization were opposed by many who saw in them a concession to the authoritarian principle.

Malatesta opposed support of either side in the World War, advocating the termination of the conflict by means of revolutions. In 1919 he returned to Italy and became editor of an anarchist daily newspaper, *Umanità nova*, in Milan. Confronted by the revolutionary situation of 1920 he held that the anarchists could not act without the cooperation of the other anticapitalist schools, since to try to enforce anarchism on the majority—to establish an anarchist dictatorship—would be contrary to anarchist ideology. He was nevertheless arrested in connection with the events of 1920 and entered upon a hunger strike. When his followers attempted terroristic protests against his imprisonment Fascists wrecked the offices of his newspaper. In 1922, when he attempted to publish a daily paper in Rome, his offices were again raided by Fascists. From 1924 to 1926 he published in Rome *Pensiero e volontà*, a theoretical review.

MĀLIK IBN-ANAS (713?-795), Moslem jurist. Mālik is the leading authority of the second of the four schools of law recognized by Sunnite orthodoxy. Most of his life was passed in his native city of Medina, where his interpretations of the legal traditions won him a position of great political importance. When the Alidic pretender Muḥammad ibn-'Abd Allāh seized power in Medina in 762, Mālik supported the cause of the rebellion with a legal opinion declaring that the oath of fealty to the Abbasside caliphs was not binding since it was obtained under constraint. For this he was severely punished by the ruling Abbasside. Later, however, he made his peace with the dynasty, and in the year of his death he was visited by the caliph Hārūn al-Rashid when he passed through Medina.

Mālik came of an educated and influential family, his grandfather and one of his uncles having excelled in the lore and science of tradition. His principal teacher was the jurist Rābi 'a ibn-Farrūkh, known for his work in founding a system of law based upon independent rational interpretation (*ra'y*). Mālik himself, though he did not reject this approach in principle and was in fact blamed for following too closely in this respect the position of the Mesopotamian jurists, laid the greatest emphasis upon the idea of anchoring all jurisprudence in religion on the basis of the Koran and tradition. In this way a religious dress was given to what was essentially the customary law practise (Sunnā) of old central Arabia and of Medina in particular. The establishment of the fact that a tradition existed on a given point was decisive for Mālik. In the case of conflicting traditions regarding the utterances or manner of life of the prophet he followed the consensus of opinion (*ijmā'*) prevalent in Medina. In such a case there was involved the question as to whether any religious objection had been raised against the given traditional solution.

Next to the infiltration of religio-ethical content into the material of the law Mālik is important because he represented the idea of systematization, although here he is not altogether a pioneer. His life work, the *Kitāb al-Muwatta'* (Delhi 1801), is permeated by the systematic tendency, and although it may not be the oldest code of Islam it attained by far the greatest influence; it had almost canonical authority, displacing contemporary works of equal merit. Obviously compiled in close connection with the author's lectures, the work was published in no fewer than fifteen versions, each differing considerably from the preceding, of which two have come down to us complete and exist in many printed editions.

Probably the best outline of the view of the Malikite school of law is the *Mukhtaṣar* (new ed. of original text by G. Delphin, Paris 1900) of Khalīl ibn-Ishāq (died c. 1374); a complete French translation of the *Mukhtaṣar* by M. Perron was published as *Précis de jurisprudence musulmane . . . selon le rite malékite* (Exploration de l'Algérie . . . Sciences Historiques et Géographiques series, vols. x-xv, 6 vols., Paris 1848-52); an English summary has been made by F. H. Ruxton from the French translation (London 1916). These views became the prevailing school of the western Islamic world. Upper Egypt, the Moslem states along the northern shore of Africa, whose orbit included old Moslem Spain as well as a large section of African Islam to the south, formed the extensive area in which the Malikite code enjoyed validity in practise.

MALINOVSKI, ALEXANDR ALEXANDROVICH. See BOGDANOV, A.

MALKAM KHAN (1833-1908), Persian diplomat, statesman and journalist. Malkam Khan was born of an Armenian Christian family but

was educated among Mohammedans. After completing his studies in Paris he returned to Persia and toured the country as a conjurer. He offended the religious feelings of the population and was ordered to leave the country. He returned again a few years later to found a Masonic lodge, Farámush Khánah (The place to forget), but the shah, afraid lest it become a conspiratory organization, closed it and asked Malkam Khan to leave the country for the second time. For a while he served as Persian ambassador in London. On February 2, 1890, he began to publish a Persian newspaper in London called *Qānūn* (Law). The initial motive of the paper was personal resentment against the shah and his ministers, its editorials assuming that everything in Persia could be improved by a mere change of cabinet. The original personal motive was, however, soon forgotten and Malkam Khan became the leader of the radical opposition to the old regime. The *Qānūn*, of which forty-one numbers appeared in three years, criticized severely the arbitrary and lawless regime of the shahs, the backwardness of the country and its domination by the religious leaders and demanded a constitutional form of government and a new code of law. Malkam Khan received the support and co-operation of the famous Islamic reformer, Jamāl al-Dīn al-Afghāni. Copies of the paper were smuggled into Persia despite a strict censorship and were passed secretly from hand to hand for many years after their publication. The *Qānūn* was the most important single factor in introducing liberal rationalistic ideas into Persia and in initiating a strong nationalist movement.

MALLET DU PAN, JACQUES (1749-1800), Swiss political and social critic. Mallet du Pan, the son of a Calvinist pastor, studied at Geneva, then one of the most brilliant centers of political science in Europe. Abandoning the academic sphere for the more exciting career of publicist he collaborated with Linguet in the famous *Mémoires historiques, politiques et littéraires sur l'état présent de l'Europe*, a suitable vehicle for a polyglot and cosmopolitan with an intimate knowledge of past and present European affairs. The *Mémoires* became merged with the *Mercure de France* and from 1788 until 1792 Mallet acted as political director of this important journal,

which during the first two years of the revolution was an organ of the aristocratic adherents of constitutional government. Linguet's awareness of the preeminent importance of the social substructure of the state he carried into the revolution, convinced that political authority was necessarily founded on force and on the economic subordination of the lower classes. As early as 1788 and 1789 he pointed out the essential issue of the crisis—the struggle of the third estate against the privileged classes. After the outbreak of the revolution he advocated, like Mounier and Clermont-Tonnerre, the establishment of a bicameral system, in which a lower chamber representing the third estate should have certain restricted powers alongside a strong monarch and an upper aristocratic house. But from 1791 on he veered steadily toward the extreme right, and in May, 1792, represented Louis XVI in a secret mission relative to the intervention of the German princes in the king's behalf. After August 10 he became an émigré, residing in Switzerland until the French invasion, when he fled to Germany and thence in 1798 to England. There during the last two years of his life he edited the *Mercure britannique* (1798-1800).

One of the few émigrés who retained some capacity for objective judgment, Mallet was an important observer and critic of the revolution. Despite a blinding hatred of the revolutionary changes, especially in the social and economic sphere, he sensed the overpowering vitality of the movement, the sources of which he analyzed in *Considérations sur la nature de la Révolution et sur les causes qui en prolongent la durée* (Brussels 1793; English translation, London 1793). He contrasted the galvanic force of the democratic uprising with the passionless attitude of the anti-revolutionary coalitions, which were fighting a war from which the "moral springs had been removed." He criticized the European governments for their lack of political wisdom in proclaiming their intention to effect a complete restoration of the old regime in France and pointed to the new social facts, such as the existence of a new class of property holders, which should influence the settlement of French affairs after the revolution. His program was essentially the compromise adopted by the Restoration government in 1814. While other émigrés reacted violently against reason and individualism, Mallet continued to uphold the right to think freely. In opposition to the "plot" theory of the revolution, which most of the émigrés eagerly

embraced, he pointed out the inexorable logic underlying the causes of events; frequently he played the prophet. Like Joseph de Maistre and a few other publicists he viewed the revolution as a drama in which foreordained catastrophes were unfolded and detected in its course the "finger of God." This theory found much favor with later determinists, particularly with the philosopher and historian Hippolyte Taine, who lauded Mallet's insight and attached much value to his writings.

PHILIPPE SAGNAC

MALLINCKRODT, HERMANN VON (1821-74), German publicist and politician. Mallinckrodt was the son of an aristocratic Westphalian landowning family. As early as 1848 Catholicism and romantic currents inspired in him strictly conservative political views. After studying law he was active in the Prussian administration, at first as burgomaster of Erfurt; he entered politics in 1852 as Westphalian deputy to the Prussian *Landtag*, where except for a period of four years he sat until 1863. Mallinckrodt thenceforth led the most outspokenly Catholic and conservative wing of the Center, for which his stirring speeches and numerous articles, especially in the *Westphalischer Anzeiger*, did much to win mass support.

He championed Catholicism against the attempt of von Raumer, Prussian minister of ecclesiastic affairs and education, to interfere with the church's independence. In the *Landtag* he joined the new *Katholische Fraktion* and soon became one of its leaders by virtue of his knowl-

edge of administrative questions and his deep moral passion. Looking toward final goals he followed the *Fraktion* into its alliance with the liberals against the government despite his conservative views. But when in 1859 the government passed from the hands of the *Junker* into those of the moderate liberals, he opposed the abandonment by the Catholic party of its name or of its aggressive policies; he held that to become the *Fraktion des Zentrums* would obliterate essential characteristics.

A legitimist and an advocate of Austro-German union, he opposed the war of 1866 and the resulting annexations. In 1867 he was elected on a clearly ultramontanist platform to the Diet of the North German Confederation, where he joined other adversaries of Bismarck in the federal constitutional association; here he became acquainted with Windthorst. Mallinckrodt's aim was to limit federal in favor of state power. On its establishment in 1870 he became a leader of the Center party, again insisting that its Catholic character be reflected in its name.

LUDWIG BERGSTRÄSSER

Consult: Schmidt, Franz, *Hermann von Mallinckrodt* (2nd ed. Munich 1921); Pfülf, Otto, *Hermann von Mallinckrodt* (2nd ed. Freiburg i. Br. 1901); Bachem, Karl, *Vorgeschichte, Geschichte, und Politik der deutschen Zentrumsparthei*, vols. i-viii (Cologne 1927-31).

MALLOCK, WILLIAM HURRELL (1849-1923), English publicist. The author of poems, novels and controversial works on religious and social questions, Mallock was known principally for his attacks on religious liberalism and on the democratic and collectivist trends in politics. His general social conservatism appeared in *The New Republic* (2 vols., London 1877; 2nd ed. 1877), a novel satirizing prominent publicists and literary men of the day, the first of his works to attract wide attention. Throughout his later works runs the doctrine that the reins of economic and political control lie properly and inevitably in the hands of minorities distinguished by superior brains and character. The reliable signs of these excellencies are to be found in economic success and social position, as these marks of distinction appear in a society where private property in its traditional legal forms is vigorously protected and free competition generally unrestrained by government and where political privileges are allotted on the basis of wealth and education. He contended that the increase in per capita wealth during the past century had been due almost wholly to the skill and diligence of financiers, industrial entrepreneurs

and inventors. The laborer, he argued, could by his efforts alone produce no more than he did a hundred years earlier.

Malloch's clear, epigrammatic style and agile use of factual detail attracted a considerable following, although professional statisticians attacked his work. He recognized no need to prove basic generalizations, which were for him assumptions indispensable for the discussion of political and economic policy; and although he criticized many evils of democratic society he was lacking in concrete proposals of alternatives. He was an important force in contemporary antisocialist propaganda.

FRANCIS W. COKER

Important works: *Social Equality* (London 1882); *Aristocracy and Evolution* (London 1898); *A Critical Examination of Socialism* (London 1907); *The Limits of Pure Democracy* (London 1918).

Consult: Shaw, Bernard, *Socialism and Superior Brains: a Reply to Mr. Malloch*, Fabian Tract, no. 146 (London 1909); Smith, Charles D., *Natural Monopolies in Relation to Social Democracy* (London 1909); Rockow, Lewis, *Contemporary Political Thought in England* (London 1925) ch. iv; Hobson, John A., "Mr. Malloch as Political Economist" in *Contemporary Review*, vol. lxxiii (1898) 528-39; De Leon, Daniel, *Marx on Malloch* (New York 1908).

MALMSTRÖM, CARL GUSTAF (1822-1912), Swedish historian. Malmström became professor at the University of Uppsala in 1877 and was also head of the Swedish Record Office for five years beginning in 1882. He was a member of the cabinet from 1878 to 1880 but played no political role. His fame rests chiefly on his great work *Sveriges politiska historia från konung Carl xii's död 1718 till statshövdningen 1772* (The political history of Sweden from the death of Charles XII in 1718 to the revolution of 1772, 6 vols., Stockholm 1855-77, new ed. 1893-1901), which is considered among the most excellent of Swedish historical writings. Based on a careful study of the rich documentary material, it gives for the first time a comprehensive account of the troubled period in Swedish history known as *Frihetstiden* (the age of freedom), which was characterized by unlimited parliamentary power following as a reaction from royal autocracy. Malmström gives a detailed account of the economic and social development of the country in this period and analyzes with great clarity the struggle between the political parties as well as the obscure relations which existed between the political leaders and the foreign powers that threatened Sweden's independence. He is neither brilliant nor profound,

but his account of events fascinates through its clarity, simplicity and absence of rhetoric. Because of its subject and Malmström's treatment the work is exceedingly instructive, especially in view of the similarity between the political life of *Frihetstiden* and that of present day Sweden.

Malmström was a man of the old school, conservative, loyal and earnest, who considered the health of the state essential for the welfare of a nation. He was one of the first Swedish historians to master modern historical technique and always endeavored to avoid subjective judgments and constructions. He was one of the founders of the Swedish Historical Society, of which he was chairman for many years, and he exerted a strong influence on the younger school of historians.

MALNUTRITION. *See* NUTRITION.

MALON, BENOÎT (1841-93), French socialist. Malon, the son of a peasant, worked as a shepherd and farm hand; in 1865 he went to Paris, where he worked as a dyer in a factory and obtained some education in evening courses. His membership in the First International, which he joined in 1866, cost him two terms in prison but gained him a certain notoriety. On February 8, 1871, he was elected to the National Assembly, from which he resigned simultaneously with Henri Rochefort after voting against the peace treaty. He was a member of the important Commission of Labor, Industry and Trade of the Paris Commune, struggled up to the last day of the insurrection and then fled to Switzerland. He returned to France with the amnesty of 1880 and was with Jules Guesde one of the founders of the *Parti ouvrier*. Malon founded the monthly *Revue socialiste* in 1885, to which he devoted all his efforts until his death. He was the author of approximately twenty volumes of socialist propaganda and popularization.

In 1885 he separated from the *Parti ouvrier* and founded an independent socialist party occupying a theoretical position opposed to Marx and Guesde and closely akin to the more famous German revisionists. Malon considered the economic materialism of Marx to be narrow and formulated a theory of social evolution which postulated the ideals of justice and pure law as

effective basic forces. He argued that humanity carries in itself such preconceived ideals and pursues them from civilization to higher civilization, moving under their obscurely felt influence. He opposed to the revolutionary strategy of the Marxists the reformist method ("possibilism") and looked to universal suffrage and the aid of enlightened bourgeois elements to make revolutionary tactics unnecessary. While Malon is closely linked to the history of the Commune and of French socialism he exercised slight influence on the French labor movement in general.

ALEXANDRE ZÉVAËS

Important works: *La troisième défaite du prolétariat français* (Geneva 1872); *La question sociale, histoire critique de l'économie politique* (Lugano 1876); *Le nouveau parti*, 2 vols. (Paris 1881-82); *Histoire du socialisme*, 5 vols. (Paris 1882-85); *La morale sociale* (Paris 1886, new ed. 1896); *Le socialisme intégral*, 2 vols. (Paris 1890-91, 3rd ed. 1892).

Consult: Spuller, Eugène, *Figures disparues*, 3ième série (Paris 1894) p. 233-51; Peyron, Élie, "Benoît Malon" in *Revue socialiste*, vol. xxxiii (1901) 257-88.

MALTHUS, THOMAS ROBERT (1766-1834), English economist, sociologist and utilitarian moralist. Malthus' entire social and economic thought may be said to center about his theory of population. According to this theory population when unchecked increases at a rate so much more rapid than it is possible to increase food supply that numbers are constantly pressing on means of subsistence; or, as Malthus himself somewhat unfortunately put it, while population increases in geometrical ratio, food supply can increase only arithmetically. The law had been stated previously by a number of writers, and it was only in his analysis of the mechanism of adjustment that Malthus claimed originality. In the first edition of his *Essay on the Principle of Population* (1798) he limited the possible checks on population to misery and vice. The strong tendency of his thought was to consider that at least the bottom of the social pyramid was always at the bare physical minimum of subsistence. In the second edition (1803), which was greatly amplified and modified in the light of his intervening travels and reflections, he introduced a third check, "moral restraint," which he thought had operated in civilized countries to maintain even the laboring classes at a level considerably above the physical minimum. Thus he introduced the doctrine of a "standard of living" determined by "habit" rather than by purely physiological causes as a

regulator of population. But in either case his theory stressed the constancy of the standard, however fixed. The fact that a change in economic conditions brought no change of standard but only a decrease or increase of numbers at the same standard placed almost insuperable difficulties in the way of a permanent improvement in the condition of the working classes. In the later phases of his work he also developed greatly his ideas on the subsistence side of the problem, laying less emphasis on the empirical arithmetical ratio and more on the conditions underlying it. This led him to discover independently, although he was not the first to do so, the theory now called the Ricardian law of rent and its implication, the law of diminishing returns. The latter law, however, he never formulated explicitly.

Malthus' essay was in part an attack upon the indiscriminate policy of charity, particularly as exemplified by Pitt's poor law bill of 1796, which the conservative government was pursuing in its efforts to cope with the distress resulting from the breakdown of the feudal and mercantile society and the attendant emergence of modern industrialism. It was at the same time a devastating response to the utopian thinkers—represented chiefly by the rationalistic-anarchistic philosophy of Godwin—who under the impulse of the French Revolution had reexpressed in extreme form the optimistic version of English utilitarianism. To Godwin's thesis that a regime of ideal equality both in property and sexual relations could be brought into existence by the mere removal of institutional restraints and the release of the triumphant power of reason, Malthus replied that only the individual pursuit of self-interest working within the framework of the institutions of property, marriage and class division could save society from the unlimited increase of population and complete disintegration. Malthus' social philosophy represents a recrudescence of the Hobbesian current in utilitarianism, with important differences. He conceived of man as dominated not by a multiplicity of passions but by one, "the passion between the sexes." From this it followed that the Hobbesian conception of the basic disharmony between individuals was transformed by Malthus into the idea of a cleavage between the great classes—landlords, capitalists and laborers—into which society was divided by the conditions necessary to procure subsistence. Finally, Malthus like the other classical economists considers self-interest not as

wholly destructive but as the chief mitigating principle, the *vis mediatrix rei publicae*, enabling man to avert the worst of the evil consequences of the pressure of population. This is the last remnant in Malthus of any idea of a natural harmony of interests.

Some of the most prominent features of the classical system of economics resulted from the modification of the Smithian doctrines necessitated by Ricardo's acceptance of Malthus' ideas. The principle of population and the theory of diminishing returns and of rent were the principal elements which Ricardo worked into a theory of the distribution of wealth marked by the iron law of wages and the tendency of profits to decline. But while on the distribution side of the analysis Malthus and Ricardo were at one in substituting the assumption of class antagonism for the conception of the natural harmony of interests which, although modified by other elements, predominated in Adam Smith, they differed fundamentally with respect to the theory of value. The labor theory as foreshadowed by Locke and developed by Smith started from a "state of nature" characterized by a natural equality and harmony of interests. While Ricardo fully recognized the difficulties involved in its application to a capitalist society, on the whole he adhered to the same type of thought, although reluctantly. His followers, however, forgot his qualifications and hardened his theory into dogma. Malthus, on the other hand, emphatically denied the postulate of equality implied in the more orthodox form of the labor theory and based his theory of value as well as of distribution squarely on the principle of population. He was therefore more consistent than Ricardo, even though the general tendency of his work was more empirical; this fact and the implications of his basic principle led him at times in his discussion of value to emphasize demand rather than cost of production. It was also because of fidelity to the theory of population that Malthus favored moderate protection for agricultural products and became almost the sole exception among the economists of his time to the predominant free trade sentiment, as applied especially to the corn laws.

In addition to the great impetus he gave to demographic studies Malthus' ideas exerted an influence on social theory subsequent to the classical economics in at least two other important respects. First, the element of disharmony, which he introduced into the economy of competitive individualism, was one factor which

paved the way for Marx' use of the Ricardian doctrines in his theory of the evolution of capitalist society. Secondly, Darwin drew from Malthus important elements of the theory of natural selection. The tendency for reproduction to outrun subsistence, generalized to include all organic life, gave the surplus of numbers on which selection could operate. In fact Malthus himself made use of the phrase "struggle for existence."

MALTHUSIANISM. See POPULATION; BIRTH CONTROL.

MALYNES, GERARD DE (flourished 1586-1641), English writer on economic subjects. Malynes, a prominent although apparently not a very successful merchant, held the post of assay master at the mint and was frequently employed both by Elizabeth and James I as adviser on commercial questions. Despite his extensive commercial experience his economic ideas as expounded in a number of books and pamphlets

centered about a faith in traditional governmental restrictions, particularly the bullionist measures, which were fast losing significance in contemporary business practises, and stressed the evils resulting from the unsupervised activities of foreign exchange dealers. In one of his first works, *A Treatise of the Canker of England's Commonwealth* (London 1601), he lamented that exchange had become a "merchandise" rather than a "permutation" of coins according to bullion content. Arbitrage operations (*cambio sicco*) and finance bills (*cambio fictitio*) he branded as concealed usury and attributed the depreciation of sterling to the machinations of private exchangers. In 1622 he became embroiled in the first important economic controversy in England. While his antagonist, Edward Misselden, declared in opposition to the bullionist doctrine that specie outflow was the result of an unfavorable balance of trade, Malynes argued that "both commodities and money are passive, since the exchange was invented, which is only active," and that inflow of specie could be insured only by restoring the royal exchanger with a monopoly over exchange transactions. During the course of the controversy he published besides *Maintenance of Free Trade according to the Three Essentiall Parts of Traffique* (London 1622) and the *Center of the Circle of Commerce* (London 1623) *Consuetudo vel lex mercatoria* (London 1622, new ed. 1686), which contains his whole system of economic ideas and is the most accessible source for a study of them. It is important also as the first comprehensive treatment of the law merchant by an Englishman and for its part in acclimatizing the commercial law doctrine of the civilians in English common law. In his *England's View in the Unmasking of Two Paradoxes* (London 1603) while paraphrasing Bodin's refutation of Malestroit he accused Bodin of neglecting the real issue—the differential increase in prices between countries resulting from the activities of exchange dealers. His attack upon usury in *Saint George for England, Allegorically Described* (London 1601) was mediaeval in flavor, although he realized that interest could not be forbidden and refuted Culpepper's proposal for a legal limitation of interest rates.

Despite the vigor of his writings Malynes, one of the foremost English bullionists, failed to convince his contemporaries that the cambists were responsible for gold outflow or to elicit enthusiasm for a monopoly sale of exchange, *par pro pari*, by the royal exchanger. For a cen-

tury of rising commerce his advocacy of a *monopietatis*, a conception in harmony with his general sympathy for the poor, had little attraction. "In vain," wrote Thomas Mun, "hath Gerard Malynes labored so long and in so many printed books." But in a sense the very dogmatism with which Malynes espoused lost causes helped to crystallize the views of his opponents and so to develop the balance of trade doctrines.

MAMIANI DELLA ROVERE, CONTE TERENCE (1799-1885), Italian writer, philosopher and statesman. Mamiani, who was born in Pesaro and educated in Rome, early became a liberal and patriot. Like so many of the leaders of the Italian Risorgimento he combined the vocation of an intellectual with the career of a man of action. In his early years he was professor of Italian literature at the Military Academy of Turin. In 1831 he took part in the revolutionary government at Bologna and after several months' imprisonment was exiled to Paris until 1846. During these years he was active as a philosopher, assuming a position of moderate empiricism and polemizing against the idealistic philosophy of Rosmini. After 1850, however, he made common cause with the Italian idealistic school, whose doctrines he sought to tie up with a modified form of Platonism. During the constitutional period of 1848 he was twice minister under Pope Pius IX. On the papal restoration and the occupation of Rome by the French in 1849 he retired to Genoa, where he established the *Accademia di Filosofia Italica* with the hope of founding a lasting school of Italian thought free from the fetters of theology. He was deputy in the Piedmontese parliament and minister of education under Cavour. He also taught the philosophy of history at the University of Turin from 1857 and after 1870 at Rome. Under the unified state he became a sort of high priest of the official philosophy, founding in this connection the important review *Filosofia delle scuole italiane*, which he edited from 1870 until the time of his death.

A large part of Mamiani's intellectual activity was devoted to the application of his philosophic ideas to questions of political and social theory.

In 1841 in a series of letters exchanged with Mancini he discussed the foundations of penology and held in opposition to the latter that the aims of law and morality were identical and that punishment was a matter of rewarding evil with evil. In a more important juristic work, *D'un nuovo diritto europeo* (1859), he sought to establish European public law on the foundations of liberalism and the self-determination of nationalities. Several of his works were devoted to the question of the church and religion. In his *Teoria della religione e dello stato*, which was placed on the Index, he assailed the privileges of all the churches, including the Roman Catholic, and maintained that they should be subject to the regime of public law as in the United States. He also outlined in his *La religione dell'avvenire* a positive and permanent religion for mankind on the basis of the everlasting revelation of God in the individual mind of man. In his last years Mamiani was preoccupied with social and economic questions and in a treatise entitled *Delle questioni sociali e particolarmente dei proletarij e del capitale* defended the institution of private property but pleaded for governmental measures to improve the economic condition of the proletariat. As always he maintained the primacy of the moral problem over economics and politics.

MAN. In bodily structure, in processes of growth, in long foetal development within the maternal uterus and subsequent suckling of the young at the maternal breast man conforms

wholly to the pattern of placental mammals. The inclusion of man in the primate order rests upon his possession of five mobile digits on hands and feet, provided with flat nails instead of claws, the thumbs and great toes being more or less capable of opposition to the ends of the other digits for grasping. This classification of man is further supported by an overwhelming number of identities and similarities in anatomical and physiological details. With the New World monkeys, the Old World monkeys and the anthropoid apes man shares the possession of a large and highly convoluted forebrain which overhangs the hind brain, bony eye orbits with nearly complete back walls, frontally placed so as to permit stereoscopic vision, and other structural minutiae which define the Anthropea, the highest of the primate suborders.

Man resembles all of the anthropoid apes, especially in the lack of an external tail, in the intricacy and pattern of cerebral convolutions, in the suspension of the viscera within the body cavity so as to permit erect posture without prolapsus or sagging, in serological or blood reactions, in the prolonged period of embryonic development and postnatal growth, in the reproductive cycle. The human animal diverges from the gibbon and approximates the great anthropoids primarily in the vastly greater body bulk and size, in the specialization of the bony pelvis for support and transmission of the body weight to the lower limbs and in lesser elongation of the fore limbs, the hands and the feet.

Man differs physically from the anthropoid apes and the lower primates in the great absolute and relative size of his brain; his supporting, non-prehensile foot with its massive, non-opposable great toe; the reduced size and lessened protrusion of his jaws; the development of a positive chin eminence and the absence of projecting, interlocking canine teeth; the possession of a lumbar curve and a basin shaped, tilted pelvis modified for the functions of balancing and supporting the body in the erect posture; greatly hypertrophied and elongated lower limbs adapted for biped gait; shortened and refined upper limbs with broad hands provided with long and perfectly opposable thumbs and short fingers; a prominent nose with well developed tip and wings; complete absence of tactile hairs or feelers together with a marked sparsity of secondary body hair except on the head, in the pubic and axillary regions and on the face of adult males; and the presence of full everted membranous lips.

Man as well as the monkeys and apes possesses a specially sensitive retinal area and stereoscopic vision not shared by the lower primates and other mammals; he is thus able to discriminate objects in relation to form, size and distance. It is doubtful whether these powers are employed by other primates to the same extent as by man. The sense of smell in the primates may be inferior to that of lower terrestrial animals, but little experimental evidence is available on this point. Hearing is probably as acute in primates as among the lower mammals. Especially developed is the sensitiveness of the hands in touch, in which respect man appears to outrank the apes and monkeys. The free employment of a superlative tactile and visual equipment is intimately related to the ability of "picturing movements," to the recollection of past events and to the anticipation of future actions. By the adoption of a terrestrial life and the assumption of an erect posture and biped gait protohuman primates emancipated their hands from locomotor functions and brought to full fruition the powers engendered by their bodily inheritance and fostered by the arboreal habitat of their ancestors.

Although apes and even monkeys have a limited ability to utilize and devise tools, man is the only animal who may be said to possess a material culture. He owes this acquisition to his superior intelligence and his greater ability to profit by experience rather than to any gift of manual dexterity or to any accident of environment. The development and transmission of culture are made possible by the power of articulate speech, the most effective means for the communicating of ideas and for the elaborating of mental processes. Man shares this power with no other animal. Physiologically it is related to the enormous size and complication of the human brain and of the entire nervous system. Yet no anatomist or physiologist can designate a single specific anatomical feature of man the absence of which determines the lack of language in the great apes. Even the so-called speech area, the third inferior frontal convolution of Broca, is distinguishable in the brains of chimpanzees and gorillas.

The complex and variable character of human social organization is also dependent upon cumulative transmission through the medium of language. The social groupings of man are culturally conditioned, whereas those of the subhuman animals seem to be principally instinctive. Zuckerman has demonstrated that the

factors underlying the associations of apes and monkeys are characterized by their continuous sexual nature, as contrasted with the intermittent character of the sexual bond in lower mammals. This permanent sexual association is a common possession of all primates, but man differs fundamentally from other members of the order in his more clearly defined sexual responses and their greater dependence upon cultural factors and in his appreciation of their social significance. These differences are possibly quantitative rather than qualitative (see LANGUAGE; CULTURE).

Since the evidence of biological science indicates that man has evolved from a lower primate ancestor, it is possible to fix approximately the time of his achievement of a human status by considering the data of palaeontology and geology. The first remains of primates occur in the Palaeocene, or Lower Eocene, the first period of the Tertiary epoch. In the Oligocene period primitive types of Old World monkeys first appeared, as did *Propliopithecus*, a very small gibbonlike ape which probably stands at or very close to the point where the common ancestral stock of the anthropoid apes and man branches off from the primate trunk. In the Miocene deposits of the Old World full fledged types of gibbons are already represented together with Old World monkeys and generalized forms of the giant anthropoid apes—the *Dryopithecus-Sivapithecus* group, which is probably ancestral to the present chimpanzee and gorilla and perhaps also to man. It was during this period that the ancestors of man probably attained giant primate size and became erect terrestrial bipeds. A small minority of students of primate evolution contend that the human ancestral stock diverged from the primate trunk before the development of ancestral forms of the great apes, probably in the Oligocene period. Wood Jones postulates an independent development of the human line from the base of the tarsoid trunk, thus removing from human ancestry both Old World monkey and anthropoid ape stages of development. Osborn thinks that man's ancestors became small, ground dwelling, erect walking primates as early as the Oligocene period and would exclude the generalized great anthropoids from the human line of descent. The consensus of expert opinion, however, derives man from a giant, brachiating, anthropoid stock and places the separation of the human branch from the generalized great ape stem either in the late Oligocene or more probably in the Miocene

period. Some of the best authorities maintain the close collateral relationship of man, the gorilla and the chimpanzee. No competent student accepts the view that man has descended from any existing type of anthropoid ape.

No remains of man which can be attributed with certainty to the Pliocene period have yet been recovered, but the fact that primitive human types were already widespread in the Old World is indicated by archaeological data of the beginnings of a tool making culture. The stone implements of extinct types of man are naturally more numerous and less perishable than their skeletal remains. For many years archaeologists have argued concerning the possibility of recognizing humanly chipped and utilized stone implements before the latter have been fashioned into unmistakable artifact types by convention and through the increased skill of their makers. The existence of amorphous chipped stones called eoliths has been claimed in deposits of every geological period from the Eocene upward. A consideration of the palaeontological evidence as to the development of the primates and other mammals seems to indicate that no humanoid form was sufficiently highly evolved to reach a tool using stage before late Miocene or early Pliocene times. Ancestral forms of man, however, used and made tools before they had reached a degree of skill in their manufacture which would make such tools easily recognizable. While withholding decision on the difficult question of distinguishing between naturally chipped stones and those early and dubious eoliths, one may yet accept the judgment of Breuil and Sollas that the implements found in the Red Crag at Foxhall near Ipswich, Suffolk, are genuine human artifacts. Moir's discovery of a floor on which early man lived, used fire and chipped unmistakable implements during the Upper Pliocene period amply attests the presence in England in preglacial times of a being already possessed of more than the rudiments of a material culture and presumably equipped with all of the physical attributes which can be distinguished as human. From the beginning of the Pleistocene, or glacial, epoch down to recent times there has been recognized and described a sequence of stone implement cultures which become more diversified and better defined in succeeding archaeological strata. In many cases the skeletal remains of fossil men of the later periods are associated with these implements in undisturbed deposits.

It is not yet possible to assign definite and

absolute chronological limits to the various stages of human development. Time scales have been developed by geologists to measure roughly the antiquity of different rocks and fossil beds. The estimates vary enormously according to the method used and the personal equation of the investigator. Probably the most precise method of determining geological age is by the study of the rate of disintegration of radioactive elements found in the igneous rocks of various periods. Such a radioactive time scale assigns roughly one million years to the Pleistocene period with its four glacial advances, perhaps six million to the Pliocene period and twelve million to the preceding Miocene. If such a time scale is tentatively accepted one must suppose that man's ancestors—giant terrestrial bipeds with emancipated hands and non-prehensile, supporting feet—appeared before the end of the Miocene period, or some seven millions of years ago. On the same basis the human utilization and fabrication of tools would begin at the latest in mid-Pliocene times and the beginning of culture would be dated approximately four million years ago. The regular and undisputed sequence of archaeological cultures of man, beginning with the Lower Pleistocene, stretches over more than one million years according to this calculation. Some geologists on the basis of sedimentation assign much shorter periods to the Pleistocene and preceding epochs, cutting down the estimates to one half or less of those yielded by the radioactive scale. The tendency of archaeologists working downward from the most superficial deposits to the oldest containing human artifacts is to be increasingly conservative in their estimates of the antiquity of human culture measured in lapse of years. Keith wishes to compress the Pleistocene and the Pliocene, within which are included the evolution of all known forms of fossil men from humanoid prototypes, into a total of 450,000 years. Ultimately, however, the student of man must depend upon the more exact measures of time developed by geologists and physical chemists rather than upon any archaeological estimate of the rate of culture change or upon any biological prejudice as to the period required for evolutionary modification.

Palaeontological evidence concerning the distribution of fossil primates sets up boundaries which delimit the probable areas of man's differentiation from an apelike ancestry. In the New World there are no fossil anthropoid apes, nor have archaeological finds thus far produced

any convincing evidence of a high geological antiquity of human occupation. While it is still possible that further investigations may reveal the presence of man in North or South America during late glacial times, he could have reached the New World only as a comparatively late migrant physically evolved to approximately his modern status and having already acquired more than the rudiments of a culture, including some knowledge of navigation. The low zoological rank of the fauna indigenous to Australia precludes the possibility of higher primate evolution in this continent, although it was probably peopled in late Pleistocene times. In spite of the indubitably great antiquity of man in Europe and the discovery there of a number of the most ancient human types that continent must be considered primarily as a western extension of the great Asiatic land mass and seems to have derived its ancient fauna and early human inhabitants by migrations from Asia and from Africa.

During Miocene times giant generalized anthropoids of the *Dryopithecus* and allied families inhabited a forest zone extending on both sides of the Mediterranean from the Atlantic seaboard eastward and across the southern portion of Asia to its southeast extremity, including the Indian peninsula and presumably Indo-China and the adjacent great islands of Java, Borneo and Sumatra. Somewhere within this zone or at its margin the human stock probably differentiated from its anthropoid forbears. There are no convincing evidences favoring the claim of the African region of this anthropoid zone as the birthplace of man over that of Asia or vice versa, in spite of the predilections of many palaeontologists in favor of one or the other continent either on account of its size, its yields of ancient human or anthropoid types or the antiquity of its cultural deposits. It should be noted, however, that most students assume an Asiatic origin of the human family. Granting that man's humanoid precursor was a progressive anthropoid already adapted for life on the ground and virtually of present human size, it seems probable that such a terrestrial and migratory prehuman stock would disperse throughout the entire anthropoid zone and would at several places continue to evolve toward a human status, differentiating into a number of distinct genera and species. Such a view is polygenetic only so far as it postulates the diversification of several ancient species of man, of varying degrees of evolutionary development, from a common humanoid stock. The only scientific alternatives to

this opinion involve either the presumption that the common prehuman stock remained stationary in some unspecified geographical area and thence sent out successive human mutations of progressively higher evolutionary status, or that all of the morphologically heterogeneous and geographically dispersed types of fossil man can be arranged in some sort of unilinear genetic series, each directly descended from one of the others. The former view is favored by some students of human origins; the latter has few if any adherents. Neither is acceptable, for evolution is a continuous process operating upon all animal species in all places according to the requirements of natural selection and the possibilities inherent in their organisms.

Almost every year adds some new find to the considerable assemblage of skeletal remains of geologically ancient man. The most important of these are the *Pithecanthropus erectus* of Java, a being hardly human with a very small apelike skullcap and a quite modern femur indicating an erect biped gait; the *Sinanthropus* crania of Peiping, China, representing an advance over the Javan specimen in frontal and parietal brain development, with teeth showing enlarged pulp cavities; the enigmatic *Eoanthropus* of Sussex, England, with essentially modern brain case and chimpanzeelike mandible having projecting canine teeth; the Heidelberg lower jaw—massive, chinless but splayed out posteriorly in modern fashion and provided with teeth of moderate size again showing enlarged pulp cavities; the Rhodesian man with gorillalike brow ridges, huge jaws in which are implanted badly decayed teeth of modern form and with features of the skull base and limb bones indicative of a completely erect posture; the rapidly increasing array of Neanderthal skeletons, all with great brow ridges, low cranial vaults, projecting jaws, chins rudimentary or absent and "taurodont" teeth showing the enlarged pulp cavities. Difficulties constantly recurring in the interpretation of these fossil skeletons are: doubt as to their exact geological provenience; the possibility that a mixture of bones of different individuals and distinct species in the same deposit may result in reconstructions of fictitious types; ignorance of the range of individual, sexual and specific variation in fragmentary fossil forms, which causes anatomists to recognize new genera or species that may never have existed. There is no general agreement upon the genetic relationship of these various forms of ancient man, nor do geological facts afford a sufficiently precise dating of most

finds to enable them to be placed in a chronological sequence. The occurrence of a type in a given geological horizon does not necessarily imply that the form of man in question first evolved or finally became extinct in that period. Pliocene forms may persist into Pleistocene times and exist contemporaneously with newer and more progressive types.

Pithecanthropus erectus undoubtedly represents an intermediate form between man and his anthropoid ape ancestors. The *Sinanthropus* type of China seems to bridge the gap between *Pithecanthropus* and the more highly evolved Heidelberg-Neandertal line of fossil men with taurodont specialization and many generalized anthropoid features. Rhodesian man may be an early offshoot of this same stock. The recent discovery of a series of skeletons in a cave at Athlit, Palestine, associated with a Mousterian stone chipping industry, possibly indicates a differentiation of a Neandertaloid group in the direction of a more modern and perhaps Australoid type. The Piltdown skull, *Eoanthropus Dawsoni*, if the association of mandible and brain case is valid, stands completely apart from the *Sinanthropus*-Heidelberg-Neandertal line and may be derived from the stock which ultimately produced all or nearly all the existing human varieties. Conservative students hesitate to place any of the ancient fossil types mentioned in the direct ancestral line of modern man, preferring to regard them as abortive offshoots. It is wholly possible, however, that future discoveries will disclose intermediate forms which will permit the assignment of one or more of these fossils to the stem which leads to *Homo sapiens*—to which, it is commonly held, existing types of man belong. This species has differentiated into three principal varieties, Negroid, Mongoloid and white, in comparatively recent times—perhaps not before the latter part of the Pleistocene period. The conception of the specific unity of modern man is based upon the physiological criterion of fertility in crossing; upon the common possession of many morphological features; upon the belief that existing differences between the principal human groups arise from conditions of domestication and from selectional or adaptive modifications. Such modifications are attributed to climatic and other environmental factors which have operated upon geographically isolated human groups over long intervals of time. The morphological, physiological and psychological resemblances which unite all races of modern man are considered too numerous

and too close to be explained by the hypothesis of convergent evolution of separate stocks. While this argument has a certain measure of scientific validity it is not altogether compatible with the demonstrated multiplicity of species and possibly even genera of fossil human types. Several anatomically modern forms of fossil man have been found in Upper Pleistocene deposits. These display in certain cases combinations of features generally considered distinctive of the Negroid, Mongoloid and white groups. Some students regard these late fossil forms as undifferentiated prototypes of modern man antedating the segregation and intensification of Negroid and other group characters. It is equally possible to consider them early examples of hybridization, since similar combinations are found in recent offspring arising from known crossings of physically divergent races. The view here favored is that the principal varieties of modern man had already differentiated from a common stock before the end of Pleistocene times and that the prototype of *Homo sapiens* is still to be discovered. It must be recognized, however, that Negroids, Mongoloids and whites resemble each other in skeletal features more closely than any of them resemble the older fossil human types, to which, admittedly, separate specific classification must be assigned. This fact militates in favor of the opinion that all present human groups have sprung from some common ancestral stock rather than from diverse species of fossil man either known or as yet undiscovered.

The formation of races among the principal varieties of *Homo sapiens* is attributable to one or more of the following causes: inbreeding and selection of the favorable variations of groups isolated in specific physical environments; mutations; hybridization of physically diverse stocks and inbreeding and selection of the mixed offspring of such crossings; adaptive modifications of isolated groups to such environmental factors as diet, amount of moisture, intensity of sunlight and geographical elevation. Most anthropologists proceed upon the facile and probably erroneous assumption that different degrees of human pigmentation are directly attributable to amount and intensity of sunlight to which numerous ancestral generations have been exposed in some region of isolation, and that other racial characters are similarly environmentally actuated and in some inexplicable method transferred to and fixed in the germ plasm. There is, however, an almost complete lack of evidence

which would establish a direct causal relationship between any heritable racial anatomical feature in man and specific environmental factors. Race is a matter of a common physical inheritance from the same group of ancestors, and racial characters are inherited not acquired. The only dependable criteria of race are found in non-adaptive, heritable, physical features. These are due to inherent tendencies in diverse stocks toward variation along specified lines in different parts of the organisms, selected doubtless to some extent by their favorable or harmful character but largely of an indifferent nature and hence limited only by the variational capacity in the original strains. The mechanism of such racial differentiation is probably the secretions of the ductless glands, or endocrines, but the endocrine balance is also largely an inherited feature, not simply an effect of diet or other extrinsic factors.

The geographical distribution of finds of archaic types of fossil man may be roughly delimited by a quadrilateral, of which the northwest corner is at Piltdown Common, Sussex, England, the southwest corner at Broken Hill, Northern Rhodesia, the southeast angle at Trinil, Java, and the northeast at Peiping, China. Only the Spanish peninsula with its finds of Neandertal man forms a westward salient of this quadrilateral. Within this area are included also all geologically ancient types of *Homo sapiens* heretofore discovered with the exception of those disinterred in a South African extension. Knowledge is at present insufficiently complete to allow more than a tentative or even speculative sketch of the original differentiation and dispersion of the human races from within this quadrilateral. The southwestern angle of the quadrilateral is not far from the probable center of diffusion of the African Negro stock, which seems to have dispersed from the lake region southward and westward. The southeastern corner was formerly the seat of an archaic, eastern branch of the Negroid group, which has now been pushed out for the most part to Melanesia by the southward thrust of mixed Mongoloid Malays. An ancient Negroid stratum has survived in the Indian peninsula, overrun and submerged by invasions of brunet whites. From the southeastern Asiatic angle there also migrated to Melanesia and Australia at some prehistoric period the archaic and problematic Australoids. The northeastern angle of the quadrilateral is probably somewhat east of the center of diffusion of the great Mongoloid stock, concerning

whose origin and affinities very little is known but who migrated in all directions from the central Asiatic plateau and peopled the New World. On the basis of present evidence the dispersal of the Mongoloids seems to have been subsequent to the occupation of the southeastern, eastern and northern Asiatic areas by ancient white and Negroid stocks which they displaced and with which they mixed. The central belt of the quadrilateral, extending on both sides of the Mediterranean Sea eastward through Mesopotamia and as far as India, seems to have been the ancient seat of long headed whites, who pushed out to the northwest in late Pleistocene times or possibly earlier and eventually extended their domain to Scandinavia and the northern Asiatic steppes and even as far eastward as China. The western half of the northern marginal band was probably the center of differentiation and diffusion of two brachycephalic white races—the Armenoids and the Alpines—and the eastern half the original home of the Mongoloids.

MANAGED CURRENCY. *See* MONEY.

MANAGEMENT may be defined as the process by which the execution of a given purpose is put into operation and supervised. The combined

output of various types and grades of human effort by which the process is effected is again known as management, in the human sense. Again, the combination of those persons who together put forth this effort in any given enterprise is known as "the management" of the enterprise. The term therefore covers the process of managing, the combined human ability involved in managing and the personnel required to manage.

The word is also generally used somewhat loosely to describe the general conduct and control of an enterprise, irrespective of the different functions involved. A more precise significance is, however, coming to be accepted, particularly among those whose studies require something approaching a technical meaning. In this more precise sense management is coming to mean the control of the process of executing a given policy and is to be clearly distinguished, as regards both the activities involved and the abilities required, from the formulation and determination of that policy, which is the task of the process known as administration. The two together constitute the control of the enterprise. In order that they may function a living structure is built by the process of organization, so that what is to be done and the persons to do it are grouped for the most efficient working. These three processes—administration, management and organization—are common to all corporate undertakings. They may assume different forms in different enterprises; they may be carried out indifferently or ably; each of those who perform them may participate in all three or concentrate on one alone.

The determination of this fundamental conception is slowly bringing about an understanding of the fact that although the enterprise of a church or school or hospital may be far removed in character from that of steel manufacturing and although both may be far removed from that of an army, all have similar basic principles of technique in their administration, organization and management. The study of these principles is perhaps one of the most modern phases of social scientific research; it cannot fail to bring the ideas of modern business management more into line with the principles which centuries of experience and study have proved valid for those far older forms of human association.

In every form of corporate human endeavor the infinitely developing complexity of modern civilization demands a higher ability in those

who control. As industry grew out of its earlier factory stages and the modern joint stock system of ownership matured, the owners of capital inevitably became more and more remote from the businesses they owned. The original proprietor-manager was replaced by hundreds, perhaps thousands, of shareholders drawn from all classes and often completely unacquainted with the concerns in which they were financially interested. This new system of ownership not only made industrial growth more rapid and extensive but also called into being as separate and distinct entities in the industrial structure the two newly recognizable activities of administration and management. Democratization of ownership led to specialization in control. The representation of capital in industry has therefore tended increasingly to be assumed by administration and management.

The sphere of management has become further enlarged as industrial operations have extended. Its practise is no longer merely a question of applying native intelligence and common sense; it demands in addition specialized knowledge and expert ability in many fields. Management has developed into a combination of techniques, which must be learned; and it is coming to be practised, like the older professions, on a basis of ascertained knowledge and established scientific practises. The developments which follow upon the growth of large businesses, the persistent stress of competition, the constant flow of inventions and improvements, the wide results of scientific research in many directions, the insistent necessity for better quality and lower costs and the urgent demand of the workers in industry for a higher standard of living and a more real share in industrial rewards have all contributed to render the task of management increasingly complex and responsible.

This enlargement of the sphere of management has come about partly through the growth in the size of industrial units and partly through the specialization made necessary by increased technicality. Whereas in the early stages of factory development the work of management was primarily concerned with the processes of production and even in that sphere was far from scientific, later growth has involved an ever widening field of management activity—the opening up of the new functions of research and planning in production, distribution and office routine and, equally, the development of the new industrial functions of comparison (involving

the close study and control of statistics in every branch of an enterprise) and advertising. Accounting has advanced from the quill-pen stage to the highly complex machine system. Calculation by guesswork has developed into the modern system of budgeting. Transport has become a highly specialized service. The supervision and guidance of labor and of working conditions have passed from the elementary stage to the technical in half a century. The study of machine and hand processes has been divided and subdivided, so that engineers, chemists, psychologists and research experts now find valuable occupation in work which an earlier age relegated to foremen and workers themselves.

In consequence of the specialization of management its organization, especially in larger enterprises, has become a major problem of administration. It is primarily a problem of co-ordination—of welding the many parts, each contributing to the execution of the governing policy, into one smoothly operating and effectively coordinated body. To this end administration is gradually perfecting its own technique, which involves a clear scheme for the determination and interpretation of policy and the checking of results, an orderly scheme for the budgetary control of all managerial activities, a well matured plan of corporate organization to insure the interlocking of every useful activity and, probably most important of all, a strong and ceaseless check upon the efficiency of the management personnel and the closest attention to its recruiting and conditions of work.

This essential specialization of management has in large measure determined the basic principle underlying the form of its organization, which must recognize the existence of these different techniques and permit each a full field for development. This principle of organization on the basis of functions—a grouping of activities, like with like—although sound as a single principle cannot in practise be taken as the sole principle. Experience has revealed what would equally have been revealed by wider study of organization through the ages and in other spheres: that the functional principle of organization needs tempering by other equally basic principles. It must be made to harmonize with the vital need for coordination in any enterprise; it must be regulated by the necessity of the centralization at various points in an organization of responsibility for results; it must be modified to insure the fullest possible contribution from all who constitute an organization. Yet it is true

that the basis of the form of modern organization most calculated to yield results is a functional basis, adapted to the needs of the particular enterprise and translated into practical shape in the light of other organizational principles.

One of the major germinating influences in the development of management has been the steady growth over the last half century of the use of scientific methods and the pressure from within and without to render the technique of management scientific in the same sense as other techniques. This objective became crystallized in the movement, generally known as scientific management (*q.v.*), which sprang from the original work of F. W. Taylor. This movement has emphasized the necessity for continuous research and experiment in every branch of management; it has promoted the establishment of standards of procedure, of methods and of results, based on the knowledge gained by research, and has built up a scheme of control based on these standards. These developments necessitated in those who perform the tasks of management a fundamental change in their approach to their work: guesswork must be replaced by systematized knowledge, a trust in fortune by a careful analysis of the problem in hand and a ready acceptance of tradition by unprejudiced research relentlessly pursued. In the work of management this movement has led to the rapid development of such activities as costing, time study, motion study, market research, production planning and budgetary control. It has interpreted into a philosophy the manifold changes inevitably and variously brought about in management and has given them character, form and purpose.

Despite the immense growth in the responsibility of management, the amazing extension of its activities and the ever deepening intensity and complexity of its work the preeminent factor in management remains the managerial personnel. The science of management, necessary as it is for the furtherance of managerial efficiency, remains ineffective except in so far as by the human art of managing it is fruitfully utilized. Scientific knowledge is an essential preliminary to the practise of an art, but the art itself calls for human skill, the human faculties whereby the science is effectively applied to particular circumstances. It is highly questionable whether enough thought and effort have yet been directed to providing all corporate enterprise with the highest possible caliber of managerial man power. In large measure the stand-

ard of man power can be raised by training, but it is only recently that organized educational work has been attempted on anything approaching an adequate scale. Equally, little has been done to lift out of the rut of the old empirical methods the immensely important task of selecting the managerial staff; and much yet remains to be done in the study of its working conditions, remuneration, status, system of promotion and direction. If there were devoted to these ends the same amount of thought and time that is devoted in most progressive concerns to the planning of new machinery or the lifting of an already high output, industrial efficiency and stability would be vastly increased. A committee set up by the Federated American Engineering Societies to study waste in industry estimated in 1921 that from 50 to 75 percent of the waste in certain lines of industry (boots and shoes, clothing, textiles, building trades, printing trades and metal trades) was attributable to shortcomings on the side of management and less than 25 percent to labor. It is in the direction of improving the man power of management that the greatest progress remains to be effected.

This is the case to an even greater extent in public institutions, national and civic government, educational organizations and the whole field of corporate activity. Society suffers setbacks and wastes as a result of this disproportion between the knowledge it possesses and the ability wisely and scientifically to apply that knowledge for the common weal. This disproportion is exemplified perhaps most clearly in the experience of Soviet Russia, which has abandoned private enterprise in economic life and has turned the state into a vast economic machine to function for the benefit of the masses but still finds itself dependent upon yet hindered by the state of efficiency of its managerial personnel. Within the broad lines of policy set by the leaders of the Communist party economic tasks and resources are allocated among the various individual trusts and plants. But the problem of execution rests with the managerial personnel within these, and it is their inability to perform their tasks which has to a considerable extent limited the progress of Soviet industry. It is to remedy this limitation that such liberal use has been made of foreign experts, who at once manage current production and train their successors from among the ranks of the Russian people.

In capitalist industry the scope of managerial discretion is limited by the requirement that

whatever is done must be profitable, in either the immediate or some more or less reasonable future. The touchstone of any managerial proposal must inevitably be its profitability. Since, as Veblen has so clearly indicated, business profits in modern industry may sometimes be obtained at the expense of industrial efficiency, it is not necessarily true that the most profitable managerial policies from the standpoint of the individual firm are the most desirable from the standpoint of social interest. In the increasing specialization of management, however, and in the consequent increasing infiltration into managerial personnel of technically trained persons whose prime interest and desire are production rather than profits, one may perhaps see a possible agency for a new industrial revolution and for a conversion of industry into an agency for social welfare rather than for individual profit. Other writers, such as Brookings and Means, viewing the function of management particularly from the standpoint of the separation of ownership from control, have emphasized the diffusion of ownership and the concentration of corporate control in the hands of the managerial personnel; they have discerned therein the transformation of management from a representative solely of capital, interested only in obtaining the largest possible profit for the shareholders, into guardians of the social welfare, managing industry so as to assure to the shareholders a fair return, to the laborers a just wage and to the consuming public reasonable value. As those who practise the profession of management in all its branches come to appreciate this social purpose in their work—the vital service to the community which both the exalted and the humble in their ranks are rendering; as this conception of their work as a social service comes to be accepted as a professional objective; and as one and all come to feel their common unity in that service and a common pride in the good exercise of their profession, so will the standard of that service be raised to the level which its vast responsibilities demand.

MANCHURIAN PROBLEM. The problem of Manchuria centers around the conflict between the expansive West on the one side and the newly self-assertive East on the other. In so far as it involves China, Japan and Russia, the three states bordering on Manchuria, it is only a regional problem; but by reason of its implications, though less direct, for the United States and in a different sense for the major European powers it becomes a world wide problem of war and peace. The stake for which rival powers contend is the profit of Manchuria's economic exploitation.

Until the closing years of the nineteenth century Manchuria was virtually unknown and unpopulated and wholly undeveloped. Juridically it was part of China, as the Manchu dynasty which had ruled China since the seventeenth century emanated from Manchuria. After the overthrow of the Manchu dynasty in 1912 the Three Eastern Provinces, as the Chinese called Manchuria—Fengtien, Kirin and Heilungkiang—occupied a status between full incorporation into China and dependency. In actuality, how-

ever, Manchuria had already become a pawn in world politics. Russia had long before started its glacial movement eastward and had advanced so far into Asia as to necessitate a delimitation of frontiers. The Treaty of Nerchinsk in 1689 had fixed the Amur River watershed as the line; and by negotiations in 1858 and 1860 Russia obtained from China, which had already been humbled in two wars with western powers, the rest of what is now Siberia.

In 1894 the Sino-Japanese War broke out, signaling Japan's advent into world affairs. Japan won and in the Treaty of Shimonoseki in 1895 forced China to cede the Liaotung Peninsula, the southeastern tip of Manchuria. Russia, supported by Germany and France, then intervened and compelled Japan to relinquish the peninsula. As reward for this assistance Russia in the following year exacted from China the right to build a railway from Chita across Manchuria to Vladivostok with a view to shortening the trans-Siberian route. The agreement also gave Russia the right to acquire lands on both sides of the line for access to necessary construction materials as well as the right to administer these lands, which was subsequently unilaterally construed by Russia as the right to station military police. China was empowered by the agreement to own shares in the railroad company and to participate in its management, but this power became nominal only. In 1898 the battle of the concessions began, with each great state pressing for its share of China. To Russia fell a leasehold on the Liaotung Peninsula and the right to construct a branch of the Chinese Eastern Railway—as the line built in pursuance of the 1896 agreement is known—from Harbin south to Dairen on the Liaotung coast. Russia had succeeded in closing a grip around Manchuria, but the Russo-Japanese War was foredoomed.

The war came in 1904 and was closed in 1905 by the Treaty of Portsmouth, whereby the Russian leasehold on the Liaotung Peninsula was ceded to Japan together with the part of the Chinese Eastern Railway running between Changchun and Dairen, now known as the South Manchuria Railway, and all Russian rights connected therewith. It was further provided that both countries were to maintain a limited railway guard along their respective portions of the line. In December, 1905, China and Japan signed an agreement confirming the transfer and in a supplementary agreement Japan bound itself to withdraw its railway guard if and when

Russia did so. Russia did withdraw its troops on China's demand after the Bolshevik revolution but Japan has not done so to date. It is contended by Japan that China in a secret agreement concluded at the same time engaged not to construct any railways parallel to the South Manchuria Railway, but China denies the existence of such an agreement. China has subsequently constructed such lines, while Japan has protested against them; and this is the basis for some of the sharpest controversies between the two countries.

The original concession of the Liaotung Peninsula leasehold was for twenty-five years, expiring in 1923; the Chinese Eastern Railway was ceded for eighty years from date of completion, or until 1983, with a provision that China might recover the road by purchase in 1939. In 1915, however, Japan presented an ultimatum to China, forcing the latter to sign a treaty based on the so-called Twenty-one Demands, whereby the leasehold on the Liaotung Peninsula was extended to 1997 and the concession for the South Manchuria Railway to 2002. The right of repurchase in 1939 was revoked. China has since contended that this treaty, being extorted by *force majeure* and without *quid pro quo*, is invalid and that Japan's continued presence in Dairen, Port Arthur and environs is an act of trespass. It is a contention that Japan of course has not even recognized. This is the fundamental issue between the two countries and it is an irreconcilable difference. All other disputes in Manchuria as to the status of Japanese citizens, the right to purchase land and similar questions are corollary thereto.

Manchuria might have remained deadlocked by conflicting juridical claims had there not supervened the force which has changed all far eastern relations. This was Chinese nationalism. China set out to recover its alienated territory and sovereign rights. In south Manchuria it entered upon a railway building program with the object of laying down a system which would drain off Manchurian products via Chinese railways to Chinese ports instead of via the South Manchurian system to Dairen, the Japanese port. Simultaneously it sought by establishing banks, factories, mills and trading concerns to break Japan's economic monopoly. In north Manchuria it encroached steadily if indirectly on Russia's position. China had been on bad terms with Soviet Russia since the repudiation of the informal alliance in 1927 and the severance of diplomatic relations between the two

countries. There were numerous incidents and in 1929 China resorted to direct action. It seized the Chinese Eastern Railway, arrested a number of Russian employees of the line and deported several higher officials, including the general manager. Russia dispatched a military expedition into Manchuria and after inflicting a sharp defeat on Chinese troops compelled China to restore the status quo ante.

Between China and Japan ill feeling is of longer standing and incidents have been even more numerous. China steadily became more exigent and the military party in Japan more outspoken in demanding a "strong policy," by which it meant military punitive measures. A succession of minor clashes in 1931 precipitated the crisis. On September 18 the Japanese occupied Mukden, disarmed the Chinese police and took over the civil administrative machinery. One center after another was similarly occupied and before the end of the year practically all of Manchuria was under Japanese domination, including parts of what had been the Russian sphere. After an interval in which local governments were set up under the aegis of Japan, on February 18, 1932, the independence of Manchuria and Inner Mongolia was proclaimed and a new state set up under the name of, at first, Ankuo, later, Manchukuo, with subsequent *de jure* recognition by Japan. On March 9 Pu Yi, who had been deposed as emperor of China in infancy, was brought by the Japanese to Changchun and installed as dictator. At the same time all important branches of the new government were put under the supervision of Japanese officials. In short, Manchuria had become a Japanese possession but not without challenge. First, Chinese military units have continued a guerrilla campaign. Second, Soviet Russia frightened by Japanese encroachments brought up reinforcements and strongly fortified its borders. Third, the Occident intervened through the League of Nations and the United States.

Fundamentally there are two conflicts in Manchuria. One is between China and all other powers. China holds Manchuria to be its territory in law and wishes to make it so in fact. The issue then is between Chinese nationalism and the expansionist ambitions of other powers. The other conflict is among the great powers for the right to exclusive domination over Manchuria. By reason of propinquity, momentum and the urgency of necessity Japan is the most vigorous claimant. The necessity is, first, that of self-defense. Manchuria in the hands of some other

great power, as was threatened in the time of the imperialistic raids on China, would constitute a menace to Japan's continued existence as an independent nation. Early in the twentieth century the aggressive ambition of czarist Russia was the source of fear. Now Soviet Russia with the propulsive force of a revolutionary mission is again the source. Second, there is economic need. Japan is notoriously wanting in raw materials, especially those necessary to rapid industrialization. Manchuria is rich in raw materials, especially coal, and has considerable deposits of iron and minerals. It has vast uncut timberlands and in potentiality of agricultural development is comparable with the American northwest. Furthermore it is the world's principal source of the soya bean, of which over 200,000,000 bushels are now produced annually. Japan, being overpopulated, deficient in raw materials and food supply and committed to industrialism, must have access to raw materials, a market for its finished products and an outlet for the investment of surplus capital. All of these Manchuria offers. Its foreign trade in 1929 amounted to more than \$500,000,000, of which Japan had more than two fifths. Japan's investments there are estimated at more than \$1,000,000,000. The country is still sparsely populated, with some 30,000,000 inhabiting an estimated area of 450,000 square miles, including Jehol. But the pressure of population in China has been pushing between half a million and a million emigrants over the northern borders into Manchuria every year, and with peace in Manchuria this movement would advance rather than recede. The prospect is that in a measurable period Manchuria will be more heavily populated.

To Japan then Manchuria represents a huge vested interest and an economic outlet. Abstractly there is no reason why all Japan's needs from Manchuria could not be fulfilled without actual control. It could buy raw materials from Manchuria and sell its finished products there in the open market, having the advantage of propinquity over other foreign competitors. In actuality there are two reasons why Japan will not rely on the working of natural law. The first is precedent. Since Japan emerged into the modern world it has been the law of power politics that strong nations desiring access to the advantages of a rich, weak and undeveloped land will seize it if they can in order to enjoy a monopoly; therefore access to the benefits of such a land can be assured only by exclusive possession. This law has been in full operation

in the Far East and Japan refuses to believe that it has been abrogated; the evidence of a new spirit in international relations since the World War is not conclusive. Japan assumes instead that since China is not strong enough to hold Manchuria, some other power will take it unless Japan does.

The second reason rests on conditions in China. The first of these conditions is Chinese nationalism, which is economic no less than political. China aspires to the profits from Manchurian development for itself. China's railway program in Manchuria is evidence; even before hostilities broke out in Mukden in 1931 there had been a sharp diplomatic struggle over railways, and in large part the hostilities were precipitated by this struggle. While the rush of Chinese immigration into Manchuria offers promise as a market it tends also to fix a new economic polarization and to draw Manchuria into China's economic orbit. The population of Manchuria by Chinese would work to Japan's advantage if the Chinese remained passive and in a state of willing tutelage. But they will not so remain in either China proper or Manchuria; they are competing similarly in the foreign trading centers on the Chinese coast, in Shanghai, Hankow and Tientsin, and there too to the foreigner's disadvantage. The second Chinese condition affecting Japan's attitude is the breakdown of the traditional processes of government in China, as reflected in civil wars, banditry, maladministration and corruption, which although they may be inescapable in a period of societal transformation obstruct the channels of trade. To permit Manchuria to become an integral part of China would subject it to the same condition, whereas even under indirect Japanese hegemony it has been exempt.

The Manchurian problem is not only regional in scope. Soviet Russia is involved because it abuts on Manchuria and because of its interest in the Chinese Eastern Railway and the north Manchurian cities which the railway serves economically. After the Russo-Japanese War the two countries came to an understanding based on non-interference in each other's spheres. Until 1931 this was adhered to except in the abnormal years of the World War, and relations between them were undisturbed. Russia's mobilization on the Siberian border in 1932 was notification that non-interference remains a condition of peaceful relations. The interest of the western powers, notably the United States, has been to keep Manchuria a free field for economic

competition. To this end the United States has actively opposed every effort to detach Manchuria from China and has never conceded that Manchuria was exempted from the open door doctrine, the principle of equality of opportunity for all trading nations, laid down for China by John Hay. In 1915 after the Twenty-one Demands the United States sent identical notes to China and Japan asserting that it would recognize no treaty impairing the rights of the United States in China, the political or territorial integrity of China or the open door policy. The Nine-Power Treaty concluded in Washington in 1922 again bound the signatories, the nations having interests in the Far East, to respect the sovereignty and integrity of China and to confer "whenever a situation arises which in the opinion of any one of them involves the application of the stipulations of the present treaty." The issue could be evaded until 1932, because no occasion arose to test the question whether Manchuria was a part of China. In 1932 the issue could no longer be evaded. Intervention by the League of Nations and protest by the United States having proved unavailing to arrest Japan's advance throughout Manchuria, the United States on January 7, 1932, sent a note to China and Japan to the same effect as the one of 1915 but adding "that it does not intend to recognize any situation, treaty or agreement which may be brought about by means contrary to the covenants or obligations of the Pact of Paris of August 27, 1928." The Assembly of the League of Nations in resolutions passed March 11, 1932, took a similar stand, although less unequivocally. On this issue there can be no technical evasions. The western powers refuse to recognize the legality of Japan's authority outside the Liaotung Peninsula and the South Manchuria Railway zone or the existence of the so-called Manchukuo. Japan steadfastly refuses, as it always has refused since 1905, to recognize the right of any third power to interfere on the question of Manchuria. While conceding Chinese sovereignty, at least until the setting up of Manchukuo, it holds Manchuria to occupy a separate status by virtue of the treaties of 1905 and 1915.

In December, 1931, the League of Nations decided to appoint an international commission to conduct a first hand investigation in Manchuria. The commission, headed by Lord Lytton, published its findings in October, 1932. It decided against restoration of the status quo ante September, 1931, and against the maintenance

and recognition of Manchukuo; it recommended the autonomy of the Manchurian provinces under Chinese sovereignty, but with regard to Japan's peculiar interests, and the institution for this purpose of a special administrative regime for the provinces. It therefore advised the Council of the League to invite the Chinese and Japanese governments to convoke a joint advisory conference to draft treaties embodying the principles and methods of operation of the new regime.

Certain terms of reference were laid down for the guidance of this conference: internal order was to be maintained by a special gendarmery organized and maintained with the aid of foreign advisers; all other troops were to be withdrawn; Japan was to be given the right of free participation in but not control of the economic development of Manchuria; the right of foreigners to settle and lease land was to be extended throughout Manchuria but with modifications of the right of extraterritoriality; a new agreement was to be drawn up for the operation of the railways in Manchuria, preferably on a basis of amalgamation of Chinese and Japanese lines, otherwise on a basis of joint operation under a Sino-Japanese commission with the assistance of a foreign adviser. To these proposals, however, Japan refused to give consideration and reiterated its determination to stand by its recognition of Manchukuo as an independent state.

MANCINI, PASQUALE STANISLAO (1817-88), Italian jurist and statesman. Mancini was born in Campania and studied law at the University of Naples. He soon acquired a great reputation as a jurist and professor of law. In the famous letters which he exchanged in 1841 with Mamiani he discussed the foundations of jurisprudence and especially penal jurisprudence, maintaining that moral justice must be combined with social utility and that the purpose of punishment is not only expiation but also prevention of crime. As deputy to the Neapolitan parliament Mancini composed on May 15, 1848, the solemn protest of the chamber against its dissolution by the Bourbon monarch and was forced to flee to Turin, where he soon became the most famous of the southern exiles, an outstanding lawyer and a professor of international law in the University of Turin, occupying a chair created especially for him. In his inaugural lecture on January 22, 1851, *Della nazionalità come fondamento del diritto delle genti*, he sought the vital principle of nationhood not in historical and natural factors, such as language, race and territory, but in the "consciousness of nationality." In advocating respect for every other nationality Mancini aimed to distinguish his theory of nationalities from imperialistic nationalism. The Italian school founded by Mancini applied the principle of nationality even to private international law, and its views were adopted in juridical form by the Italian Civil Code (1866), which regulates personal matters, family relations and the inheritance of aliens by the principle of national law rather than by that of domicile.

With Bluntschli and others Mancini was one of the founders of the Institute of International Law (1872) and became its president in 1873. In his political career Mancini was general secretary for justice at Naples in 1861, in 1862 minister of public instruction of the new King-

dom of Italy, from 1876 to 1878 minister of justice and from 1881 to 1885 minister of foreign affairs. He displayed great political and particularly legislative activity, combating capital punishment and the Jesuits, championing the abolition of imprisonment for debt and taking a great share in drawing up the new code of commercial law. As foreign minister he signed (May 20, 1882) the treaty of the Triple Alliance, which remained in force until the World War. Although he defended this treaty for political reasons he refused to join Austria and Germany in their demand for an internal reactionary policy, and he declared that Italy could never have considered the Triple Alliance as directed against England.

MANDAMUS is one of the "extraordinary" common law remedies, also designated prerogative writs, by which public administration is subjected to judicial control. As the name implies, it is a command, issuing from the sovereign to a subordinate jurisdiction, requiring the performance of a legal duty. Mandamus is defined by Blackstone as a command issuing in the king's name from the court of King's Bench and directed to any person, corporation or inferior court of judicature in the king's dominions, requiring the performance of some particular thing which appertains to an office and duty (*Commentaries*, III, 110). Mandamus was formerly used in the main to determine controversies regarding corporate acts or corporate or ecclesiastical office, while at the present time its principal use is in connection with acts or omissions of public officials. Originally, after the petition for the writ had been granted, the matter lay between the sovereign (acting in England through the court of King's Bench) and the subordinate, whose return to the writ, showing either com-

pliance or reason for non-compliance, was accepted as true, a practise that is similar in some respects to that which obtains in contempt proceedings at the present day. In course of time the person who had secured the writ (the relator) was permitted to question the truth of the return but only by a separate action against the respondent, and this is still the law in a few American states; but the logical development was to consolidate the mandamus proceeding with the action for the false return, and this was done in England, first, with limited application, by the statute of 9 Anne [c. 20 (1710)], then, generally, by the statute 1 Wm. IV [c. 21, sect. 3 (1831)]. In most states of the United States (frequently under statutory regulation) the pleadings in mandamus are in substance or also in form assimilated to other civil actions, leading to an issue of law or of fact upon which the right to relief is determined.

Mandamus is still available in the United States to enforce members' rights in corporations; this, however, constitutes a very minor and subordinate part of its function. Its chief use at present is to compel official action in accordance with law, where the public or a private interest demands such action. If a public interest is involved, the states are divided on the question whether proceedings may be instituted only by the attorney general or other public law officer or also by a private individual; if the official action is required only in the private interest, it is the aggrieved party who sets the proceeding in motion. Mandamus is thus the appropriate remedy where a license, consent or permit is withheld by an officer from a private party who has a right to it; in such a case adequate relief would be afforded neither by the possible liability of the officer to be removed from office by a superior for official misconduct nor by a possible cause of action against the officer for damages.

It is commonly said that only those official duties which are ministerial in character may be enforced by mandamus, and the term ministerial is then contrasted with the terms executive and discretionary. A distinction between ministerial and executive duty can be maintained only if the term executive is employed to refer either to the chief executive or to an official function the essence of which is the guidance or direction of a complex administrative course affected by varying circumstances. No mandamus has ever been applied for against the president of the United States. Occasionally the writ has been issued

against a state governor, particularly where he was ex officio member of an official board, and probably in most of these cases the governor acquiesced in the proceeding since it afforded the readiest means of judicial determination of a controversial point of law. In the case of a resisting governor the proceeding encounters the difficulty that the chief executive is not, in relation to the courts, a subordinate officer and that the court has no power to enforce the writ against him by contempt process, which he might nullify by the exercise of his pardoning power. The question, however, is somewhat academic.

Where the function is executive in the sense that it consists in the direction of a complex administrative course, the mandamus can at most require the bringing about of a result, and the impossibility of specifying steps to be taken will render it difficult to treat failure to bring about the required result as disobedience to the judicial mandate; judicial control might thus come to mean that the court instead of commanding the officer would have to substitute itself in his place and assume administrative direction. In Illinois it was thus held that mandamus was not available to compel the mayor of Chicago to close liquor saloons on Sundays in compliance with the law of the state [*People v. Dunne*, 219 Ill. 346 (1906)]. While a number of official functions are plainly of this character, there will be considerable doubt as to others: can a court compel the institution of a criminal proceeding or a fair and equal assessment of property for taxing purposes, or do these functions elude judicial enforceability? Courts will differ greatly on the question of practicability; the Supreme Court of the United States held mandamus inappropriate to force the directors of a railroad company to establish a station [*Northern Pacific Ry. Co. v. Washington*, 142 U. S. 492 (1892)]; and it was the impracticability of judicial control that led to the legislation introducing administrative commissions for the control of public utilities.

In the case of *Decatur v. Paulding* [39 U. S. 497 (1840)] the Supreme Court held that the secretary of the navy cannot be compelled to allow a pension claim, but two years before it had been held that the postmaster general could be mandamusd to comply with an award of the solicitor of the Treasury, to whose decision Congress had submitted a claim under a contract with the Post Office Department [*Kendall v. United States*, 37 U. S. 524 (1838)]. The postmaster's duty was treated as ministerial, while the allowance of the pension claim was treated

as discretionary, since it involved a controverted interpretation of a statute. If *Decatur v. Paulding*, which is considered a leading case, were to be understood as meaning that the necessity of interpreting a statute renders an official function discretionary, half the value of the remedy of mandamus would be lost, as subsequently recognized by the Supreme Court [*Roberts v. United States*, 176 U. S. 221 (1899)]. In only a few cases may it be assumed that it is the legislative intent that an administrative decision on a point of law should be final (pensions, public lands, possibly the classification of mail or of places in the civil service), and finality then means judicial non-interference, whether by mandamus or otherwise; but it can only be misleading to identify interpretation of a statute with discretion.

There are administrative functions which are discretionary in the sense that the official decision is left to be reached in accordance with the official's sense of wisdom, expediency or fitness. For a court to dictate the decision in such a case would be to usurp the administrative function; and this accounts for the principle that mandamus will not control administrative discretion. Administrative law, operating through mandamus, is greatly concerned with the problem of discretion. An unqualified discretion is rarely vested in officials exercising authority over private rights. Although the official may be free to decide one way or another, it is his clear duty to consider the case and to proceed to some decision, to decide fairly and without favor and to confine his discretion to legitimate considerations but to take into account all those that are legitimate. Without his discretion being touched he may be judicially controlled in all these respects. More than that: if discretion is based on a variety of factual considerations, it is reduced in so far as facts are undisputed, and skilful pleading may compel the official to admit or deny relevant facts; he must then be equally alert to bring out some decisional factor, which, since it is not bound up with definite provable facts, constitutes the irreducible minimum of his discretion. An apparent discretion may thus be resolved into lack of discretion; but a true discretion will defy analysis. Mandamus is thus the touchstone of administrative discretion.

The First Congress of the United States attempted to give the Supreme Court original jurisdiction in mandamus cases; but the court held in the famous case of *Marbury v. Madison* [5 U. S. 137 (1803)] that this could not be done,

since the original jurisdiction of the Supreme Court was exhaustively defined by the constitution. The federal judiciary acts have withheld from the circuit and district courts the power to issue mandamus except in so far as the power may be necessary to the exercise of a jurisdiction otherwise possessed (as, for example, mandamus to a city council to levy taxes to satisfy a judgment recovered against the city in the federal court). By a historical accident, however, mandamus may be issued by the Supreme Court of the District of Columbia and is thus available against the heads of departments and bureaus whose seat of office is in Washington. That a local court should be the only one vested with this prerogative jurisdiction may appear as an anomaly; but Congress has acquiesced in this condition, led perhaps by consideration of the advantages resulting from concentration of the remedy of mandamus at the center of government, where are located the heads of departments, chiefs of bureaus, and commissions, who possess the most important determinative powers in the federal administration. If the lack of power of the district courts to issue mandamus has not been felt to be a serious handicap to justice, it is also because injunction may be made to serve the same purpose—restraining a postmaster from obeying an order of the postmaster general not to deliver instead of mandamus to him to deliver, as in *American School of Magnetic Healing v. McAnnulty* [187 U. S. 94 (1902)]. It is true that the courts may be inclined to treat functions vested in high officials as beyond judicial control on the ground that they are discretionary, and *Decatur v. Paulding*, above cited, may serve as a convenient precedent in this respect. The consent powers of the Interstate Commerce Commission under the Transportation Act of 1920 have so far been almost immune from control by mandamus; but with the growth of federal administrative powers over persons and property the use of the remedy is apt to become more rather than less frequent.

In the states mandamus belongs historically to the jurisdiction of the highest common law courts of original jurisdiction; by constitutional provision the power to issue it is also often given to the highest court; local courts (county courts and so on) do not issue it just as they ordinarily do not grant injunctions. In many states the cause is still entitled in the name of the people or the state on the relation of some individual against the defendant; in others the real party is the plaintiff. Some states still observe the

practise of a petition for and grant of a writ, either "peremptory" or "alternative" according to whether the issue is one of law only or also one of fact; in others the proceedings, including the pleadings, are assimilated to other civil actions. The trial of the fact is in some states by the court, in others by a jury; since the administrative function is ministerial, there is an entirely independent finding of facts by the court. Where there has to be a petition for the writ, there still exists a remnant of the doctrine that its grant rests in the sound discretion of the court, which may be governed by considerations of public policy; but the exercise of this discretion is reviewable by the appellate court. If a mandamus is issued, disobedience to it may be dealt with as contempt of court. The recalcitrant official also exposes himself to an action for damages; this liability may become important if a political issue is made between the executive and the judiciary, for the chief executive may shield the official from contempt process by the exercise of the pardoning power, but he cannot protect him from a judgment for damages.

In England at the present time mandamus is a relatively uncommon remedy. The Civil Judicial Statistics for England and Wales show for 1928 ten applications for the writ and the rule made absolute in eight cases and for 1929 twelve applications for the writ and the rule made absolute in two and discharged in nine cases. The slight recourse to mandamus may perhaps be accounted for by the common availability of explicit statutory remedies where private rights depend upon official action; and in some cases declaratory relief may be an adequate substitute for mandamus.

MANDATES. Mandatum was a term of Roman law designating a gratuitous agency. The word mandate is used in civil law countries today with the same significance and has even been incorporated into the common law, but with the more restricted significance of a gratuitous bailment [*Cox v. Bernard* (1763), 2 LD. Raym. 909]. In international relations the term has been employed in cases such as the Lebanon (1860), Samoa (1887), Crete (1898), Manchuria (1905), Morocco (1906), where a group of states has designated an individual or a state to administer territory. The mandates system as a recognized institution of international law, however, originated in article 22 of the League of Nations Covenant. It may be defined as a system for the administration of certain backward territories by advanced states which act as mandatories on behalf of the League of Nations according to the terms of a trust, embodied in the Covenant and the mandate, which provides for the tutelage of the inhabitants until they are able to stand by themselves.

This system represents the compromises arrived at by the Allied and Associated Powers in reference to the disposition of the extra European enemy territories which they had occupied during the World War. Annexation of these territories was barred by the public pronouncements of war aims on the part of allied leaders, and restoration to the enemy state was equally barred by such pronouncements, which had denounced German and Turkish colonial ad-

ministration. Direct international administration had not proved a success in such cases as Samoa and the New Hebrides. Most of the territories were in no condition to be recognized as independent, while the most advanced of them had been made the subject of secret treaties among the Allies, which divided them into spheres of interest. Thus the adroit proposal of General Jan Smuts, developed by him from suggestions of the British Round Table group and published shortly before the opening of the peace conference, was seized upon as a way out. This proposal offered a measure of satisfaction to the allied occupants desiring annexation, because they could be made mandatories of the territories they coveted; and it would also please the idealists, because supervision by the League was to be assured. The native inhabitants might gain consolation by the pledge of eventual self-determination. Even the Central Powers would find the system more palatable than outright annexation by their enemies.

Although the formulation of this plan was a work of practical statesmanship reconciling conflicts of the moment, the basic ideas of the compromise had been developing through a period of over three centuries in the experience of the people of European origin with the "backward peoples" of America, Asia and Africa. The humane ideas of Queen Isabella, Bartolome de las Casas and Francis de Victoria concerning the treatment of the Indians of New Spain had been so widely circulated by the antislavery and humanitarian movements in England, the United States and France in the late eighteenth and the early nineteenth century that all colonial powers eventually found it convenient to explain their mission as a trust for the benefit of the natives or for the good of the world. International conferences, such as that at Berlin in 1885 and at Brussels in 1890, gave more concrete form to the duties of this trust with reference to central Africa, and the United States upon entering the colonial field after the war with Spain insisted that the Philippines were "an unsought trust which should be unselfishly discharged . . ." (President McKinley's message, December 3, 1900).

After the welfare of the inhabitants of dependencies had been admitted as an object of colonial activity, it was impossible to ignore the aspiration of such people for independence, especially as nationalism spread. The eventual self-determination of colonies was viewed with equanimity by nearly all British statesmen in the

mid-nineteenth century, and although the renewed imperialism of the 1870's temporarily curbed the idea, it was again emphasized when the United States in acquiring oversea colonies reiterated the ideas of the Northwest Ordinance of 1787 for the government of contiguous colonies. The Senate resolution of February 14, 1899, which secured enough votes to ratify the peace treaty with Spain annexing the Philippines, asserted that American rule should "prepare them for local self-government . . ." In the Jones Act of 1916 Congress asserted that "it is, as it has always been, the purpose of the people of the United States to withdraw their sovereignty over the Philippine Islands and to recognize their independence as soon as a stable government can be established therein . . ."

The obvious inconsistencies in the application of these humane theories as well as the growing interest of all states in an open door for trade and investment in colonial areas had long suggested the need for international supervision over these imperial trustees and guardians. The idea was notably expressed in President Roosevelt's proposal in 1906 for a "mandatory of all the powers" to govern Morocco. The emphasis given to international control in the numerous plans for a League of Nations during the World War included such control of colonial administration, particularly in the memorandum of January 1, 1918, presented by George Louis Beer; this memorandum proposed that "backward regions are entrusted by international mandate to one state." The form of such safeguards was elaborated by the British Round Table group and by General Smuts in December, 1918, and a definite plan for such control was embodied in the resolution of the Council of Ten, drafted by General Smuts himself on January 30, 1919. This was utilized with only slight modification as article 22 of the League of Nations Covenant. By the Treaty of Versailles (art. 119) "Germany renounced all her rights and titles over her overseas possessions in favor of the Allied and Associated Powers," which thus became burdened with the function of selecting mandatories and proposing the terms of the mandates. Turkey relinquished by the Treaty of Lausanne (1923) all claims to her territories to be placed under mandate with the exception of the Mosul area of Iraq, which was left to subsequent determination. In fact the principal powers had proceeded to assignment of these mandates before the Treaty of Lausanne was concluded.

TERRITORIES UNDER MANDATE, 1928

| TERRITORY | CLASS | MANDATORY | AREA (in square miles) | POPULATION (1926) |
|---|-------|---|------------------------------|----------------------|
| Iraq | A | Great Britain | 116,511 | 2,849,282* |

Source: Wright, Q., *Mandates under the League of Nations* (Chicago 1930) p. 629.

The position of the mandatory state resembles that of a trustee rather than that of a proprietor, in that its administration is not for its own advantage but for the benefit of the inhabitants of the mandated areas and the members of the League of Nations. Thus the Council of the League, advised by the Permanent Mandates Commission, has meticulously examined the accounts of mandated territories to see that public income derived from the territory is expended for the benefit of the territory and not utilized for the mandatory's own purposes. Furthermore the mandatory is not entitled to utilize the mandated territory for military recruiting, although because of Clemenceau's insistence native troops from French Togoland and the Cameroons may be used in case of general war for the defense not only of the mandated territory but of outside territories of the mandatory power. Moreover the mandatory is not to gain advantage in trade or investments for its nationals in the mandated areas, except in class C mandates, but is obliged to maintain an open door to all members of the League and, in pursuance of treaties subsequently concluded, to the United States as well.

The position of the mandatory state resembles

that of a tutor, or guardian, since it is obliged to administer the most backward of these areas so as to protect the natives from such abuses as the slave trade, the arms traffic and the liquor traffic and since eventual self-determination is the goal for all of the mandated areas. The Covenant makes it clear that the mandates system applies only to territories "which are inhabited by peoples not yet able to stand by themselves," that such peoples are under "tutelage," or guardianship, and that the character of the mandate must differ "according to the stage of development of the people" and other conditions. It suggests three distinctive types of territory, which have been designated A, B and C mandated areas.

In regard to the A areas the Covenant states that "certain communities formerly belonging to the Turkish Empire have reached a stage of development where their existence as independent nations can be provisionally recognized subject to the rendering of administrative advice and assistance by a mandatory until such time as they are able to stand alone. The wishes of these communities must be a principal consideration in the selection of the mandatory." These communities were organized under three mandates,

Iraq, Syria and Palestine. In the case of Iraq the mandate was in the form of a resolution of the Council, which accepted the terms of the "treaty of alliance" between Great Britain and Iraq together with certain undertakings by Great Britain in connection therewith, as giving effect to article 22.

The British government announced on November 4, 1929, that it proposed to "recommend Iraq for admission to membership of the League of Nations in 1932," thus terminating the mandate and completing the self-determination of that state. This gave the Council an opportunity to define the conditions which justify the presumption that a mandated territory is ready for independence. The Permanent Mandates Commission found that these conditions had been met by Iraq and on October 3, 1932, by vote of the Assembly, Iraq was admitted to the League. According to a resolution of the Council, this terminated the British mandate from that date. France announced at a meeting of the Permanent Mandates Commission in 1931 that "the present progress of evolution points to the termination of the mandate for Syria and the Lebanon at a not very distant date."

Although Palestine is in some respects the most advanced of the areas, there is no immediate prospect of the termination of the mandate, because of the incorporation of the provision for a national home for the Jewish people. This proposal, put forward by Great Britain in the Balfour Declaration of November 2, 1917, and subsequently accepted by most of the Allied Powers, including the United States, contemplates free access to Palestine for Jewish immigrants. It is, however, somewhat difficult to reconcile with the "provisional recognition" of Palestine as an independent nation in view of the vigorous opposition of the Arabs, who constitute three fourths of the population of Palestine. This circumstance has prevented the development of a legislative body for Palestine, since such a body if representative of the population would be dominated by Arabs, who would frustrate the Zionist program.

The B mandated territories are described by the Covenant as "other peoples, especially those of Central Africa, [who] are at such a stage that the mandatory must be responsible for the administration of the territory under conditions which will guarantee freedom of conscience and religion, subject only to the maintenance of public order and morals, the prohibition of abuses such as the slave trade, the arms traffic

and the liquor traffic, and the prevention of the establishment of fortifications or military and naval bases and of military training of the natives for other than police purposes and the defense of territory, and will also secure equal opportunities for the trade and commerce of other members of the League." There has been no talk of immediate self-determination for any of these peoples, although the League has favored indirect administration which will educate the natives in self-government and has hesitated to approve federation of Tanganyika with neighboring British colonies in east Africa.

The territories under C mandate are described in the Covenant as follows: "There are territories, such as Southwest Africa and certain of the south Pacific Islands, which, owing to the sparseness of their population or their small size, or their remoteness from the centers of civilization or their geographical contiguity to the territory of the Mandatory, and other circumstances, can be best administered under the laws of the Mandatory as integral portions of its territory, subject to the safeguards above mentioned in the interests of the indigenous population." The fact that these areas are to be administered "as integral portions of [the mandatory's] territory" and that the open door does not apply on the theory that it is not a safeguard "in the interests of the indigenous population" (a reservation made on the insistence of the British dominions) suggests that the day of their self-determination is remote.

Japan although benefiting by these provisions with respect to her mandated islands of the north Pacific made a reservation against the exclusion of the open door requirement in these areas, and the United States has declined to negotiate treaties recognizing the mandates of the British dominions unless they will apply the open door provision.

The Permanent Mandates Commission, about which the League's supervision centers, has eleven members selected by the Council for their "personal merit and competence," the majority from non-mandatory states. The Commission meets at least twice a year, on which occasions it considers the annual reports of the mandatories and cross questions their accredited representatives, who have often been high officials from those areas. The Commission also deals with any petitions that may be presented (through the mandatory) by the inhabitants of mandated territory or (on behalf of those inhabitants) from other quarters. Its recommendations are sub-

mitted to the Council, which usually approves them without modification. The mandatory powers not represented on the Council are entitled to send ad hoc representatives during the consideration of mandates questions by the Council; acceptance of the Council's resolutions on the subject therefore involves acceptance by all the mandatory powers, which thus become bound by the resolution. The Council's resolutions often include general questions concerning mandatory law, policy or procedure as well as recommendations relating to a particular mandated area.

The sanctions of the system, like those of all international law, are primarily the good faith of the nations and the pressure of public opinion; but because of the regularity of supervision, the extensive publicity and the facilities for determining obligations with precision these sanctions are more effective than in some other fields of international law.

Although the Assembly has less responsibility with respect to mandates than does the Council, one of its committees reviews the working of the system and the Assembly regularly discusses the problem at its annual meetings and passes resolutions usually supporting the system against possible encroachment by the mandatories. A section of the League Secretariat devotes itself to mandate problems and keeps the members of the Commission supplied with various sources of information about the areas and the reactions of public opinion toward the system.

Each of the mandates provides that the mandatory must submit to the Permanent Court of International Justice on application of any member of the League any questions relating to the interpretation or application of the mandate.

The Permanent Mandates Commission has felt that its powers were not always adequate to secure the information it needed in its work, but the suggestions that the Commission might be authorized to visit any of the areas, grant an oral hearing to petitioners or greatly elaborate the questionnaire to be answered by the mandatory in its annual report have not been favored by the Council. In practise, however, the Council has sent commissions to both Iraq and Palestine; members of the Permanent Mandates Commission have listened unofficially to the grievances of petitioners, notably on the occasion of the special session at Rome in 1926 in regard to Syria; and the Commission has felt no restriction in the questioning of accredited representatives. The system relies mainly on these practical

devices for assuring information about the areas, publicity and contacts between the administrations and the League authorities. It does constitute probably the most thoroughgoing international supervision of national territorial administration yet devised.

The extent of legal authority of the League over the mandatory is not, however, precisely defined. The Permanent Mandates Commission and the Council have both stated unequivocally that the mandatory is not sovereign of the mandated territory, and this position has been accepted by the mandatories. It has not been decided, however, who is sovereign and the opinions of jurists differ. The League of Nations, the Principal Allied and Associated Powers, the mandated communities themselves and even the mandatories or some combinations of these have all been named as sovereign by different writers; and others have suggested that sovereignty is suspended in the territories for the time being. It seems clear that the Council of the League has authority to remove a mandatory and appoint a new one after a definite breach of the mandate, which presumably only the Permanent Court of International Justice can declare to have occurred. It also appears that the Council decides upon the conditions which justify a mandatory in terminating its mandate on the ground that the community is ripe for independence. Furthermore the Assembly may by a two-thirds vote admit a mandated community to the League and thereby determine that for League purposes the community is "fully self-governing" and therefore no longer subject to mandate. Article 22, like other articles of the Covenant, is subject to amendment by a majority of the members of the League, including all the members of the Council; and thus by a similar process it could be modified or terminated. It seems to be accepted by the Permanent Mandates Commission that the Principal Allied and Associated Powers, in whose favor the territory was originally renounced by the peace treaties and who made the original assignment of mandates, passed out of the picture upon the performance of that function. These considerations suggest that sovereignty of the areas is vested in the League, acting through the Covenant amending process, and is exercised by the mandatory with the consent of the Council for eventual transfer to the mandated communities themselves. This uncertainty of interpretation arises primarily from the fact that article 22 was not carefully drawn by experts but was inserted in the Covenant by

the Council of the Ten, which was actuated largely by political considerations.

The importance of the mandates system lies in its claim to provide methods more adequate than those previously employed for adjusting the relations of the highly industrialized capital exporting communities which have called themselves advanced and of the agricultural capital importing communities which have been called backward. As the quantity of backward territory remaining in the world has declined and the demand for new markets and sources of raw materials by the advanced countries has increased, the methods used for exploiting these areas have become more dangerous to the natives and the rivalries of the advanced states have become a menace to peace. Furthermore with the development of communications, national consciousness and methods of passive resistance among the backward peoples the problem of maintaining order and control in these areas by colonial administration based on military force has become more difficult. The mandate system claims to be an advance in that it subordinates the political and economic interests of the administration to the interests of the inhabitants of the area and of the world as a whole, in that it provides a mass of authoritative data for comparison of administrative methods and for the development of adequate standards of administration and in that it assures continuous disinterested international supervision and publicity, thus minimizing the probability of abuse of power by the administering state.

It is difficult to generalize upon the success of the system in the ten-year period of difficult readjustment in which it has been functioning. Serious disturbances have occurred in Southwest Africa, Syria, Western Samoa and Palestine. In each case the Council of the League has published a detailed report dealing with the facts and responsibilities, and some adjustment has been made as a result of the publicity. Numerous reports of abuses have been investigated and recommendations made by the Council have been acted upon by the mandatory. Observers report that the conditions in mandated areas compare favorably with those in neighboring colonies of similar type; and the meager statistics available indicate that in population growth, health, appropriations for native welfare, trade and investments progress of the mandated territories has been satisfactory. The detailed attention given by the Commission to the vital problems of native land tenure, wages, health and native

participation in the administration has thrown light upon the applicability of recommended standards in the widely diverse conditions represented by the fourteen mandated territories. The experience of Iraq indicates the high probability that a peaceful method for effecting the transition from dependence to independence has been achieved.

The natives of the more backward mandated territories have little organized opinion, and it is difficult to know their attitude toward the system. Nationalist aspirations in the more advanced regions have caused some restiveness, as in the case of the Arabs, who have been disappointed in their hope of immediate independence and feel resentment at the Zionist policy and at the division of their territory between French and British mandates in spite of the desire for union expressed to the King-Crane Commission in 1919. Former German settlers in some of the areas resent the fact that in most cases they have failed to get compensation for their land. The other white settlers, for the most part nationals of the mandatory power, chafe at the limitations imposed by the mandate upon their exploitation of natives and frequently express a desire for annexation of the territory by the mandatory. Several of the mandatories have occasionally manifested a desire to interpret the competence of the League organs in a restrictive manner and to develop the mandated territories as parts of their empires. The vigorous French insistence upon the right to recruit troops for general defensive purposes in its west African mandated territories has also been commented on as hardly in accord with the mandate principle.

In some cases possession of a mandate even without actual sovereignty has been of strategic and economic value to the mandatory. Thus the mandate for Palestine assures Great Britain a foothold on the north bank of the Suez Canal. This will probably be prolonged by the inherent difficulties of the Zionist policy, which is likely to delay the self-determination of this area longer than that of the other A mandated territories. The possession by Great Britain and France of mandates in Iraq and Syria has made it possible for these two nations to control the development of oil resources in the Mosul area and the course of pipe lines to the sea, although the United States succeeded after protracted negotiations in gaining the right for American oil companies to participate in the exploitation of these fields.

In spite of these criticisms and these instances

of imperial advantage gained from the possession of mandates the mandatories have formally exhibited entire good faith and have generally respected the resolutions of the Council in regard to mandates.

Recognizing the inevitable economic advantages which a mandatory will enjoy, no matter how carefully the open door principle is observed, the Permanent Mandates Commission has kept a particularly sharp watch over customs, investments, loans and concessions in mandated territories in order to check any abuse, conscious or unconscious, of the mandatories' advantages.

The opinion of the world has steadily become more favorable to the system, as is evidenced particularly by juristic, historical and humanitarian writers. The system was at first greeted as a thin veil for annexation, especially in the United States, Germany and Soviet Russia, and Communist organs have continued to brand it as the latest expression of imperialistic exploitation. The initial skepticism in the United States has been greatly modified by the study of the actual functioning of the system; and German opinion, particularly since Germany has become a member of the Council and a German has been a member of the Permanent Mandates Commission, has tended to support the system and vigorously to oppose any steps leading toward annexation of the areas or neglect of the principles of the Covenant. Italy as the only Principal Allied Power without a mandate has manifested great interest in the system and her representatives have exerted themselves to maintain its integrity. The Assembly, dominated by non-mandatory states and by states without colonial responsibilities, has been even more anxious than the Council to prevent whittling down the mandate system; and the Commission as a non-political and impartial body has taken its duties seriously and by the care, intelligence and energy of its members has made the League supervision a real force and has added to the stock of human knowledge on the problems of colonial administration.

The question of extending the administrative aspects of the system to other areas is less important than the extension of its principle. That system now embraces typical areas; if more were added, the Commission's administrative duties might swamp its scientific and investigatory functions. Nevertheless, the advantage of League supervision will doubtless be considered if a future political exigency should suggest a change in the status of a dependency. The League's

major work, however, is to focus attention on the problems, to coordinate investigations and experiments toward a solution and to see that the mandated areas are administered in the interests of the natives and of the world according to the best available learning and experience, thus setting examples for the administration of backward areas everywhere. In this work it has during its first ten years achieved a high measure of success.

MANDEVILLE, BERNARD DE (1670-1733), British physician and moralist. Mandeville was born at or near Rotterdam, took his degree in medicine at Leyden in 1691 and shortly after-

ard emigrated to England. His most important work, *The Fable of the Bees: or Private Vices public Benefits*, was one of the most widely read and controverted books of the eighteenth century. Mandeville's thought is scarcely a coherent whole, although it embraces many clearly developed ideas of considerable importance in ethics, psychology and economics. He professes to accept the traditional conception that virtue consists solely in self-denial or the victory of reason over the passions. Hence the paradox of the *Fable*, which assigns to the "vices" of men—their pride, self-interest and desire for material well-being—the chief responsibility for the prosperity of modern societies. Mandeville's psychology is egoistic: reason is everywhere the tool of the passions and the passions are rooted in self-love. What passes for unselfishness in human nature is the result of social pressure working upon subtle forms of self-love: "Moral virtues are the political offspring which flattery begot upon pride" (*Fable* I, 51). Significant for the history of economic theory is Mandeville's insight into the importance of self-interest in the economic order. He sees that the satisfaction of the wants of a complex society results from the unwitting cooperation of innumerable individuals each working for his own interest; and he asserts that the proper balance of these interests on which economic well being depends is most likely to be maintained when they are least interfered with by government or charitable agencies. Here he clearly anticipates the basic philosophy of laissez faire. Other less important contributions to economic thought are his perception of the logical nexus between self-interest and the division of labor and his defense of luxury. Mandeville's work was well known to Adam Smith and must have influenced the shaping of Smith's economic doctrines. His analysis of human nature was likewise influential, although in a different way. By showing the compatibility between the orthodox conception of virtue and what he regarded as the springs of human conduct he acted as a powerful stimulus to ethical inquiry; and the later psychological moralists, such as Hume, Adam Smith and Mill, even when they do not agree in full with Mandeville's egoistic analysis owe much to the acuteness with which he laid bare the ramifications of self-love.

GLENN R. MORROW

Important works: *The Fable of the Bees* (2 pts., London 1749-50; modern edition by F. B. Kaye, 2 vols., Oxford 1924); *Free Thoughts on Religion, the Church*

and National Happiness (London 1720); *An Inquiry into the Origin of Honour* (London 1732).

P., "The Fable of the Bees" in *Journal of Philosophy*, vol. xxiii (1926) 561-79; Morize, André, *L'apologie du luxe au XVIII^e siècle* (Paris 1909).

MANEGOLD OF LAUTENBACH (c. 1060-c. 1103-19), German monk and political theorist. Manegold was born in Germany, at an early age entered the monastery of Lautenbach in Alsace and after the demolition of the monastery by supporters of Henry IV spent some years in wandering until he found refuge at the monastery of Raitenbuch in Bavaria. By 1090 he had returned to Alsace; there he helped to found the monastery of Marbach, of which he was *praepositus* after 1096.

Manegold, whose principal treatise, *Ad Gebhardum* (dedicated to Archbishop Gebhard of Salzburg), was written probably in 1085, was the most incisive of the writers who defended the action of Hildebrand in deposing Henry IV. In so doing he was primarily concerned not with the question of the authority of the spiritual power over the temporal but with the principle that the authority of the secular ruler is derived from the community. Far from holding a low view of the political order Manegold asserts quite dogmatically that it is derived from God. Whatever may have been the attitude of others, Manegold treats the royal authority with the profoundest deference, for its purpose is to maintain justice. He is clear that the function of the temporal power is a moral one. But he draws a sharp distinction between the office and its occupant, refusing to admit that the divine nature of the former involves unlimited power and irremovability on the part of the king (*Ad Gebhardum*, 30, 39, 43). Indeed he emphatically repudiates the doctrine of Gregory the Great that the ruler must always be obeyed. While suggesting the possibility of a different interpretation of Gregory's words Manegold unhesitatingly declares that if the pope really held such a view, he was wrong (45).

His own view is positively set out in the well known passage (30) where he says abruptly that the king who plays the tyrant has forfeited his right to his great office and that the people are free from all obligation to obey him, for he has violated the agreement or contract (*pactum*) by

virtue of which he was appointed. With characteristic plainness of speech he supports this by an analogy with the relation between the swineherd and the man who entrusts his swine to him for a suitable wage. If the swineherd slays or steals the swine, the owner will refuse to pay the wage and will dismiss the swineherd from his service. As far as is at present known, this is the earliest general statement of the theory of a contract or agreement between the people and the ruler, which finds its classical expression in the Declaration of Rights in the English Revolution of 1688. But Manegold is only putting into precise phrase a conception which is implicit in the conditions of coronation as early as the ninth century and is the fundamental principle in the feudal relation of lord and vassal. Manegold's words represent the normal conception of the Middle Ages, the crystallization of a whole movement of political principles and conditions into one great phrase.

A. J. CARLYLE

Works: The *Ad Gebehardum Liber* has been ed. by Kuno Francke in the *Monumenta Germaniae Historica*, *Libelli di Lite*, vol. i (Hanover 1891) p. 300-430.

T., "Manegold of Lautenbach" in *English Historical Review*, vol. xxix (1914) 1-15.

MANGOLDT, HANS KARL EMIL VON (1824-68), German economist. Mangoldt was *Privatdozent* at the University of Göttingen in 1855 and in 1862 he was appointed professor of economics at the University of Freiburg. Mangoldt's significance lies in the fact that in the period from 1855 to 1868, when the historical school of economics was exercising a predominating influence in Germany, he kept alive the interest in theoretical economics and, in a series of important books, furthered the systematic treatment of economic theory. His general approach was that already followed by Hermann; that is, with all his high regard for the importance of classical economics he examined its doctrines in the light of economic reality and modified them accordingly. Mangoldt's doctrines exercised considerable influence especially on the theories of rent and profit. He was the first in Germany to point out that rent is in no way a special phenomenon confined to agriculture and mining but an element of income which may ac-

crue to any factor of production whenever the latter enjoys a particular advantage in the market. Marshall later readopted this line of reasoning, although with more cautious formulation. He distinguished sharply between profit and interest and regarded the former as a payment for risk and entrepreneurial ability, thus constituting an independent category of income. Mangoldt was among the first to use the graphic method in illustrating the process of price determination; notable too is his use, although in somewhat obscured terms, of the concept of elasticity of supply and demand in the theory of international trade.

KARL DIEHL

Chief works: *Die Lehre vom Unternehmerrgewinn* (Leipsic 1855); *Grundriss der Volkswirtschaftslehre* (Stuttgart 1863; 2nd rev. ed. by F. Kleinwächter, 1872); *Volkswirtschaftslehre* (Stuttgart 1868).

MANIN, DANIELE (1804-57), Italian statesman. A liberal in politics and economics, Manin promoted the enthusiastic welcome tendered by Venice to Richard Cobden on his visit in 1847. Before 1848 he favored legal resistance to Austrian oppression in Lombardy-Venetia, but after the outbreak of the revolution he headed the provisional republican government of Venice. In 1849 he maintained the military campaign against Austria at a high pitch, ruling the republic with dictatorial powers throughout the struggle. After the fall of Venice in August, 1849, he fled to Paris, where he passed his last years in poverty as a teacher of Italian.

During his exile he adopted monarchist views, advocating Italian unification under the house of Savoy, which had inaugurated in Piedmont a sound liberal and national policy. The change in Manin's views involved him in heated controversy with Mazzini. He exerted an extremely important influence in the reorientation of the national movement. Garibaldi and other illustrious republican patriots followed Manin, who became the first president of the *Società Nazionale*. His work in the successful liberation struggle which began in 1859 was of inestimable value.

MANN, HORACE (1796-1859), American educator. Mann was born in Massachusetts and educated in district schools and at Brown Uni-

versity, where he taught for two years. He then took up law and entered politics, sitting in the Massachusetts legislature from 1827 to 1836 and in Congress from 1848 to 1853. He was early interested in social reform; he sponsored legislation against intemperance and gambling and for state care of the insane. Mann was directly responsible for the act creating the state Board of Education and served as the board's first secretary from 1837 to 1848, in which capacity he was responsible for the twelve volumes of its annual reports. Impressed by the need of competent teachers in public schools, he championed the movement for normal schools; and it was as a result of his efforts that the first normal school was opened at Lexington in 1839, financed in part by the state and in part by Mann's friend Edwin Dwight of Boston. In 1843 the legislature passed resolutions advocated by Mann providing for the support of normal schools and school district libraries. Mann founded and edited the *Common School Journal* from 1838 to 1848. From 1852 until his death he served as the first president of Antioch College.

Mann emphasized what are regarded as essentials by modern educators: that the first condition of education is health; that school reform is always schoolmaster reform; that training rather than instruction is the true method; that the development of mind and character by a wholesome moral training and what is today called mental hygiene is the aim of true education; that instead of competition the spirit of cooperation and democratic ideals should be developed by the public schools; that a method which makes good schools but bad pupils is folly.

A disciple of Combe and a phrenologist, Mann was strong in logic but weak in psychology. Although in a conflict with conservatives which demanded agility and cleverness he was impeded by a ponderous rhetoric he had great influence through lectures and writings. He was a great teacher who did significant work in improving public school education, and his great service for the training of teachers is likely to be recognized as his permanent contribution to social progress.

(Philadelphia 1910); Martin, George Henry, *The Evolution of the Massachusetts Public School System* (New York 1894).

MANNING, HENRY EDWARD (1808-92), English cardinal and social reformer. Manning, an Anglican pastor from 1832, became affiliated with the High Church movement and in 1851, six years after Newman's secession, was converted to Catholicism. In 1865 he was appointed archbishop of Westminster. Manning's main contribution to the Catholic revival was his social work undertaken in accordance with his deliberate policy of reawakening the Catholic masses in England. Consisting chiefly of poor Irish immigrants in the industrial cities and seaports, the masses had been generally out of sympathy with the previous church leaders, who were mostly drawn from a few aristocratic families.

As a result of his experience with the immigrants, particularly in his work of establishing and maintaining Catholic schools, Manning became a passionate crusader against intemperance. One of the foremost advocates of temperance in England, he founded the League of the Cross to promote the cause and organized it throughout the country with great success. His constant endeavors to assist the poor won him the sympathy of social reformers who were strongly prejudiced against the church and greatly increased Catholic influence in England. In 1884 he sat with the prince of Wales in the Royal Commission on the Housing of the Working Classes. In spite of much criticism from other Catholics he cooperated in the social reform activities of such religious movements as the Salvation Army and openly supported W. T. Stead when the latter was imprisoned in 1885 for his sensational exposure of the white slave traffic. As Anglican arch-deacon before 1851, he had done much work among agricultural laborers and during the 1870's he gave powerful support to the Agricultural Labourers' Union. His lecture "The Rights and Dignity of Labour" brought him into close touch with the younger labor leaders who were organizing the dockers and other unskilled workers. During the London dock strike of 1889 his letters in support of the dockers induced them to solicit his mediation; the final settlement of the strike was due entirely to his efforts. Manning was successful in emancipating the English church from the domination of the conservative landowners. According to his own statement he learned his radical politics from "Moses and St. Paul" and had "compassion on the multitude because they have nothing to eat."

He became closely associated with the similar activities of Cardinal Gibbons in America and together with him had a direct influence upon Pope Leo XIII's encyclical of 1891 on the condition of the working classes, which laid down the program of modern Catholic social reform. This encyclical fully endorsed Manning's championship of the trade unions and his demands for the regulation of female and child labor, for shorter working hours, for public relief in times of distress and unemployment and for state interference to enforce justice in economic relations. Like Leo XIII, Manning condemned socialism as a denial of the right of private ownership, insisting that true social reform lay in a better distribution of property.

DENIS GWYNN

MANORIAL SYSTEM. The manorial system was a type of economic, social and administrative organization based on land tenure, which bound together in a nexus of interdependent relationships the landowning class and the land tilling peasants. At the same time it represented a unit responsible for performance of political and communal obligations. The nucleus of the organization was the manor, to which were attached a number of dependent peasant holdings. The lord reserved for his own immediate use what as a rule amounted to only a small section of his total land, the remainder being parceled out among the peasants in return for services and dues which were applied to the maintenance of the lord or to the upkeep of the manor. The economic activities of the manor in its wider reaches comprised work in the fields, in the meadows, in the pastures and in the forests; gardening, wine growing, beekeeping and fishing; and in addition conversion of the various natural products into usable commodities. Thus the requirements not only of the lord's household but of the smaller units were practically always guaranteed; and favorable conditions might result in a surplus.

To an age of economic decentralization and barter economy the manorial system was well adapted. Despite the occasional opportunities for trading with the outside world the manor was essentially a self-sufficing unit in which the requisite economic goods were produced within a more or less extended domain of interconnected agricultural enterprises. From a political point of view as well the manorial technique proved itself particularly useful in defending the country, in administering and executing justice, in raising taxes and in the other problems of administration which beset a highly localized and decentralized political system. Thus the institution of the manor becomes in a very real sense the reflection of feudalism in its period of expansion during the early Middle Ages and later during its period of gradual decline.

With the passing of antiquity the manorial system established itself throughout wide areas of Europe, contributing to the progress of agriculture and to the regulation of social life. The germs of manorial organization are discernible in the typical late Roman latifundia, the nucleus of which consisted of consolidated areas of cultivation worked by slaves and grouped around a central villa. On condition that he continue to contribute his services to the estate the slave might be granted a separate house and a certain amount of land, thus becoming a *servus casatus*, while the small free tenant (*colonus*) might be allowed to rent a parcel of ground, sometimes with premises. The settlement of moderate size which thus arose around the villas did not, however, constitute in Roman law an actual village community (*universitas*), for which definite limits were prescribed. Under the empire the colonate came to fill an increasingly significant function, especially upon the adoption by the government of the program of fostering internal colonization as a means of revitalizing the native strain. The owners of the large estates were charged also with the administration of taxes and justice; and after the legislation of Constantine, which converted free payers of land taxes into *glebae adscripti* bound to the soil, the power of the great landowners steadily increased, until by the end of the Roman period they exercised control over both consolidated and scattered domains. The deep influence of these two types of manorial organization is repeatedly revealed during the early Middle Ages in Italy, Gaul, Spain, southern Britain and along the Rhine. In spite of the violent disruption of property caused by the northern invasions the economic forms of the

Roman agrarian system involved striking powers of persistence. The same uses of exaction are traceable in the Eastern Byzantine Empire, although certain of the emperors friendly to the peasants—such as Theodosius II—on the one hand, and certain of the emperors hostile to the peasants—such as Justinian I—on the other—attempted on occasion to protect the free farming population that was liable to military service.

At the same time it is apparent that a deep influence was exerted on the mediæval agrarian system by the migrations of the Germanic tribes, however greatly hypotheses may vary as to the type of settlement and the nature of these tribes. Certain scholars, such as F. J. Schönbauer, J. J. Schönbauer, J. J. Schönbauer, such Germanic legal and economic historians as G. von Maurer, H. Brunner and A. Meitzen, maintained that the essential features of the Germanic system of land tenure were the free mark association (*Markgenossenschaft*) and the village community (*Dorfgemeinde*) and that the manor was the outgrowth of a later development which took place somewhat after the final period of tribal consolidation. Other scholars, particularly Denman Ross, Seebohm and Fustel de Coulanges, have insisted that the manorial system derived from conditions prevailing during the late Roman period. R. Hildebrand maintained that the origins of the system were contemporary with the primitive transition to agriculture, while the careful researches of Dupich would likewise indicate that its origins are to be sought already in the early Germanic period. But even if it is true that the Germanic tribe possessed colonized slaves resembling the Roman coloni, it is nevertheless difficult to prove that these tribes had a well developed organization comparable with the manorial institution. The most convincing hypothesis is that the Germanic system of the manor developed gradually from the village community of the Roman period, and that the manorial system was the result of a process of gradual development which took place during the early mediæval period.

[illegible]

manifested a wide variation as to both size and method of administration, a composite sketch may be attempted. The lord's residence, fortified and surrounded by ditches, stood in the center of a village, the lord coming here to plan and situate near a road or crossroads. The servants—or in the earlier period slaves—lived on the estate, while in the village were located the houses and farm buildings of the peasants and the other dependents who occupied a more humble legal and economic status in the prevailing hierarchy. The freemen (socmen or geneata) are thought to have been originally free, tax paid, or paying peasants who assumed a status of dependency by committing their personal protection to the lord and by surrendering to him the prerogatives of taxation and judicial administration. Below the socmen in the hierarchy were other peasants (geburgs, villeins) more heavily burdened with obligations, especially with labor dues. The differences between these social groups gradually disappeared, the designation villagers (villeins) coming to be applied to all indiscriminately. Beneath the peasants there were also cottars (cotmels), who possessed nothing more than a house and a small piece of land.

The manor and the village had at their disposal a broad expanse of land—arable fields, meadows, pastures and forests—as well as springs, streams and lakes. The arable land was cultivated on the open field system; the individual holdings were unseparated and unfenced. The land of the lord (demesne), which usually contained between 300 and 400 acres, was made up as a rule of large block shaped tracts, although occasionally his parcels were scattered among those of the peasants. The cultivated land of the villagers was cut up into a number of sections (furlongs), which were in turn subdivided into strips. The individual peasant owned a number of narrow strips which were widely scattered over the whole area. The unit of measurement was an acre, made up of strips of a definite width, usually 4 rods. Originally the share of land seems to have consisted of 12 strips or a hide, which was later reduced to a quarter of a hide. The hide, composed of strips 4 yards wide, was apparently calculated for three or four eight-belt animals, while the yardland (1 acre) with its 4 yard strips, was designated for a double team of oxen, within a short time, however, forms of land tenure began to deviate in numerous ways from this norm. The arable land was cultivated on a three-field system: one part of the fields was assigned to summer crops, another to winter crops, while a third

part was left fallow. Since the separate strips were not immediately adjacent to the farmsteads, it became necessary to introduce joint responsibility for work in the fields (joint labor). If at the outset this regime guaranteed a uniform distribution of labor by forcing the idle to share in the production, it tended to become in the course of time a barrier to economic progress. Pastures and forests were regarded as common (*gemeen*) lands and were under the control of the community. The former were used in common, while the use of the latter—as, for example, in the gathering of wood—might be left to the discrimination of individual villagers. Beekeeping and fishing also were originally communal enterprises. The lords, however, reserved special rights for themselves, such as hunting, and after the arrival of the Normans they acquired sovereign rights over all the lands. The peasants were obliged to render dues in kind and sometimes in money and to perform services. Labor services being indispensable to the upkeep of the manor became obligatory even on villagers who had originally been freemen. In addition to furnishing labor and teams for tilling and transportation and rendering various kinds of assistance on certain set days and weeks, the peasant found himself increasingly liable to emergency requisitions arising oftentimes from the whim of the lord as well as to special taxes in the event of a death or a marriage. There were also within the manor shepherds, fishermen, beekeepers, blacksmiths, joiners and cloth makers. With the gradual disappearance of many of his privileges the lot of the peasant became an increasingly unenviable one.

Since the manor constituted a convenient administrative unit, it served well the purposes of the state. Apart from the payment of general taxes and the fulfilment of special obligations it was called upon for the *trinoda necessitas*, i.e. the building of roads and bridges, the proper maintenance of castles and military and naval contributions in money or men. Being charged in addition with the administration of justice (*take and soke*), it set up courts which dealt with manorial affairs, in accordance with customary law (*customs*), and dealt also with cases of public law.

The manorial system reached the peak of its development in England during the period of the Norman Conquest, revealing those characteristic forms which are preserved so clearly in the *Domesday Book*. Thereafter it gradually lost its economic and political significance. Although

the beginnings of this system in Ireland and Wales may be traced to the tribal period, it did not take a clearly defined shape in these countries until their conquest by the English.

The development of the manorial system in France (*seigneurie domaniale*) was strikingly systematic, especially in the northeast and in the adjacent southern Netherlands. In Normandy and Bretagne, however, as well as in the south the development was less complete and displayed numerous deviations from a strictly logical train. An excellent picture of the French system is presented in the vivid *Contadine de s'ele* issued under Charlemagne. The organization of the village was similar to that of the English hamlet. The power of the lord, however, was greater, as can be seen from the fact that the right of the villagers extended only to the usufruct of the forests and common pastures (*communaux*). The estate was managed by a *manse*, who was assisted by *agents* and *prebys*. The manse (*curat manse*) was surrounded by the premises of the peasants (*manse, mers, mes*). Some of the latter were free tenants (*colonus franci*) who had to fulfil certain obligations in accordance with customary law (*coutumes*), but most of them were *serfs*, who had to pay personal dues (*taille*, *mannate*, *formarrage*, *chirage*) and to perform labor services for the manor, as in the fields and mills. For the reclamation of uncultivated lands outsiders, known as *gasts* (*hôtes*), were engaged on somewhat better terms. The lords enjoyed legal immunity and exerted over their subjects an authority which applied to both persons and property. More important still they exercised a jurisdiction over adjacent areas extending beyond the original limits of the manor. In this way a system of territorial organization was evolved, composed of seignories whose inhabitants not only were subject to the sovereign rule of the lords but also were burdened with dues and services. While in southern France peasants enjoyed great leeway, in the northeast there came to prevail the principle *non terre non vassal*.

Early medieval Italy likewise possessed a clearly defined manorial technique. The typical Italian manor was surrounded by holdings of free peasants (*manentes manentis*) who enjoyed various rights, as well as by lands that were held on leases (*coloni*). The lord, however, and the Italian cities, which since the Roman period had been aggressive in the defence of their privileges, became the dynamic force in the economic and political life of medieval Italy, causing the system of land tenure to assume more liberal forms

as regards the system of rent, free leasing and particularly free labor. Similar conditions obtained in early mediaeval Spain. At a later period, however, differences began to appear between northern Spain, which preserved its manorial institutions, and the southern provinces, which under the yoke of Moslem rule witnessed the virtual abolition of the manor.

In Germany the manorial system expressed itself in two forms, which differed as regards both their economic organization and administration and their relationship with the agrarian communities. As a rule the crown and church lands and the large secular possessions were scattered over wide areas, as were also the smaller estates. The manorial system (*Fronhofsverfassung*, *Villikation*) seems to have constituted during the early Middle Ages the most important form of agrarian organization. Surrounded by closely grouped peasant farms (*Mansi*, *Hufen*), the manor (*Salhof*), restricted oftentimes to a few *Hufen* of acreage, formed a center of economic activity which embraced the various branches of agriculture, forestry and manual trades. In the looser form of manorial organization, which existed, particularly in northwestern Germany, side by side with this more familiar type, small independent holdings were likewise frequent; but the role of the manor was essentially different, being little more than a center for collecting dues. In the more familiar type the manorial association (*Hofgenossenschaft*, *familia*) was divided into social groups: free tenants, full serfs and servants; but gradually these differences were replaced by a common legal system (*Hofrecht*), in which the members constituted an organic unity, although differences of possessions and obligations continued to be recognized. When the manor controlled several villages (*Dorfgemeinde*) or an entire rural district (*Dorfmark*), it frequently combined for administrative purposes with the village communities, a manorial official (*Meier*, *Schulze*) serving also as head of the village association (*Dorfgenossenschaft*). The lot of the peasants improved after land rents and labor services had become fixed. With the Hohenstaufens the manorial associations (*Fronhofsverbände*) began to reveal marked symptoms of deterioration, and in the west of Germany the feudal system as a whole began to manifest symptoms of petrification and decay.

In the region east of the Elbe, however, there began to appear shortly after the German recolonization a more intensified and rigorous adaptation of the manorial technique (*Gutsherr-*

schaft), which also manifested itself in the territories which had remained under Slavic rule. This marked recrudescence of the manor is attributable primarily to the increasingly common practise of endowing knightly warriors with colonial estates, which were operated by dependent peasants and cottagers. At first these estates served to supply local needs. Later, however, particularly with the close of the Middle Ages, the rise of cities not only in Germany but also in Holland and England created a tempting market for farm products, especially cereals and wool. Glimpsing the possibilities of large scale production, the lords of the manor purchased or if necessary seized the holdings of the peasants, thus creating large enclosed domains within which they improved agriculture, exerted jurisdiction and levied taxes. Such enterprises (*Gutsherrschaften*) may therefore be said to constitute a continuation of the *Herrengutssystem* of the earlier Middle Ages.

In the Scandinavian countries the agrarian system manifested the characteristics of a peasant culture, although manorial institutions with a system of land renting existed even here. They were less frequent in Norway than in Sweden and Denmark, where villages and land organization resembled the English system.

In the Slavic east agrarian property relationships assumed a distinct form relatively late after the region had come under the influence of the Byzantine and western civilizations. In Poland, where the masses of the agrarian population early found themselves in a state of dependence because of the so-called rights of the princes, the manorial system is known to have existed in the twelfth century and probably originated even earlier. The princes and the noblemen enfeoffed by them had exercised authority over manors. A characteristic institution was the so-called service settlements (*osady slouzhebne*), the name of which indicates the presence of persons serving in specialized capacities, such as clerks, hunters, fishermen and blacksmiths, and seems to suggest a more definite distribution of economic function. It is scarcely to be assumed that the east German colonization contributed immediately to the development of the manorial system (*Herrengutswirtschaft*) in Poland, inasmuch as the villages, settled in accordance with German law, were composed chiefly of peasants. But it is not unlikely that noble estates arose at a later period out of the holdings of the leaders of the colonization (*Lokatoren*, *Schulzen*) or that the lords deliberately acquired such estates as a

step toward the development of a manorial system. In any case the *Gutsherrschaft* was widespread in both Poland and Lithuania.

In the agrarian system of Russia, which developed under the influence of the Varangians and of the great cities Kiev and Novgorod, a sharp differentiation must be drawn between the white land, on which were located the great estates of the princes, boyars and monasteries, and the black land, held by the large masses of the free rural population. The lords possessed feudal estates (*kormlenie*) as well as widely extended possessions whose economy rested on the payment of dues (*obrok*) and the performance of labor services (*robot*). The situation of the serf (*kholop*) was miserable as compared with that of the obligated tenant (*sakup*). At a later date there are indications of a wide variety of social gradations among tenants. As a rule the manors in Russia were not connected with village settlements. A characteristic institution which began to make its appearance after the sixteenth century was the mir, or village community, with its peculiar system of landownership, according to which the distribution of land was dictated by the numerical size and needs of the family. According to some scholars the mir is an ancient institution, while others connect it with serfdom and derive its origin from the communal liability for taxes.

It is readily apparent that the manorial system and other related forms of land tenure fulfilled a highly useful function from both economic and technological points of view. The more systematic organization of labor and the greater rationalization in management led to an increase in the variety and quantity of production as well as to an improvement in the methods of farming. Not only were opportunities thereby created for greater demand and a more abundant local consumption, but it also became possible to sell agricultural products to the outside world and in this way to prepare the way for an economic development that extended beyond the limits of the village and the manor. In these benefits the peasants likewise shared despite the fact that at the same time they were heavily burdened with obligations which were augmented by exactions on the part of the state and the church. The economic importance of the mediaeval agrarian system declined with the rise of commerce and money economy and the emergence of cities. Manorial obligations began to lose their force; dues were simplified and fixed in the form of rent. The labor services, which in many cases

had become unprofitable, were in the main abolished, being replaced by money payments with which labor was hired. Furthermore a system of free leasing—for a period of years or for life—became common; the heritable lease was likewise resorted to after the manner of the Roman emphyteusis. There ensued a rapid increase in the number of free small tenants, farm laborers and servants who sold their labor voluntarily. The social consciousness of the rural masses was awakened; the intellectual movement which began during the crusades gained in momentum. In the thirteenth and fourteenth centuries peasant revolts occurred sporadically in both France and England. Germany following local insurrections during the late Middle Ages experienced its great Peasants' War during 1524-25 without, however, undergoing a radical modification of its agrarian system. But a profound transformation of the prevailing system was brought about by general economic changes, which first made themselves deeply manifest in England. The owners of the great English estates responding to the growing demands of an expanding commerce entered upon a period of large scale enclosure, concentrating especially on the conversion of arable land into pasturage. Mediaeval conditions persisted much longer in France and western Germany, while in eastern Europe the manorial system showed remarkable capacity for adapting itself to the demands of agrarian capitalism. Under the aegis of mercantilistic and later of physiocratic doctrines the various European states with an eye to increasing population and state revenues attempted to foster the welfare of the peasants, especially in the matter of land tenure. It became increasingly apparent, however, that efforts at rural reform had little chance of success as long as the older agrarian system was allowed to continue. Effective reform even when undertaken on such a large scale as in England and Denmark seemed to call for the removal of the existing personal obligations of the peasants, the abolition of land dues, the division of communal lands, the elimination of joint labor by fusing the scattered parcels and the reorganization of rural communities. In France this was the work of the Revolution of 1789, in Germany of Stein and Hardenberg in 1807 and the Revolution of 1848, in Russia of Alexander II and his reforming ministers of 1861. Although these various reforms are the expression of a similar spirit, the process of carrying them into execution represents a variety of adjustments to the historically conditioned agrarian patterns of the

different countries, which continue to reflect even to the present the peculiarities of their historical evolution.

MANSFIELD, FIRST EARL OF, WILLIAM MURRAY (1705-93), English judge. Although of Scottish origin Mansfield secured recognition as the leading figure of the English bar before reaching the age of thirty-five. He was made solicitor general in 1742 and was for the next fourteen years one of the leading figures in parliamentary history. By birth a Jacobite, he was in politics a Tory who nevertheless held moderate views, and he was truly characterized by Macaulay as "the father of modern Toryism, of Toryism modified to suit an order of things in which the House of Commons is the most powerful body in the state." Becoming attorney general in 1754 he was the leader of the House of Commons for two years under the administration of the duke of Newcastle. In 1756 he was appointed chief justice of the King's Bench; he resigned from this office in 1788, passing the last five years of his life in retirement.

Mansfield's career both in politics and on the bench was colored by many dramatic incidents. His decision on some of the important constitutional questions that arose from the activity of John Wilkes brought him into popular disfavor, and he was bitterly attacked by Junius as showing marked leanings toward arbitrary power; he nevertheless pursued the course which he held to be right. His support of the Roman Catholic Relief Act of 1778, dictated by his tolerance, made him obnoxious to the opponents of that measure and in the celebrated anti-Catholic Gordon Riots of 1780 he not only barely escaped serious bodily injury but also suffered the destruction of his house by fire.

Mansfield's chief title to fame rests on his judicial career. As a judge in criminal cases he earned a reputation for fairness and impartiality, but it was his work in commercial law which won him recognition as one of the greatest of English judges. Lord Holt, who fully appreciated the importance of molding the principles of the common law to meet the new conditions of commercial life, had already prepared the way for Lord Mansfield; but it was the latter with his remarkable knowledge of foreign legal systems who settled the principles of English commercial law on their modern bases. Indeed he practically remade the law relating to shipping, insurance and other commercial transactions; and by basing "quasi-contractual obligations" on the broad grounds of natural justice and *aequum et bonum*, as opposed to the earlier theory of a fictitious contract, he contributed much to the placing of that branch of the law on its modern founda-

tions. It was in fact by him that rules which previously as part of mercantile custom had bound only those who had been proved to be merchants were woven into the common law of England.

Great as was Mansfield's achievement in finally incorporating the law merchant in the English common law system, it had one serious defect: in his desire so to mold the common law as to meet modern conditions he was led to usurp in important particulars the function of the Parliament. Like many other men of his time he held firmly to the idea that the eighteenth century was the most enlightened age in English history. Since the earlier precedents of English law came in his judgment from a barbarous age, he felt it necessary to disregard or remold some of them; and it was this same position again that caused him to seek to do away with the long standing historical separation between law and equity by giving full recognition to equitable as well as legal rights in the courts of common law. Influenced by the canonists' conception of *causa* and the Chancery notion of consideration, he introduced in common law cases the principle that moral obligation was a consideration which would support and make binding a contractual promise; and viewing consideration as purely evidentiary he held that a promise embodied in any writing, even though not under seal, was enforceable. But although these and indeed most of Mansfield's innovations were rejected by later judges as incompatible with the processes of legal development by judicial precedent, it is a striking testimony to his remarkable foresight as a legal reformer that some of his heretical doctrines were incorporated in the law at a later time by means of parliamentary acts. The Judicature Acts by fusing the courts of law and equity finally gave expression to his idea of recognizing equitable rights in a court of law. His work in reforming various parts of common law jurisdiction fails to equal his achievements in commercial cases only by virtue of the truly remarkable character of the latter.

MANU, CODE OF. *See* LAW, section on HINDU LAW.

MANUAL TRAINING. For over three hundred years leading educators in various countries have considered and worked toward the methods of teaching and the content of instruction which are known today as manual training, or industrial arts education. Among the earliest of these educational pioneers was Comenius (1592-1670). The educational practise of his day and of many later years was characterized by instruction which was almost exclusively bookish, but Comenius contended that doing and thinking should be combined. During the next century Rousseau carried forward much of the same thought about the need for learning through actual participation instead of by merely talking about things. In turn Rousseau's teachings struck a responsive chord in Pestalozzi, who had a great influence upon educational theory and practise and particularly upon such of its forms as have been called manual training, and in Fröbel, whose belief in the educational value of handwork also attracted wide attention. The specific prototype of manual training, however, was a form of instruction through craftsmanship which was introduced by Uno Cygnaeus into the elementary rural schools of Finland in 1866 and which subsequently had a great influence in Sweden.

In Sweden the sloyd system of handwork originated as an economic movement to protect domestic industry against factory competition, but it was soon adapted to educational purposes. In 1875 a sloyd training school for teachers was founded at Nääs by August Abrahamson and was conducted with marked success by his nephew Otto Salomon. The school soon had an international reputation and its influence extended to all parts of the world. Sloyd in Scandinavian countries involved the use of paper, cardboard, straw, willow, wood and iron. The courses of instruction were based upon a progressively arranged series of projects selected with due regard to prevailing home industries and everyday family needs. The objectives set forth by Salomon included the development of respect and love for work; of habits which make for order, exactness, cleanliness and neatness; and of independence and self-reliance. He advo-

cated work on useful, complete articles or projects and not merely on parts of articles or exercises; his instruction was based on educational principles; he showed that trained teachers gave better results than craftsmen without a professional background; and he coordinated the teaching of mechanical drawing and shop practice, as is done in progressive schools today. Despite its many desirable features sloyd never gained general recognition in the United States, probably partly because of the differences in interests, needs and modes of living which obtained there as compared with Sweden; but it did have a manifest influence on the later development of manual training in the United States.

About the same time that sloyd was being placed on an educational basis in Sweden, Victor Della-Vos at the Imperial Technical School in Moscow was experimenting with methods of teaching shop work. In 1868 he conceived the idea that workshop operations could be reduced to a series of logically arranged exercises. This system would facilitate teaching, would be more economical of material than the former apprenticeship system and would, he thought, contain the chief elements of the craftsmanship training which is required for all trades. An exhibit of these exercises, made in wood and metal, was shown at the Centennial Exposition in Philadelphia in 1876, where it attracted wide attention. Calvin M. Woodward, who was dean of the Polytechnic School of Washington University in St. Louis, John D. Runkle, who was president of the Massachusetts Institute of Technology, and other educators were highly impressed with the Russian system and became the pioneers of manual training in the United States. Industrial drawing had been introduced into the public elementary schools of Massachusetts in 1870. During the same year the University of Illinois independently of Salomon and Della-Vos had opened wood and ironworking shops in connection with courses in architecture and mechanical engineering. Stevens Institute in Hoboken, New Jersey, had equipped a series of shops and Washington University had started a shop for engineering students in 1872. Between the years 1883 and 1898 over one hundred manual training centers were established in the public schools of the United States.

Manual training in the United States was influenced by both the models of sloyd and the exercises of the Russian system. The country was in a stage of rapid industrial development and the consequent inventions, discoveries and

technological changes were making it necessary even as in the present day for workers to readjust themselves vocationally. Many educators of the late 1880's and the 1890's thought that the general exercises of the Russian system would go far toward solving their problems. On the one hand, there were men like Runkle and Woodward who believed that manual training should be regarded as a part of general education; on the other hand, there were many who thought that manual training would help to supply the existing shortage of skilled craftsmen. Some favored it as a means of vitalizing the rest of the curriculum, whereas others looked upon manual training as deserving coordinate rank with other aspects of general education. In those pioneer days the teachers were either skilled craftsmen selected from the trade or men with engineering training. In neither case were they trained professionally.

During the last forty years and more particularly during the last two decades, rapid changes have taken place in the field of manual training. The very term is now almost obsolete in some sections of the United States and other terms are substituted, such as manual arts, mechanic arts, practical arts and industrial arts, which have somewhat synonymous although not identical meanings. The term practical arts is broad and inclusive, covering industrial, agricultural, home making and commercial arts education, much as vocational education includes trade or occupational training in these four major fields. Industrial arts, which is probably the most desirable term, stands for a modernized, broadened, enriched, professionalized and socialized manual training. It is as different in theory and practice from the old style manual training as are modern junior high school theory and practice from the traditional system of twenty years ago. Manual training emphasized what the word implies—manual work and habit formation controlled by a disciplinary conception of education—whereas industrial arts stresses mental and social development and the learning content involved. Manual training called for teacher developed assignments, whereas industrial arts calls for purpose, plan, execution and judgment on the part of the pupils under the guidance of the teacher. Industrial arts is distinctly a part of general as distinguished from vocational education. Neither manual training nor industrial arts has ever functioned effectively as trade education.

Industrial arts education should be thought

of as a phase of general education starting from the first grade and continuing through the high school. The specific objective of elementary industrial arts is to introduce the child to the major fields of industrial arts activities, which center around such problems as food, clothing, shelter, utensils and tools and machines. In the junior high school exploratory and guidance values are among the most important. Most progressive school districts require industrial arts in the junior and make it elective in the senior high school.

Among the teacher training institutions which have molded public opinion and have strongly influenced the quality and content of industrial arts education Teachers College of Columbia University deserves a foremost place. Under the leadership of James E. Russell and of his son William F. Russell and through the philosophy and instruction of the late Frederick G. Bonser, Teachers College has profoundly affected industrial arts educational practise in many countries.

Manual training, or industrial arts instruction, in other countries reflects the progress that has been made since the beginning of the twentieth century in educational theory. In France industrial arts education is given in close correlation with drawing, mathematics and other school subjects. France feels that cultural education is very important and teaches industrial arts from that standpoint. In Germany post-war educational reforms are stressing the full development of individual powers as distinguished from the overemphasis of unapplied knowledge. The *Jugendbewegung*, or youth movement, illustrates this point. German industrial arts education is sponsored in large part by private organizations; it is generally recognized as an important element in developing artistic appreciation and furthering creative art and superior craftsmanship. England has likewise learned that instruction in the industrial arts is essential to a well balanced program of general education and is giving increased attention to it, feeling that mass production is not wanted in its schools and that education—including industrial arts education—should always remain in the realm of the teachers who are artists and craftsmen.

MANUILOV, ALEXANDR APOLLONOVICH (1861–1929), Russian economist and educator. Manuilov was professor of economics at the University of Moscow. When the Russian universities were granted the right of self-government in 1905 he was elected pro-rector and later rector of the university. His devotion to the cause of freedom of higher education and his opposition to the reactionary policy of the czarist regime toward the student body won him the recognition of the educated classes in Russia. In 1911 Manuilov resigned from his post in protest against the recurring interferences of the government in matters of academic freedom. After his resignation, which was followed by a wholesale exodus of the faculty, he occupied the chair of economics at the Moscow Institute of Commerce and was editor of the section on economics in the new Brockhaus-Efron encyclopaedia. As a frequent contributor to and for a time editor in chief of *Russkiya vedomosti*, the foremost academic liberal publication in prerevolutionary Russia, he was guided in his policies by broad democratic principles rather than by adherence to any single party program; his fair treatment of the labor movement earned him the esteem of labor leaders.

Manuilov's scientific interests were in the field of land tenure, agrarian reform and monetary theory. His *Arenda zemli v Irlandii* (Land tenancy in Ireland, Moscow 1895), in which he analyzed the Land Law Act of 1881 and the Land Purchase Acts in Ireland, is still considered the standard work on the subject; it exerted considerable influence on the pre-war Russian agrarian policy of breaking up communal holdings and encouraging small peasant proprietorship. In his monetary theory Manuilov shared to a large extent the views of Zimmer, Wagner and Helfferich. Although he was much attracted by G. F. Knapp's theory he did not accept Knapp's conception of money as a mere medium of circulation but held that the function of money is to serve as a measure of value as well. His course of lectures on money was published in Moscow in 1918 as *Uchenie o den'gakh*; the section which deals with the currency problems in Russia can

by no means be ignored by any student of Russian economics.

MANZONI, ALESSANDRO (1785-1873), Italian poet, novelist and patriot. In his youth Manzoni, a grandson of Cesare Beccaria, came under the influence of Vincenzo Cuoco and Francesco Lomonaco, both of whom had been exiled from Naples after the fall of the Parthenopean Republic and had taken refuge in Milan. All the subsequent political activity and ideas of the great writer were in accord with the conception of Italian unity and independence held and agitated for by these two thinkers. After the conclusion of the period of Napoleonic domination in 1814 he voiced these sentiments in a number of poems which reverberated throughout Italy. His *Liberi non saremo se non siamo uni*, the first lyric of the Risorgimento, was written in 1815 in support of the proposal made by Joachim Murat, king of Naples, that the Italians unite in a single powerful kingdom under Joachim's rule. Manzoni's most ardent patriotic poem was *Marzo 1821*. Evoked by the revolution of the Piedmontese Carbonari in 1821 and dedicated to the German poet-patriot Theodor Körner, this ode prophesied the erasure of all boundaries between the Italian states and the expulsion of the foreigners, who had failed to fulfil their pledges of liberating Italy. Although most of his life was passed in retirement Manzoni emerged on various occasions to take an active part in the struggle for independence and unification and in 1859 he could justly declare that he and Mazzini were among the oldest agitators for the cause. In the posthumously published *La rivoluzione francese del 1789 e la rivoluzione italiana del 1859* he presented a criticism on ethical and legal grounds of the former and a complete justification of the latter.

In addition to the direct influence of his patriotic writings and activities the tremendous popularity enjoyed by some of his more beautiful poems and especially by his immortal romance, *I promessi sposi* (3 vols., Milan 1825-27), made him an important factor in the creation of a moral and intellectual unity among Italians.

I promessi sposi is one of the few works which, like the *Divine Comedy* and the tragedies of Shakespeare, have left an indelible mark on the spirit of a people. Manzoni, who had reacted from the rationalistic influences of his early years and embraced a Catholicism verging on Jansenism, was preoccupied with the moral regeneration of mankind, with the problem of human responsibility for events. As the advocate of human dignity he compares with Dante in the history of Italian culture. *I promessi sposi* has also considerable importance from the historical point of view; the social, economic, political, legal and administrative conditions of seventeenth century Lombardy are portrayed with the intimate knowledge of a researcher and of a man of broad and versatile cultural outlook.

GAETANO MOSCA

Works: *Tutte le opere di Alessandro Manzoni*, ed. by G. Lesca (Florence 1923). His correspondence has been collected in *Carteggio*, ed. by G. Sforza and G. Gallavresi, 2 vols. (Milan 1912-21). A good edition of *I promessi sposi* is that by E. Pistelli (Florence 1930), and a translation appears in the Bohn Library (London 1876).

Gentile (Bari 1922); Gentile, G., *Dante e Manzoni* (Florence 1923); Ruffini, F., *La vita religiosa di Alessandro Manzoni*, 2 vols. (Bari 1931); Croce, B., *Storia della storiografia italiana*, 2 vols. (2nd ed. Bari 1930); Visconti, A., "Il pensiero storiogiuridico di Alessandro Manzoni nelle sue opere" in *Archivio storico Lombardo*, 5th ser., vol. xvi (1919) 382-440; Bulle, O., *Die italienische Einheitsidee in ihrer literarischen Entwicklung von Parini bis Manzoni* (Berlin 1893) p. 205-345.

MAQRĪZI TAQI AL-DĪN AHMAD, AL- (1364-1442), Arab historian. Al-Maqrizi was born at Cairo and educated in the law by his grandfather, a Hanafite; later he went over to the Shafiites and became a vigorous adversary of the school he had originally supported. After serving as judge and teacher of tradition in Cairo he went in 1408 to Damascus as administrator of the *Wuqūf* and about ten years later returned to Cairo to devote himself entirely to writing. His best known work, *Khiṭaṭ (al-Mawa'iz wa al-I'tibār bi Dhikr al-Khiṭaṭ wa al-Athār*, ed. by Gaston Wiet, vols. i-v, Cairo 1911-27; tr. by U. Bouriant and P. Casanova, vols. i-vi, Cairo 1893-1920), representing for the most part a skilful and scholarly compilation of previous histories, deals with the local history and topography of Egypt. It is not only an invaluable source for history and custom but also contains many penetrating and accurate reflections on

philosophy and political economy. Here al-Maqrizi discusses customs duties, rights pertaining to dams and their recent modifications, the apportionment and collection of taxes as well as the system of landholding and the situation of the tenantry. He condemns the system of military fiefs by which the Turks benefit and deplores the formation of a class of "pure fellahs," agricultural workers attached to the soil who live under conditions of actual slavery. As supplements to the *Khīṭaṭ*, al-Maqrizi wrote a history of the Fatimites, *Itti 'āṣ al-Ḥunafa bi-Akḥbār al-A'imma wa al-Khulafa* (Tübingen 1908), and of the Ajobuids and Mamelukes, *Al-Sulūk li-Ma'rifat Duwal al-Mulūk* (tr. by E. M. Quatremère as *Histoire des sultans mam-louks*, 2 vols., Paris 1837-44). Among his lesser writings, his *Nubdhat al-'Uqūd fi Umūr al-Nuqūd* (ed. by O. G. Tychsen, Rostock 1797; tr. by S. de Sacy, rev. ed. Paris 1797), a treatise on Moslem coins, deserves special mention. Of his projected eighty-volume work on the lives of all the rulers and outstanding figures of Egypt, al-Maqrizi completed sixteen volumes, four of which are extant in manuscript form.
